If you suspect malfunction despite the absence of any diagnostic messages on the Field Communicator display, consider using Table 5-1 on page 5-91 to identify any potential problem.

5.2 Safety messages

Procedures and instructions in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that raises potential safety issues is indicated by a warning symbol (⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

5.2.1 Warnings (⚠)

⚠ WARNING

Explosions could result in death or serious injury:

Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the approvals section of the 3051 reference manual for any restrictions associated with a safe installation.

- Before connecting a Field Communicator in an explosive atmosphere, ensure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- In an Explosion-Proof/Flameproof installation, do not remove the transmitter covers when power is applied to the unit.

Process leaks may cause harm or result in death.

- Install and tighten process connectors before applying pressure.

Electrical shock can result in death or serious injury.

- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

Table 5-1. Rosemount 3051 troubleshooting table for 4-20 mA output

Symptom	Corrective actions
Transmitter milliamp reading is zero	Verify power is applied to signal terminals
	Check power wires for reversed polarity
	Verify terminal voltage is 10.5 to 42.4 Vdc
	Check for open diode across test terminal
Transmitter Not Communicating with Field Communicator	Verify the output is between 4 and 20 mA or saturation levels
	Verify terminal voltage is 10.5 to 42.4 Vdc
	Verify clean DC Power to transmitter (Max AC noise 0.2 volts peak to peak)
	Check loop resistance, 250 Ω minimum (PS voltage -transmitter voltage/loop current)
	Have Field Communicator poll for all addresses
Transmitter milliamp reading is low or high	Verify applied pressure
	Verify 4 and 20 mA range points
	Verify output is not in alarm condition
	Verify if 4 – 20 mA output trim is required
Transmitter will not respond to changes in applied pressure	Check test equipment
	Check impulse piping or manifold for blockage
	Verify the transmitter is not in multidrop mode
	Verify applied pressure is between the 4 and 20 mA set points
	Verify output is not in alarm condition
	Verify transmitter is not in Loop Test mode
Digital Pressure Variable reading is low or high	Check test equipment (verify accuracy)
	Check impulse piping for blockage or low fill in wet leg
	Verify transmitter is calibrated properly
	Verify pressure calculations for application
Digital Pressure Variable reading is erratic	Check application for faulty equipment in pressure line
	Verify transmitter is not reacting directly to equipment turning on/off
	Verify damping is set properly for application
Milliamp reading is erratic	Verify power source to transmitter has adequate voltage and current
	Check for external electrical interference
	Verify transmitter is properly grounded
	Verify shield for twisted pair is only grounded at one end

5.3 Diagnostic messages

In addition to the output, the LCD meter displays abbreviated operation, error, and warning messages for troubleshooting the transmitter. Messages appear according to their priority, with normal operating messages appearing last. To determine the cause of a message, use a Field Communicator or AMS to further interrogate the transmitter. A description of each LCD diagnostic message follows.

Error

Error messages appear on the LCD display to inform you of serious problems affecting the operation of the transmitter. The LCD displays an error message until the error condition is corrected, and the analog output is driven to the specified alarm level. No other transmitter information is displayed during an alarm condition.

Fail

The transmitter CPU board and the sensor module are incompatible. See “Disassembly procedures” on page 97.

Fail Module

The sensor module is disconnected or is malfunctioning. Verify that the sensor module ribbon cable is connected to the back of the electronics board. If the ribbon cable is properly connected, there is a problem within the sensor module. Possible sources of problems include:

- Pressure or temperature updates are not being received in the sensor module.
- A non-volatile memory fault that will effect transmitter operation has been detected in the module by the memory verification routine.

Some non-volatile memory faults are user-repairable. Use a Field Communicator to diagnose the error and determine if it is repairable. Any error message that ends in “FACTORY” is not repairable. In cases of non user-repairable errors, you must replace the transmitter.

Fail Elect

The transmitter electronics board is malfunctioning due to an internal fault. Some of the FAIL ELECT errors are user-repairable. Use a 275 Field Communicator to diagnose the error and determine if it is repairable. Any error message that ends in “FACTORY” is not repairable. In cases of non user-repairable errors, you must replace the electronics board. See “Disassembly procedures” on page 97.

Fail Config

A memory fault has been detected in a location that could affect transmitter operation, and is user-accessible. To correct this problem, use a Field Communicator to interrogate and reconfigure the appropriate portion of the transmitter memory.

Warnings

Warnings appear on the LCD display to alert you of user-repairable problems with the transmitter, or current transmitter operations. Warnings appear alternately with other transmitter information until the warning condition is corrected or the transmitter completes the operation that warrants the warning message.

Press Limit

The process variable read by the transmitter is outside of the transmitter's range.

Temp Limit

The secondary temperature variable read by the transmitter is outside of the transmitter's range.

Curr Fixed

The transmitter is in multidrop mode. The analog output is not tracking pressure changes.

Curr Saturd

The pressure read by the module is outside of the specified range, and the analog output has been driven to saturation levels.

Loop Test

A loop test is in progress. During a loop test or 4–20 mA trim, the analog output is set to a fixed value. The meter display alternates between the current selected in milliamps and "LOOP TEST."

Xmtr Info

A non-volatile memory fault has been detected in the transmitter memory by the memory verification routine. The memory fault is in a location containing transmitter information. To correct this problem, use a Field Communicator to interrogate and reconfigure the appropriate portion of the transmitter memory. This warning does not effect the transmitter operation.

Operation

Normal operation messages appear on the LCD meter to confirm actions or inform you of transmitter status. Operation messages are displayed with other transmitter information, and warrant no action to correct or alter the transmitter settings.

Zero Pass

The zero value, set with the local zero adjustment button, has been accepted by the transmitter, and the output should change to 4 mA
(1 Vdc).

Zero Fail

The zero value, set with the local zero adjustment button, exceeds the maximum rangedown allowed for a particular range, or the pressure sensed by the transmitter exceeds the sensor limits.

Span Pass

The span value, set with the local span adjustment button, has been accepted by the transmitter, and the output should change to 20 mA
(5 Vdc).

Span Fail

The span value, set with the local span adjustment button, exceeds the maximum rangedown allowed for a particular range, or the pressure sensed by the transmitter exceeds the sensor limits.

Local Dsbld

This message appears during reranging with the integral zero and span buttons and indicates that the transmitter local zero and span adjustments have been disabled. The adjustments may have been disabled by the transmitter security jumper on the transmitter circuit board or through software commands from the Field Communicator. See "Security (write protect)" on page 20 for information on the position of the security jumper and information on software lockout.

Write Protect

This message appears if you attempt to change the transmitter configuration data while the security jumper is in the ON position. See "Security (write protect)" on page 20 for more information about the security jumper.

Field communicator diagnostics

Table 5-2 is a list of messages used by the Field Communicator (HC) and their corresponding descriptions.

Variable parameters within the text of a message are indicated with <*variable parameter*>.

Reference to the name of another message is identified by *[another message]*.

Table 5-2. Field communicator messages

Message	Description
1k snsr EEPROM error-factory ON	Replace the transmitter
1k snsr EEPROM error-user-no out ON	Use the Field Communicator to reset the following parameters: remote seal isolator, remote seal fill fluid, flange material, o-ring material, transmitter type, remote seal type, flange type, meter type, number of remote seals.
1k snsr EEPROM error-user ON	Perform a full trim to recalibrate the transmitter.
4k micro EEPROM error-factory ON	Replace the electronics board.
4k micro EEPROM error-user-no out ON	Use the Field Communicator to reset the message field.
4k micro EEPROM error-user ON	Use the Field Communicator to reset the following parameters: units, range values, damping, analog output, transfer function, tag, scaled meter values. Perform a D/A trim to ensure that the error is corrected.

