Envelope Bander

The HELIOS 192 is a bander which can be coupled to almost all our envelope machines. The number of envelopes to be banded is variable. In order to guarantee exact counting the envelopes are scanned by a photo-electric cell.

The bands which are fed from a pile can be pre-printed. This bander is an important factor for the economic production of banded envelopes, due to the saving in operators.

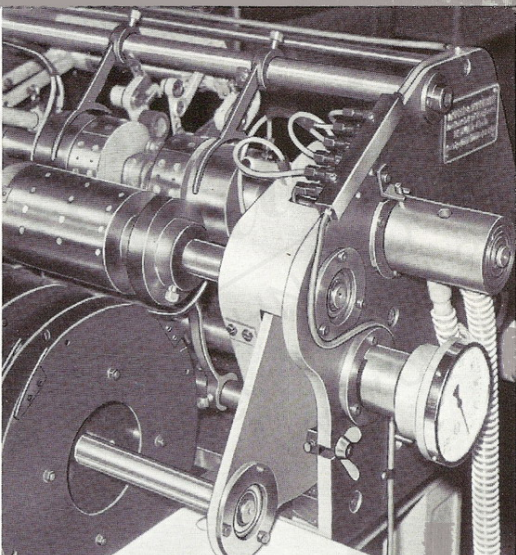

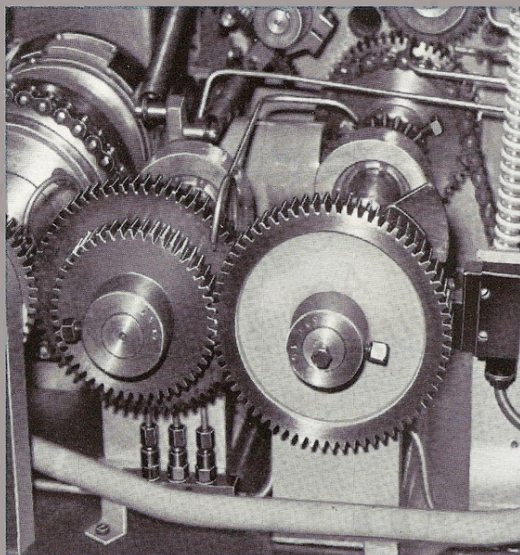

The HELIOS 192 S is a separate bander, working independently from an envelope machine. The feeding system of this machine can be continuously supplied with envelopes which are banded in a predetermined number. The number of envelopes per package is again controlled by a photo-electric scanning device.