Message	Description
4k snsr EEPROM error-factory ON	Replace the transmitter.
4k snsr EEPROM error-user ON	Use the Field Communicator to reset the temperature units and the calibration type.
Add item for ALL device types or only for this ONE device type.	Asks the user whether the hot key item being added should be added for all device types or only for the type of device that is connected.
Command Not Implemented	The connected device does not support this function.
Communication Error	The communicator and the device are not communicating correctly. Check all connections between the Field Communicator and the device and resend the information.
Configuration memory not compatible with connected device	The configuration stored in memory is incompatible with the device to which a transfer has been requested.
CPU board not initialized ON	The electronics board is not initialized. Replace the electronics board.
CPU EEPROM write failure ON	Message sent to electronics board from HART signal failed. Replace the electronics board.
Device Busy	The connected device is busy performing another task.
Device Disconnected	The device failed to respond to a command. Check all connections between the Field Communicator and the device and resend the command.
Device write protected	Device is in write-protect mode. Data can not be written.
Device write protected. Do you still want to shut off?	Device is in write-protect mode. Press YES to turn the Field Communicator off and lose the unsent data.
Display value of variable on hotkey menu?	Asks whether the value of the variable should be displayed adjacent to its label on the hotkey menu if the item being added to the hotkey menu is a variable.
Download data from configuration memory to device	Press the SEND softkey to transfer information from the communicator memory to the device.
Exceed field width	Indicates that the field width for the current arithmetic variable exceeds the device-specified description edit format.
Exceed precision	Indicates that the precision for the current arithmetic variable exceeds the device-specified description edit format.
Ignore next 50 occurrences of status?	Select YES to ignore the next 50 occurrences of device status, or select no to display every occurrence.
Illegal character	An invalid character for the variable type was entered.
Illegal date	The day portion of the date is invalid.
Illegal month	The month portion of the date is invalid.
Illegal year	The year portion of the date is invalid.
Incompatible CPU board and module ON	Upgrade the electronics board or the sensor module to the current revision.
Incomplete exponent	The exponent of a scientific notation floating point variable is incomplete.
Incomplete field	The value entered is not complete for the variable type.

Message	Description
Looking for a device	Polling for multidropped devices at addresses 1–15.
Local buttons operator error ON	Illegal pressure applied during zero or span operation. Repeat the process after verifying the correct pressures.
Mark as read only variable on hotkey menu?	Asks whether the user should be allowed to edit the variable from the hotkey menu if the item being added to the hotkey menu is a variable.
Module EEPROM write failure ON	Message sent to the module from the HART signal failed. Replace the transmitter.
No device configuration in configuration memory	There is no configuration saved in memory available to re-configure off-line or transfer to a device.
No Device Found	Poll of address zero fails to find a device, or poll of all addresses fails to find a device if auto-poll is enabled.
No hotkey menu available for this device.	There is no menu named “hotkey” defined in the device description for this device.
No pressure updates ON	No pressure updates being received from the sensor module. Verify that the sensor module ribbon cable is attached correctly. Or replace the transmitter.
No offline devices available.	There are no device descriptions available to be used to configure a device offline.
No simulation devices available.	There are no device descriptions available to simulate a device.
No temperature updates ON	No temperature updates being received from the sensor module. Verify that the sensor module ribbon cable is attached correctly. Or replace the transmitter.
No UPLOAD_VARIABLES in ddl for this device	There is no menu named “upload_variables” defined in the device description for this device. This menu is required for offline configuration.
No Valid Items	The selected menu or edit display contains no valid items.
OFF KEY DISABLED	Appears when the user attempts to turn the HC off before sending modified data or before completing a method.
Online device disconnected with unsent data. RETRY or OK to lose data.	There is unsent data for a previously connected device. Press RETRY to send data, or press OK to disconnect and lose unsent data.
Out of memory for hotkey configuration. Delete unnecessary items.	There is no more memory available to store additional hotkey items. Unnecessary items should be deleted to make space available.
Overwrite existing configuration memory	Requests permission to overwrite existing configuration either by a device-to-memory transfer or by an offline configuration. User answers using the softkeys.
Press OK...	Press the OK softkey. This message usually appears after an error message from the application or as a result of HART communications.
Restore device value?	The edited value that was sent to a device was not properly implemented. Restoring the device value returns the variable to its original value.
ROM checksum error ON	Checksum of transmitter software has detected a fault. Replace the electronics board.
Save data from device to configuration memory	Prompts user to press SAVE softkey to initiate a device-to-memory transfer.

Message	Description
Saving data to configuration memory.	Data is being transferred from a device to configuration memory.
Sending data to device.	Data is being transferred from configuration memory to a device.
Sensor board not initialized ON	The sensor module electronics board is not initialized. Replace the transmitter.
There are write only variables which have not been edited. Please edit them.	There are write-only variables which have not been set by the user. These variables should be set or invalid values may be sent to the device.
There is unsent data. Send it before shutting off?	Press YES to send unsent data and turn the HC off. Press NO to turn the HC off and lose the unsent data.
Too few data bytes received	Command returns fewer data bytes than expected as determined by the device description.
Transmitter Fault	Device returns a command response indicating a fault with the connected device.
Units for <variable label> has changed. Unit must be sent before editing, or invalid data will be sent.	The engineering units for this variable have been edited. Send engineering units to the device before editing this variable.
Unsent data to online device. SEND or LOSE data	There is unsent data for a previously connected device which must be sent or thrown away before connecting to another device.
Upgrade 275 software to access XMTR function. Continue with old description?	The communicator does not contain the most recent 3051 Device Descriptors (DDs). Select YES to communicate using the existing DDs. Select NO to abort communication.
Use up/down arrows to change contrast. Press DONE when done.	Gives direction to change the contrast of the HC display.
Value out of range	The user-entered value is either not within the range for the given type and size of variable or not within the min/max specified by the device.
<message> occurred reading/writing <variable label>	Either a read/write command indicates too few data bytes received, transmitter fault, invalid response code, invalid response command, invalid reply data field, or failed pre- or post-read method; or a response code of any class other than SUCCESS is returned reading a particular variable.
<variable label> has an unknown value. Unit must be sent before editing, or invalid data will be sent.	A variable related to this variable has been edited. Send related variable to the device before editing this variable.

5.4 Disassembly procedures

⚠ Do not remove the instrument cover in explosive atmospheres when the circuit is live.

5.4.1 Remove from service

Follow these steps:

- Follow all plant safety rules and procedures.
- Isolate and vent the process from the transmitter before removing the transmitter from service.
- Remove all electrical leads and disconnect conduit.
- Remove the transmitter from the process connection.
- The Rosemount 3051C transmitter is attached to the process connection by four bolts and two cap screws. Remove the bolts and separate the transmitter from the process connection. Leave the process connection in place and ready for re-installation.
- The Rosemount 3051T transmitter is attached to the process by a single hex nut process connection. Loosen the hex nut to separate the transmitter from the process. Do not wrench on neck of transmitter.
- Do not scratch, puncture, or depress the isolating diaphragms.
- Clean isolating diaphragms with a soft rag and a mild cleaning solution, and rinse with clear water.
- For the 3051C, whenever you remove the process flange or flange adapters, visually inspect the PTFE o-rings. Replace the o-rings if they show any signs of damage, such as nicks or cuts. Undamaged o-rings may be reused.

5.4.2 Remove terminal block

Electrical connections are located on the terminal block in the compartment labeled "FIELD TERMINALS."

1. Remove the housing cover from the field terminal side.
2. Loosen the two small screws located on the assembly in the 9 o'clock and 5 o'clock positions.
3. Pull the entire terminal block out to remove it.

5.4.3 Remove the electronics board

The transmitter electronics board is located in the compartment opposite the terminal side. To remove the electronics board perform the following procedure:

1. Remove the housing cover opposite the field terminal side.
2. If you are disassembling a transmitter with a LCD display, loosen the two captive screws that are visible on the right and left side of the meter display.
3. ⚠ Loosen the two captive screws that anchor the board to the housing. The electronics board is electrostatically sensitive; observe handling precautions for static-sensitive components. Use caution when removing the LCD as there is an electronic pin connector that interfaces between the LCD and electronics board. The two screws anchor the LCD display to the electronics board and the electronics board to the housing.
4. Using the two captive screws, slowly pull the electronics board out of the housing. The sensor module ribbon cable holds the electronics board to the housing. Disengage the ribbon cable by pushing the connector release.

5.4.4 Remove the sensor module from the electronics housing

1. Remove the electronics board. Refer to "Remove the electronics board" on page 99.

Important
To prevent damage to the sensor module ribbon cable, disconnect it from the electronics board before you remove the sensor module from the electrical housing.

2. Carefully tuck the cable connector completely inside of the internal black cap.

⚠ See "Safety messages" on page 89 for complete warning

Note
Do not remove the housing until after you tuck the cable connector completely inside of the internal black cap. The black cap protects the ribbon cable from damage that can occur when you rotate the housing.

3. Loosen the housing rotation set screw with a $^{5}/_{64}$-inch hex wrench, and loosen one full turn.
4. Unscrew the module from the housing, making sure the black cap and sensor cable do not catch on the housing.

5.5 Reassembly procedures

1. Inspect all cover and housing (non-process wetted) O-rings and replace if necessary. Lightly grease with silicone lubricant to ensure a good seal.
2. Carefully tuck the cable connector completely inside the internal black cap. To do so, turn the black cap and cable counterclockwise one rotation to tighten the cable.
3. Lower the electronics housing onto the module. Guide the internal black cap and cable through the housing and into the external black cap.
4. Turn the module clockwise into the housing.

Important
Make sure the sensor ribbon cable and internal black cap remain completely free of the housing as you rotate it. Damage can occur to the cable if the internal black cap and ribbon cable become hung up and rotate with the housing.

⚠ 5. Thread the housing completely onto the sensor module. The housing must be no more than one full turn from flush with the sensor module to comply with explosion proof requirements.
6. Tighten the housing rotation set screw using a $^{5}/_{64}$-inch hex wrench.

5.5.1 Attach the electronics board

1. Remove the cable connector from its position inside of the internal black cap and attach it to the electronics board.
2. Using the two captive screws as handles, insert the electronics board into the housing. Make sure the posts from the electronics housing properly engage the receptacles on the electronics board. Do not force. The electronics board should slide gently on the connections.
3. Tighten the captive mounting screws.

⚠ 4. Replace the electronics housing cover. The transmitter covers must be engaged metal-to-metal to ensure a proper seal and to meet Explosion-Proof requirements.

⚠ See “Safety messages” on page 89 for complete warning

5.5.2 Install the terminal block

1. Gently slide the terminal block into place, making sure the two posts from the electronics housing properly engage the receptacles on the terminal block.
2. Tighten the captive screws.
3. Replace the electronics housing cover. The transmitter covers must be fully engaged to meet Explosion-Proof requirements.

5.5.3 Reassemble the 3051C process flange

1. Inspect the sensor module PTFE o-rings. Undamaged o-rings may be reused. Replace o-rings that show any signs of damage, such as nicks, cuts, or general wear.

Note
If you are replacing the o-rings, be careful not to scratch the o-ring grooves or the surface of the isolating diaphragm when removing the damaged o-rings.

2. Install the process connection. Possible options include:
   a. Coplanar Process Flange:
      – Hold the process flange in place by installing the two alignment screws to finger tightness (screws are not pressure retaining). Do not overtighten as this will affect module-to-flange alignment.
      – Install the four 1.75-in. flange bolts by finger tightening them to the flange.
   b. Coplanar Process Flange with Flange Adapters:
      – Hold the process flange in place by installing the two alignment screws to finger tightness (screws are not pressure retaining). Do not overtighten as this will affect module-to-flange alignment.
      – Hold the flange adapters and adapter o-rings in place while installing the four configurations, use four 2.88-in. bolts. For gage pressure configurations, use two 2.88-in. bolts and two 1.75-in. bolts.
   c. Manifold:
      – Contact the manifold manufacturer for the appropriate bolts and procedures.
3. Tighten the bolts to the initial torque value using a crossed pattern. See Table 5-3 for appropriate torque values.

Table 5-3. Bolt installation torque values

Bolt material	Initial torque value	Final torque value
CS-ASTM-A445 Standard	300 in-lb. (34 N-m)	650 in-lb. (73 N-m)
316 SST—Option L4	150 in-lb. (17 N-m)	300 in-lb. (34 N-m)
ASTM-A-19 B7M—Option L5	300 in-lb. (34 N-m)	650 in-lb. (73 N-m)
ASTM-A-193 Class 2, Grade B8M—Option L8	150 in.-lb (17 N-m)	300 in.-lb (34 N-m)

Note
If you replaced the PTFE sensor module o-rings, re-torque the flange bolts after installation to compensate for cold flow.

Note
After replacing o-rings on Range 1 transmitters and re-installing the process flange, expose the transmitter to a temperature of 185 °F (85 °C) for two hours. Then re-tighten the flange bolts in a cross pattern, and again expose the transmitter to a temperature of 185 °F (85 °C) for two hours before calibration.

5.5.4 Install the drain/vent valve

1. Apply sealing tape to the threads on the seat. Starting at the base of the valve with the threaded end pointing toward the installer, apply two clockwise turns of sealing tape.
2. Tighten the drain/vent valve to 250 in-lb. (28.25 N-m).
3. Take care to place the opening on the valve so that process fluid will drain toward the ground and away from human contact when the valve is opened.

Appendix A Specifications and reference data

Performance specifications . . . . . **page 103**
Functional specifications . . . . . **page 108**
Physical specifications . . . . . **page 116**
Dimensional Drawings . . . . . **page 120**
Ordering Information . . . . . **page 131**
Options . . . . . **page 156**
Spare parts . . . . . **page 164**

A.1 Performance specifications

This product data sheet covers both HART and fieldbus protocols unless specified.

A.1.1 Conformance to specification (±3σ (Sigma))

Technology leadership, advanced manufacturing techniques and statistical process control ensure specification conformance to at least ±3σ.

A.1.2 Reference accuracy[1]

Models[1]	Standard	High Accuracy Option
3051CD, 3051CG Range 0 (CD)	±0.10% of span For spans less than 2:1, accuracy = ±0.05% of URL	
Range 1	±0.10% of span For spans less than 15:1, accuracy = $\pm\left[0.025 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span	
Ranges 2-5	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.015 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 2-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.015 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span
3051T Ranges 1-4	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 1-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span
Range 5	±0.075% of span	
3051CA Ranges 1-4	±0.065% of span For spans less than 10:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span	Ranges 2-4 High Accuracy Option, P8 ±0.04% of span For spans less than 5:1, accuracy = $\pm\left[0.0075\left(\frac{URL}{Span}\right)\right]$% of Span
3051H/3051L All Ranges	±0.075% of span For spans less than 10:1, accuracy = $\pm\left[0.025 + 0.005\left(\frac{URL}{Span}\right)\right]$% of Span	

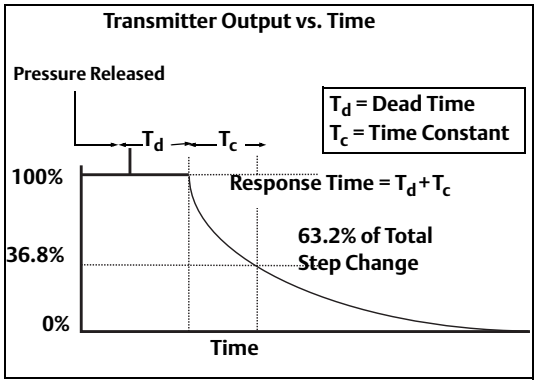
(1) Total performance is determined by performing a root sum square calculation on reference accuracy, ambient temperature effect, and line pressure effect errors. For FOUNDATION fieldbus transmitters, use calibrated range in place of span. For zero based spans, reference conditions, silicone oil fill, SST materials, Coplanar flange (3051C) or 1/2 in. - 18 NPT (3051T) process connections, digital trim values set to equal range points.

A.1.3 Total performance

For ±50 °F (28 °C) temperature changes, up to 1000 psi (6,9 MPa) line pressure (CD only), from 1:1 to 5:1 rangedown.

Models	Total Performance
3051C Ranges 2-5	±0.15% of span
3051T Ranges 1-4	±0.15% of span

A.1.4 Long term stability



Models	Long Term Stability
3051C Ranges 2-5	±0.125% of URL for 5 years ±50 °F (28 °C) temperature changes, and up to 1000 psi (6,9 MPa) line pressure.
3051CD Low/Draft Range Ranges 0-1	±0.2% of URL for 1 year
3051T Ranges 1-4	±0.125% of URL for 5 years ±50 °F (28 °C) temperature changes, and up to 1000 psi (6,9 MPa) line pressure.
Rosemount 3051H Ranges 2-3 Ranges 4-5	 ±0.1% of URL for 1 year ±0.2% of URL for 1 year

A.1.5 Dynamic performance

	4 - 20 mA (*HART* protocol)[1]	Fieldbus protocol[3]
Total Response Time ($T_d + T_c$)[2]:		
3051C, Ranges 2-5: Range 1: Range 0: 3051T: 3051H/L:	100 ms 255 ms 700 ms 100 ms Consult factory	152 ms 307 ms 752 ms 152 ms Consult factory
Dead Time (Td)	45 ms (nominal)	97 ms
Update Rate	22 times per second	22 times per second

(1) Dead time and update rate apply to all models and ranges; analog output only
(2) Nominal total response time at 75 °F (24 °C) reference conditions.
(3) Transmitter fieldbus output only, segment macro-cycle not included.

Typical HART Transmitter Response Time

A.1.6 Line pressure effect per 1000 psi (6,9 MPa)[1]

Models[1]	Line Pressure Effect
3051CD Range 0	Zero Error[2] ±0.125% of URL/100 psi (6,89 bar)
Range 1	±0.25% of URL/1000 psi (68,9 bar)
Ranges 2-3	±0.05% of URL/1000 psi (68,9 bar) for line pressures from 0 to 2000 psi (0 to 13,7 MPa)
Range 0	Span Error ±0.15% of reading/100 psi (6,89 bar)
Range 1	±0.4% of reading/1000 psi (68,9 bar)
Ranges 2-3	±0.1% of reading/1000 psi (68,9 bar)

Models[1]	Line Pressure Effect
3051HD All Ranges	Zero Error[1] ±0.1% of URL/1000 psi (68,9 bar) for line pressures from 0 to 2000 psi (0 to 13,7 MPa)
All Ranges	Span Error ±0.1% of reading/1000 psi (68,9 bar)

(1) For zero error specifications for line pressures above 2000 psi (137,9 bar) or line pressure effect specifications for DP Ranges 4-5, see "Compensating for Line Pressure" on page 13.
(2) Can be calibrated out at line pressure.

A.1.7 Ambient temperature effect per 50 °F (28 °C)

Models	Ambient Temperature Effect
3051CD/CG Range 0	±(0.25% URL + 0.05% span)
Range 1	±(0.1% URL + 0.25% span)
Ranges 2-5	±(0.0125% URL + 0.0625% span) from 1:1 to 5:1 ±(0.025% URL + 0.125% span) from 5:1 to 100:1
3051T Range 1	±(0.025% URL + 0.125% span) from 1:1 to 10:1 ±(0.05% URL + 0.125% span) from 10:1 to 100:1
Range 2-4	±(0.025% URL + 0.125% span) from 1:1 to 30:1 ±(0.035% URL + 0.125% span) from 30:1 to 100:1

3051L	See Rosemount Inc. Instrument Toolkit® software.

A.1.8 Mounting position effects

Models	Mounting Position Effects
3051C	Zero shifts up to ±1.25 inH_2O (3,11 mbar), which can be calibrated out. No span effect.
3051H	Zero shifts up to ±5 inH_2O (12,43 mbar), which can be calibrated out. No span effect.
3051L	With liquid level diaphragm in vertical plane, zero shift of up to 1 inH_2O (2,49 mbar). With diaphragm in horizontal plane, zero shift of up to 5 inH_2O (12,43 mbar) plus extension length on extended units. All zero shifts can be calibrated out. No span effect.
3051T/CA	Zero shifts up to 2.5 inH_2O (6,22 mbar), which can be calibrated out. No span effect.

A.1.9 Vibration effect

Less than ±0.1% of URL when tested per the requirements of IEC60770-1 field or pipeline with high vibration level (10-60 Hz 0.21mm displacement peak amplitude / 60-2000 Hz 3g).

A.1.10 Power supply effect

Less than ±0.005% of calibrated span per volt.

A.1.11 Electromagnetic compatibility (EMC)

Meets all relevant requirements of EN 61326 and NAMUR NE-21.

A.1.12 Transient protection (option code T1)

Meets IEEE C62.41, Category Location B

6 kV crest (0.5 μs - 100 kHz)
3 kV crest (8 × 20 microseconds)
6 kV crest (1.2 × 50 microseconds)

A.2 Functional specifications

A.2.1 Range and sensor limits

Table A-1. 3051CD, 3051CG, 3051L, and 3051H range and sensor limits

Range	Minimum span	
	3051CD[(1)], CG, L, H	Upper (URL)
0	0.1 inH2O (0,25 mbar)	3.0 inH2O(7,47 mbar)
1	0.5 inH2O (1,2 mbar)	25 inH2O(62,3 mbar)
2	2.5 inH2O (6,2 mbar)	250 inH2O (0,62 bar)
3	10 inH2O (24,9 mbar)	1000 inH2O (2,49 bar)
4	3 psi (0,20 bar)	300 psi (20,6 bar)
5	20 psi (1,38 bar)	2000 psi (137,9 bar)

(1) Range 0 only available with 3051CD. Range 1 only available with 3051CD or 3051CG.

Table A-2. 3051CD, 3051CG, 3051L, and 3051H range and sensor limits (cont.)

Range	Range and sensor limits					
	Lower (LRL)					
	3051C differential	3051C/ gage	3051L differential	3051L gage	3051H differential	3051H gage
0	–3.0 inH2O (-7,47 mbar)	NA	NA	NA	NA	NA
1	–25 inH2O (–62,1 mbar)	–25 inH2O (–62,1 mbar)	NA	NA	NA	NA
2	–250 inH2O (–0,62 bar)	–250 inH2O (–0,62 bar)	–250 inH2O (–0,62 bar)	–250 inH2O (–0,62 bar)	–250 inH2O (–0,62 bar)	–250 inH2O (–0,62 bar)
3	–1000 inH2O (–2,49 bar)	0.5 psia (34,5 mbar abs)	–1000 inH2O (–2,49 bar)	0.5 psia (34,5 mbar abs)	–1000 inH2O (–2,49 bar)	0.5 psia (34,5 mbar abs)
4	–300 psi (–20,6 bar)	0.5 psia (34,5 mbar abs)	–300 psi (–20,6 bar)	0.5 psia (34,5 mbar abs)	–300 psi (–20,6 bar)	0.5 psia (34,5 mbar abs)
5	– 2000 psi (–137,9 bar)	0.5 psia (34,5 mbar abs)	NA	NA	– 2000 psi (–137,9 bar)	0.5 psia (34,5 mbar abs)

Table A-3. Range and sensor limits

3051CA				3051T				
Range	Minimum span	Range and sensor limits		Range	Minimum span	Range and sensor limits		Lower[1] (LRL) (Gage)
		Upper (URL)	Lower (LRL)			Upper (URL)	Lower (LRL)	
1	0.3 psia (20,6 mbar)	30 psia (2,07 bar)	0 psia (0 bar)	1	0.3 psi (20,6 mbar)	30 psi (2,07 bar)	0 psia (0 bar)	–14.7 psig (–1,01 bar)
2	1.5 psia (0,103 bar)	150 psia (10,3 bar)	0 psia (0 bar)	2	1.5 psi (0,103 bar)	150 psi (10,3 bar)	0 psia (0 bar)	–14.7 psig (–1,01 bar)
3	8 psia (0,55 bar)	800 psia (55,2 bar)	0 psia (0 bar)	3	8 psi (0,55 bar)	800 psi (55,2 bar)	0 psia (0 bar)	–14.7 psig (–1,01 bar)
4	40 psia (2,76 bar)	4000 psia (275,8 bar)	0 psia (0 bar)	4	40 psi (2,76 bar)	4000 psi (275,8 bar)	0 psia (0 bar)	–14.7 psig (–1,01 bar)
				5	2000 psi (137,9 bar)	10000 psi (689,4 bar)	0 psia (0 bar)	–14.7 psig (–1,01 bar)

(1) Assumes atmospheric pressure of 14.7 psig.

A.2.2 Zero and Span Adjustment Requirements (*HART* and Low Power)

Zero and span values can be set anywhere within the range limits stated in Table A-1, Table A-2, and Table A-3.

Span must be greater than or equal to the minimum span stated in Table A-1, Table A-2, and Table A-3.

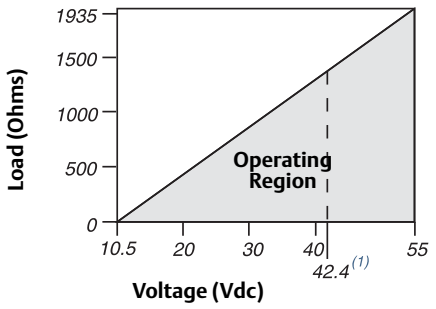
A.2.3 Service

Liquid, gas, and vapor applications

A.2.4 4–20 mA (Output Code A)

Output

Two-wire 4–20 mA, user-selectable for linear or square root output. Digital process variable superimposed on 4–20 mA signal, available to any host that conforms to the *HART* protocol.



Power Supply

External power supply required. Standard transmitter (4–20 mA) operates on 10.5 to 55 Vdc with no load.

Load Limitations

Maximum loop resistance is determined by the voltage level of the external power supply, as described by:

Max. Loop Resistance = 43.5 (Power Supply Voltage – 10.5)

Communication requires a minimum loop resistance of 250 ohms.

(1) *For CSA approval, power supply must not exceed 42.4 V.*

A.2.5 FOUNDATION fieldbus (output code F) and Profibus (output code W)

Power Supply

External power supply required; transmitters operate on 9.0 to 32.0 Vdc transmitter terminal voltage.

Current Draw

17.5 mA for all configurations (including LCD display option)

A.2.6 FOUNDATION fieldbus function block execution times

Block	Execution Time
Resource	-
Transducer	-
LCD Block	-
Analog Input 1, 2	30 milliseconds
PID	45 milliseconds
Input Selector	30 milliseconds
Arithmetic	35 milliseconds
Signal Characterizer	40 milliseconds
Integrator	35 milliseconds

A.2.7 FOUNDATION fieldbus Parameters

Schedule Entries	7 (max.)
Links	20 (max.)
Virtual Communications Relationships (VCR)	12 (max.)

A.2.8 Standard Function Blocks

Resource Block

Contains hardware, electronics, and diagnostic information.

Transducer Block

Contains actual sensor measurement data including the sensor diagnostics and the ability to trim the pressure sensor or recall factory defaults.

LCD Block

Configures the local display.

2 Analog Input Blocks

Processes the measurements for input into other function blocks. The output value is in engineering units or custom and contains a status indicating measurement quality.

PID Block

Contains all logic to perform PID control in the field including cascade and feedforward.

A.2.9 Backup Link Active Scheduler (LAS)

The transmitter can function as a Link Active Scheduler if the current link master device fails or is removed from the segment.

A.2.10 Advanced control function block suite (Option Code A01)

Input Selector Block

Selects between inputs and generates an output using specific selection strategies such as minimum, maximum, midpoint, average or first "good."

Arithmetic Block

Provides pre-defined application-based equations including flow with partial density compensation, electronic remote seals, hydrostatic tank gauging, ratio control and others.

Signal Characterizer Block

Characterizes or approximates any function that defines an input/output relationship by configuring up to twenty X, Y coordinates. The block interpolates an output value for a given input value using the curve defined by the configured coordinates.

Integrator Block

Compares the integrated or accumulated value from one or two variables to pre-trip and trip limits and generates discrete output signals when the limits are reached. This block is useful for calculating total flow, total mass, or volume over time.

A.2.11 FOUNDATION fieldbus Diagnostics Suite (Option Code D01)

The 3051C FOUNDATION fieldbus Diagnostics provide Abnormal Situation Prevention (ASP) indictation. The integral statistical process monitoring (SPM) technology calculates the mean and standard deviation of the process variable 22 times per second. The 3051C ASP algorithm uses these values and highly flexible configuration options for customization to many user-defined or application specific abnormal situations. The detection of plugged impulse lines is the first available predefined application.

A.2.12 Low Power (output code M)

Output

Three wire 1–5 Vdc or 0.8–3.2 Vdc (Option Code C2) user-selectable output. Also user selectable for linear or square root output configuration. Digital process variable superimposed on voltage signal, available to any host conforming to the *HART* protocol. Low-power transmitter operates on 6–14 Vdc with no load.

Power Consumption

3.0 mA, 18–36 mW

Minimum Load Impedance

100 kΩ (V_{out} wiring)

Indication

Optional 5-digit LCD display

Overpressure Limits

Rosemount 3051CD/CG

- Range 0: 750 psi (51,7 bar)
- Range 1: 2000 psig (137,9 bar)
- Ranges 2–5: 3626 psig (250 bar)
  4500 psig (310,3 bar) for option code P9

Rosemount 3051CA

- Range 1: 750 psia (51,7 bar)
- Range 2: 1500 psia (103,4 bar)
- Range 3: 1600 psia (110,3 bar)
- Range 4: 6000 psia (413,7 bar)

Rosemount 3051H

- All Ranges: 3626 psig (25 MPa)

Rosemount 3051TG/TA

- Range 1: 750 psi (51,7 bar)
- Range 2: 1500 psi (103,4 bar)
- Range 3: 1600 psi (110,3 bar)
- Range 4: 6000 psi (413,7 bar)
- Range 5: 15000 psi (1034,2 bar)

For 3051L or Level Flange Option Codes FA, FB, FC, FD, FP, and FQ, limit is 0 psia to the flange rating or sensor rating, whichever is lower.

Table A-4. 3051L and level flange rating limits

Standard	Type	CS rating	SST rating
ANSI/ASME	Class 150	285 psig	275 psig
ANSI/ASME	Class 300	740 psig	720 psig
ANSI/ASME	Class 600	1480 psig	1440 psig
At 100 °F (38 °C), the rating decreases with increasing temperature.			
DIN	PN 10–40	40 bar	40 bar
DIN	PN 10/16	16 bar	16 bar
DIN	PN 25/40	40 bar	40 bar
At 248 °F (120 °C), the rating decreases with increasing temperature.			

A.2.13 Static Pressure Limit

Rosemount 3051CD Only

Operates within specifications between static line pressures of 0.5 psia and 3626 psig (4500 psig (310, 3 bar) for
Option Code P9).

Range 0: 0.5 psia and 750 psig (3, 4 bar and 51, 7 bar)

Range 1: 0.5 psia and 2000 psig (3, 4 bar and 137, 9 bar)

A.2.14 Burst Pressure Limits

Burst pressure on Coplanar, traditional, or 3051H process flange is 10000 psig (69 MPa).

Burst pressure for the 3051T is:

Ranges 1–4: 11000 psi (75,8 MPa)

Range 5: 26000 psig (179 MPa)

A.2.15 Failure Mode Alarm

Output Code A

If self-diagnostics detect a gross transmitter failure, the analog signal will be driven either below 3.75 mA or to 21.75 mA to alert the user. NAMUR-compliant values are available, option code C4. High or low alarm signal is user-selectable by internal jumper.

Output Code M

If self-diagnostics detect a gross transmitter failure, the analog signal will be driven either below 0.94 V or above 5.4 V to alert the user (below 0.75 V or above 4.4 V for Option C2). High or low alarm signal is user-selectable by internal jumper.

Output Code F and W

If self-diagnostics detect a gross transmitter failure, that information gets passed as a status along with the process variable.

A.2.16 Temperature Limits

Ambient

–40 to 185 °F (–40 to 85 °C)

With LCD display[1]: –40 to 175 °F (–40 to 80 °C)

Storage

–50 to 230 °F (–46 to 110 °C)

With LCD display: –40 to 185 °F (–40 to 85 °C)

Process

At atmospheric pressures and above. See Table A-5

(1) LCD display may not be readable and LCD updates will be slower at temperatures below -4 °F (-20 °C).

Table A-5. 3051 process temperature limits

3051CD, 3051CG, 3051CA	
Silicone Fill Sensor[1]	
with Coplanar Flange	–40 to 250 °F (–40 to 121 °C)[2]
with Traditional Flange	–40 to 300 °F (–40 to 149 °C)[2][3]
with Level Flange	–40 to 300 °F (–40 to 149 °C)[2]
with 305 Integral Manifold	–40 to 300 °F (–40 to 149 °C)[2]
Inert Fill Sensor[1]	-40 to 185 °F (–40 to 85 °C)[4][5]
3051H (process fill fluid)	
D.C.® Silicone 200[1]	–40 to 375 °F (–40 to 191 °C)
Inert[1]	–50 to 350 °F (–45 to 177 °C)
Neobee M-20®[1]	0 to 375 °F (–18 to 191 °C)
3051T (process fill fluid)	
Silicone Fill Sensor[1]	–40 to 250 °F (–40 to 121 °C)[2]
Inert Fill Sensor[1]	–22 to 250 °F (–30 to 121 °C)[2]
3051L low-side temperature limits	
Silicone Fill Sensor[1]	–40 to 250 °F (–40 to 121 °C)[2]
Inert Fill Sensor[1]	0 to 185 °F (–18 to 85 °C)[2]

3051L high-side temperature limits (process fill fluid)	
Sylltherm® XLT	–100 to 300 °F (–73 to 149 °C)
D.C. Silicone 704®	32 to 400 °F (0 to 205 °C)
D.C. Silicone 200	–40 to 400 °F (–40 to 205 °C)
Inert	–50 to 350 °F (–45 to 177 °C)
Glycerin and Water	0 to 200 °F (–18 to 93 °C)
Neobee M-20	0 to 400 °F (–18 to 205 °C)
Propylene Glycol and Water	0 to 200 °F (–18 to 93 °C)

(1) Process temperatures above 185 °F (85 °C) require derating the ambient limits by a 1.5:1 ratio (0.6:1 ratio for the 3051H).
(2) 220 °F (104 °C) limit in vacuum service; 130 °F (54 °C) for pressures below 0.5 psia.
(3) 3051CD0 process temperature limits are –40 to 212 °F (–45 to 100 °C)
(4) 160 °F (71 °C) limit in vacuum service.
(5) Not available for 3051CA.

Humidity Limits

0–100% relative humidity

Turn-On Time

Performance within specifications less than 2.0 seconds (10.0 s for Profibus protocol) after power is applied to the transmitter

Volumetric Displacement

Less than 0.005 in^3 (0,08 cm^3)

Damping

Analog output response to a step input change is user-selectable from 0 to 36 seconds for one time constant. This software damping is in addition to sensor module response time.

A.3 Physical specifications

A.3.1 Electrical Connections

1/2–14 NPT, G1/2, and M20 × 1.5 (CM20) conduit. HART interface connections fixed to terminal block.

A.3.2 Process Connections

All Models except 3051L and 3051T

1/4–18 NPT on 2 1/8-in. centers

1/2–14 NPT on 2-, 2 1/8-, or 2 1/4-in. centers

Rosemount 3051L

High pressure side: 2-, 3-, or 4-in., ASME B 16.5 (ANSI) Class 150, 300 or 600 flange; 50, 80 or 100 mm, PN 40 or 10/16 flange

Low pressure side: 1/4–18 NPT on flange 1/2–14 NPT on adapter

Rosemount 3051T

1/2–14 NPT female. A DIN 16288 Male (available in SST for Range 1–4 transmitters only), or Autoclave type F-250-C (Pressure relieved 9/16–18 gland thread; 1/4 OD high pressure tube 60° cone; available in SST for Range 5 transmitters only).

A.3.3 Process-Wetted Parts

Drain/Vent Valves

316 SST, Alloy C-276, or Alloy 400/K-500(1) material
(Drain vent seat: Alloy 400, Drain vent stem: Alloy K-500)

(1)Alloy 400/K-500 is not available with 3051L or 3051H.

Process Flanges and Adapters

Plated carbon steel
SST: CF-8M (Cast 316 SST) per ASTM A743
Cast C-276: CW-12MW per ASTM A494
Cast Alloy 400: M-30C per ASTM A494

Wetted O-rings

Glass-filled PTFE or Graphite-filled PTFE

Process Isolating Diaphragms

Isolating diaphragm material	3051CD/CG	3051T	3051CA	3051H
316L SST	•	•	•	•

A.3.4 Rosemount 3051L Process Wetted Parts

Flanged Process Connection (Transmitter High Side)

Process Diaphragms, Including Process Gasket Surface

- 316L SST, Alloy C-276, or Tantalum
- Extension
- CF-3M (Cast version of 316L SST, material per ASTM-A743), or Alloy C-276. Fits schedule 40 and 80 pipe.
- Mounting Flange
- Zinc-cobalt plated CS or SST

Reference Process Connection (Transmitter Low Side)

Isolating Diaphragms

- 316L SST or Alloy C-276

Reference Flange and Adapter

- CF-8M (Cast version of 316 SST, material per ASTM-A743)

A.3.5 Non-Wetted Parts

Electronics Housing

Low copper aluminum or SST: CF-3M or CF-8M (Cast version of 316L or 316 SST, material per ASTM-A743). NEMA 4X, IP 65, IP 66

Coplanar Sensor Module Housing

CF-3M (Cast version of 316L SST, material per ASTM-A743)

Bolts

ASTM A449, Type 1 (zinc-cobalt plated carbon steel)
ASTM F593G, Condition CW1 (Austenitic 316 SST)
ASTM A193, Grade B7M (zinc plated alloy steel)
Alloy 400

Sensor Module Fill Fluid

Silicone oil (D.C. 200) or Fluorocarbon oil (Halocarbon or Fluorinert® FC-43 for 3051T)

Process Fill Fluid (3051L and 3051H only)

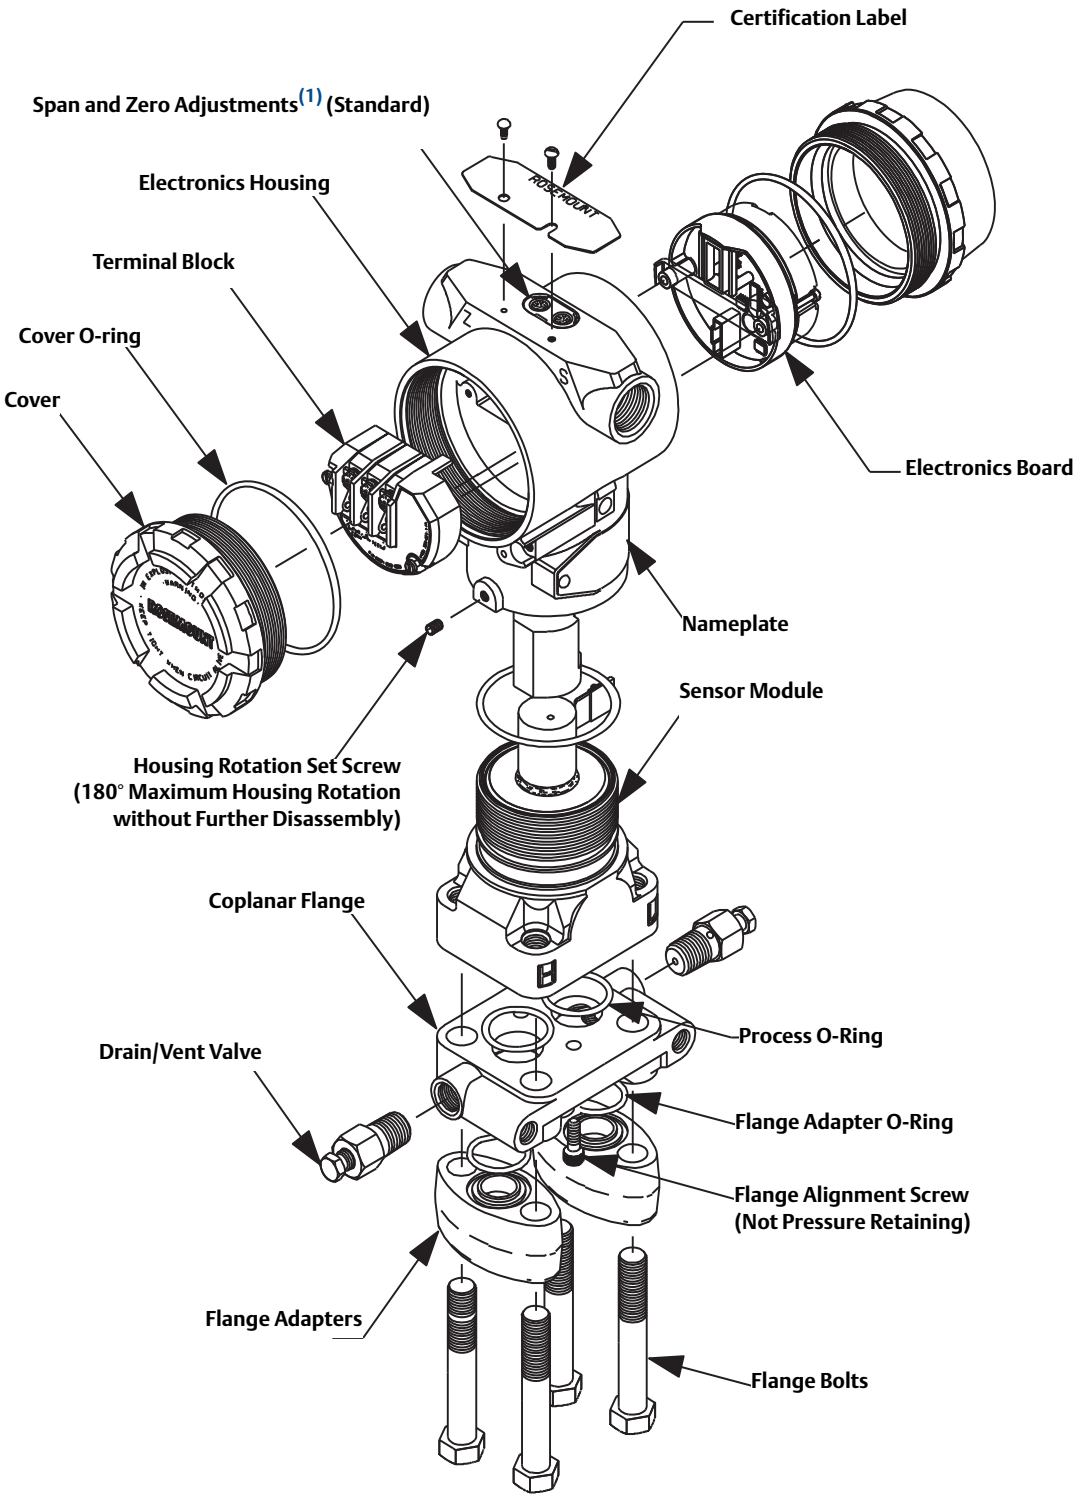
3051L: Syltherm XLT, D.C. Silicone 704,
D.C. Silicone 200, inert, glycerin and water, Neobee M-20 or propylene glycol and water

3051H: inert, Neobee M-20, or D.C. Silicone 200

Paint

Polyurethane

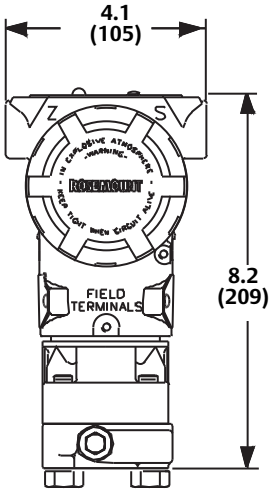
Cover O-rings



Buna-N

A.3.6 Shipping Weights

Refer to "Shipping weights" on page 159.



A.4 Dimensional Drawings

A.5.1 Options (Include with selected model number)

Plantweb Control Functionality		
Standard		**Standard**
A01	FOUNDATION fieldbus Advanced Control Function Block Suite	★
Plantweb Diagnostic Functionality		
Standard		**Standard**
D01	FOUNDATION fieldbus Diagnostics Suite	★
Alternate Flange		
Standard		**Standard**
H2	Traditional Flange, 316 SST, SST Drain/Vent	★
H3(5)	Traditional Flange, Alloy C, Alloy C-276 Drain/Vent	★
H4	Traditional Flange, Monel, Monel Drain/Vent	★
H7(5)	Traditional Flange, 316 SST, Alloy C-276 Drain/Vent	★
HJ	DIN Compliant Traditional Flange, SST, 1/16 in. Adapter/Manifold Bolting	★
FA	Level Flange, SST, 2 in., ANSI Class 150, Vertical Mount	★
FB	Level Flange, SST, 2 in., ANSI Class 300, Vertical Mount	★
FC	Level Flange, SST, 3 in., ANSI Class 150, Vertical Mount	★
FD	Level Flange, SST, 3 in., ANSI Class 300, Vertical Mount	★
FP	DIN Level Flange, SST, DN 50, PN 40, Vertical Mount	★
FQ	DIN Level Flange, SST, DN 80, PN 40, Vertical Mount	★
Expanded		
HK	DIN Compliant Traditional Flange, SST, 10 mm Adapter/Manifold Bolting	
HL	DIN Compliant Traditional Flange, SST, 12mm Adapter/Manifold Bolting (Not available on 3051CD0)	
Integral Assembly		
Standard		**Standard**
S3(6)	Assemble to Rosemount 405 Compact Orifice Plate	★
S5(6)	Assemble to Rosemount 305 Integral Manifold (specified separately, see the Rosemount 305 and 306 Integral Manifolds PDS (document number 00813-0100-4733))	★
S6(6)	Assemble to Rosemount 304 Manifold or Connection System	★

Integral Mount Primary Element		
Standard		**Standard**
S4[(6)]	Assemble to Rosemount Annubar or Rosemount 1195 Integral Orifice *(With the primary element installed, the maximum operating pressure will equal the lesser of either the transmitter or the primary element. Option is available for factory assembly to range 1–4 transmitters only)*	★
Seal Assemblies		
Standard		**Standard**
S1[(6)]	Assemble to one Rosemount 1199 seal	★
S2[(6)]	Assemble to two Rosemount 1199 seals	★
All-Welded Seal Assemblies (for high vacuum applications)		
Standard		**Standard**
S0[(6)]	One Seal, All-Welded System (Direct Mount Connection Type)	★
S7[(6)]	One Seal, All-Welded System (Capillary Connection Type)	★
S8[(6)]	Two Seals, All-Welded System (Capillary Connection Type)	★
S9[(6)]	Two Seals, All-Welded System (One Direct Mount and One Capillary Connection Type)	★
Mounting Bracket		
Standard		**Standard**
B1	Traditional Flange Bracket for 2-in. Pipe Mounting, CS Bolts	★
B2	Traditional Flange Bracket for Panel Mounting, CS Bolts	★
B3	Traditional Flange Flat Bracket for 2-in. Pipe Mounting, CS Bolts	★
B4	Coplanar Flange Bracket for 2-in. Pipe or Panel Mounting, all SST	★
B7	B1 Bracket with Series 300 SST Bolts	★
B8	B2 Bracket with Series 300 SST Bolts	★
B9	B3 Bracket with Series 300 SST Bolts	★
BA	SST B1 Bracket with Series 300 SST Bolts	★
BC	SST B3 Bracket with Series 300 SST Bolts	★
Product Certifications		
Standard		**Standard**
C6	CSA Explosion-proof, Dust Ignition-proof, Intrinsically Safe, and Division 2	★
E2	INMETRO Flameproof	★

IA	ATEX FISCO Intrinsic Safety; for FOUNDATION fieldbus protocol only	★
IE	FM FISCO Intrinsically Safe; for FOUNDATION fieldbus protocol only	★
K2	INMETRO Flameproof, Instrinsic Safety	★
K5	FM Explosion-proof, Dust Ignition-Proof, Intrinsically Safe, and Division 2	★
K6[7]	CSA and ATEX Explosion-proof, Intrinsically Safe, and Division 2 (combination of C6 and K8)	★
K7[7]	IECEx Flame-proof, Dust Ignition-proof, Intrinsic Safety, and Type n (combination of I7, N7, and E7)	★
K8[12]	ATEX Flameproof, Intrinsic Safety, Type n, Dust (combination of E8, I1, and N1)	★
KB	FM and CSA Explosion-proof, Dust Ignition Proof, Intrinsically Safe, and Division 2 (combination of K5 and C6)	★
KD[12]	FM, CSA, and ATEX Explosion-proof, Intrinsically Safe (combination of K5, C6, I1, and E8)	★
N1[12]	ATEX Type n and Dust	★
N3	China Type n	★
N7[7]	IECEx Type n	★
Custody Transfer		
Standard		**Standard**
C5[9]	Measurement Canada Accuracy Approval *(Limited availability depending on transmitter type and range. Contact an Emerson Process Management representative)*	★
Bolting Material		
Standard		**Standard**
L4	Austenitic 316 SST Bolts	★
L5	ASTM A 193, Grade B7M Bolts	★
L6	Alloy K-500 Bolts	★
Display Type		
Standard		**Standard**
M4[8]	LCD Display with Local Operator Interface	★
M5	LCD display for Aluminum Housing (Housing Codes A, B, C, and D only)	★
M6	LCD display for SST Housing (Housing Codes J, K, L, and M only)	★

Calibration Certificate		
Standard		**Standard**
Q4	Calibration Certificate	★
QG	Calibration Certificate and GOST Verification Certificate	★
QP	Calibration certification and tamper evident seal	★
Material Traceability Certification		
Standard		**Standard**
Q8	Material Traceability Certification per EN 10204 3.1 *(Only available for the sensor module housing and Coplanar or traditional flanges and adapters (3051C), and for the sensor module housing and low-volume Coplanar flange and adapter (3051C with Option Code S1))*	★
Quality Certification for Safety		
Standard		**Standard**
QS	Certificate of FMEDA Data	★
Zero/Span Adjustment		
Standard		**Standard**
J1[(9)(10)]	Local Zero Adjustment Only	★
J3[(9)(10)]	No Local Zero or Span Adjustment	★
Transient Protection Terminal Block		
Standard		**Standard**
T1	Transient Protection Terminal Block	★
Software Configuration		
Standard		**Standard**
C1[(9)]	Custom Software Configuration (Completed CDS 00806-0100-4001 required with order)	★
Low Power Output		
Expanded		
C2[(9)]	0.8–3.2 Vdc Output with Digital Signal Based on HART Protocol (Output Code M only)	
Gage Pressure Calibration		
Standard		**Standard**
C3	Gage Calibration (Model 3051CA4 only)	★
Alarm Limit		
Standard		**Standard**
C4[(9)(11)]	Analog Output Levels Compliant with NAMUR Recommendation NE 43, Alarm High	★
CN[(9)(11)]	Analog Output Levels Compliant with NAMUR Recommendation NE 43, Alarm Low	★

Pressure Testing		
Expanded		
P1	Hydrostatic Testing with Certificate	
Cleaning Process Area		
Expanded		
P2	Cleaning for Special Service	
P3	Cleaning for <1 PPM Chlorine/Fluorine	
Pressure Calibration		
Expanded		
P4	Calibrate at Line Pressure *(Specify Q48 on order for corresponding certificate)*	
High Accuracy		
Standard		**Standard**
P8	0.04% accuracy to 5:1 turndown (Range 2-4)	★
Flange Adapters		
Standard		**Standard**
DF	1/2 -14 NPT flange adapter(s)	★
D3	¼–18 NPT Process Connections (No flange adapters), Hastelloy	★
D3	¼–18 NPT Process Connections (No flange adapters), *Monel*	★
Vent/Drain Valves		
Expanded		
D7	Coplanar Flange Without Drain/Vent Ports	
Conduit Plug		
Standard		**Standard**
DO	316 SST Conduit Plug	★
RC1/4 RC1/2 Process Connection		
Expanded		
D9	JIS Process Connection—RC ¼ Flange with RC ½ Flange Adapter, CS	
D9	JIS Process Connection—RC ¼ Flange with RC ½ Flange Adapter, 316SST	
Max Static Line Pressure		
Standard		**Standard**
P9	4500 psig Static Pressure Limit (3051CD Ranges 2–5 only)	★

Ground Screw		
Standard		**Standard**
V5[12]	External Ground Screw Assembly	★
Drinking Water Approval		
Standard		**Standard**
DW	NSF drinking water approval	★
Surface Finish		
Standard		**Standard**
Q16	Surface finish certification for sanitary remote seals	★
Toolkit Total System Performance Reports		
Standard		**Standard**
QZ	Remote Seal System Performance Calculation Report	★
Conduit Electrical Connector		
Standard		**Standard**
GE	M12, 4-pin, Male Connector (eurofast®)	★
GM	A size Mini, 4-pin, Male Connector (minifast®)	★
Typical Model Number: 3051CD 2 A 2 2 A 1 A B4$13857 780		

(1) 3051CG lower range limit varies with atmospheric pressure.
(2) 3051CD0 is available only with Output Code A, Process Flange Code 0 (Alternate Flange H2, H7, HJ, or HK), Isolating Diaphragm Code 2, O-ring Code A, and Bolting Option L4.
(3) Option code M4 - LCD Display with Local Operator Interface required for local addressing and configuration.
(4) Not available with hazardous locations certification Options Codes I1, N1, E4, K6 and K8.
(5) Materials of Construction comply with recommendations per NACE MR0175/ISO 15156 for sour oil field production environments. Environmental limits apply to certain materials. Consult latest standard for details. Selected materials also conform to NACE MR0103 for sour refining environments.
(6) "Assemble-to" items are specified separately and require a completed model number.
(7) Not available with Low Power code M.
(8) Available only with output code W - Profibus PA.
(9) Not available with Fieldbus (output code F) or Profibus (output code W).
(10) Local zero and span adjustments are standard unless Option Code J1 or J3 is specified.
(11) NAMUR-Compliant operation is pre-set at the factory and cannot be changed to standard operation in the field.
(12) The V5 option is not needed with the T1 option; external ground screw assembly is included with the T1 option.

Typical Model Number: 3051L 2 A A0 D 21 A A F1				

(1) Option code M4 - LCD Display with Local Operator Interface required for local addressing and configuration.
(2) Not available with hazardous certification Option Codes I1, N1, E4, K6, and K8.
(3) Materials of Construction comply with metallurgical requirements highlighted within NACE MR0175/ISO 15156 for sour oil field production environments. Environmental limits apply to certain materials. Consult latest standard for details. Selected materials also conform to NACE MR0103 for sour refining environments.
(4) "Assemble-to" items are specified separately and require a completed model number.
(5) Not available with low-power Option Code M
(6) Available only with output code W - Profibus PA.
(7) Only available with HART 4-20 mA output (output code A).
(8) Not available with fieldbus (output code F) or profibus protocols (output code W).
(9) Local zero and span adjustments are standard unless Option Code J1 or J3 is specified.
(10) The T1 option is not needed with FISCO Product Certifications; transient protection is included in the FISCO product certification codes IA, IE, IF, and IG.
(11) NAMUR-Compliant operation is pre-set at the factory and cannot be changed to standard operation in the field.
(12) The V5 option is not needed with the T1 option; external ground screw assembly is included with the T1 option.

(1) Not available with hazardous certification Option Codes I1, N1, E4, K6, and K8.
(2) Materials of Construction comply with recommendations per NACE MR0175/ISO 15156 for sour oil field production environments. Environmental limits apply to certain materials. Consult latest standard for details. Selected materials also conform to NACE MR0103 for sour refining environments.
(3) "Assemble-to" items are specified separately and require a completed model number.
(4) Not available with Low Power code M.
(5) Not available with fieldbus (output code F) or profibus protocols (output code W).
(6) Local zero and span adjustments are standard unless Option Code J1 or J3 is specified.
(7) NAMUR-Compliant operation is pre-set at the factory and cannot be changed to standard operation in the field.
(8) The V5 option is not needed with the T1 option; external ground screw assembly is included with the T1 option.

A.6 Options

Standard Configuration

Unless otherwise specified, transmitter is shipped as follows:

Engineering units ***Differential/Gage*:** ***Absolute/3051T*:**	inH_2O (Range 0, 1, 2, and 3) psi (Range 4 and 5) psi (all ranges)
4 mA (1 Vdc)[(1)]:	0 (engineering units above)
20 mA (5 Vdc):	Upper range limit
Output:	Linear
Flange type:	Specified model code option
Flange material:	Specified model code option
O-ring material:	Specified model code option
Drain/vent:	Specified model code option
Integral meter:	Installed or none
Alarm[(1)]:	Upscale
Software tag:	(Blank)

(1) Not applicable to fieldbus.

Custom Configuration HART protocol only[(1)]

If Option Code C1 is ordered, the customer may specify the following data in addition to the standard configuration parameters.

- Output Information
- Transmitter Information
- LCD display Configuration
- Hardware Selectable Information
- Signal Selection

Refer to the “HART Protocol C1 Option Configuration Data Sheet” document number 00806-0100-4001.

(1)Not applicable to fieldbus.

Tagging (3 options available)

- Standard SST hardware tag is wired to the transmitter. Tag character height is 0.125 in. (3,18 mm), 56 characters maximum.
- Tag may be permanently stamped on transmitter nameplate upon request, 56 characters maximum.
- Tag may be stored in transmitter memory (30 characters maximum). Software tag is left blank unless specified.

Commissioning tag (fieldbus only)

A temporary commissioning tag is attached to all transmitters. The tag indicates the device ID and allows an area for writing the location.

Optional Rosemount 304, 305, or 306 Integral Manifolds

Factory assembled to 3051C and 3051T transmitters. Refer to the following Product Data Sheet (document number 00813-0100-4839 for Rosemount 304 and 00813-0100-4733 for Rosemount 305 and 306) for additional information.

Optional Diaphragm and Sanitary Seals

Refer to Product Data Sheet 00813-0100-4016 or 00813-0201-4016 for additional information.

Output Information(1)

Output range points must be the same unit of measure. Available units of measure include:

inH2O	inH2O@4 °C(1)	psi	Pa
inHg	ftH2O	bar	kPa
mmH2O	mmH2O@4 °C(1)	mbar	torr
mmHg	g/cm2	kg/cm2	atm

(1) Not available on low power or previous versions.

LCD display

M5 Digital Display, 5-Digit, 2-Line LCD

- Direct reading of digital data for higher accuracy
- Displays user-defined flow, level, volume, or pressure units
- Displays diagnostic messages for local troubleshooting
- 90-degree rotation capability for easy viewing

M6 Digital Display with 316 Stainless Steel Cover

- For use with stainless steel housing option (housing codes J, K, and L)

Local Span and Zero Adjustment[(1)]

Transmitters ship with local span and zero adjustments standard unless otherwise specified.

- Non-interactive external zero and span adjustments ease calibration
- Magnetic switches replace standard potentiometer adjustments to optimize performance

J1 Local Zero Adjustment Only[(1)]

J3 No Local Zero or Span Adjustment[(1)]

Bolts for Flanges and Adapters

- Options permit bolts for flanges and adapters to be obtained in various materials
- Standard material is plated carbon steel per ASTM A449, Type 1

L4 Austenitic 316 Stainless Steel Bolts

L5 ASTM A 193, Grade B7M Bolts

L6 Alloy K-500 Bolts

Rosemount 3051C Coplanar Flange and 3051T Bracket Option

B4 Bracket for 2-in. Pipe or Panel Mounting

- For use with the standard Coplanar flange configuration
- Bracket for mounting of transmitter on 2-in. pipe or panel
- Stainless steel construction with stainless steel bolts

Rosemount 3051H Bracket Options

B5 Bracket for 2-in. Pipe or Panel Mounting

- For use with the 3051H Pressure Transmitter for high process temperatures
- Carbon steel construction with carbon steel bolts

B6 B5 Bracket with SST Bolts

- Same bracket as the B5 option with Series 300 stainless steel bolts.

Traditional Flange Bracket Options

B1 Bracket for 2-in. Pipe Mounting

- For use with the traditional flange option
- Bracket for mounting on 2-in. pipe
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

(1)Not applicable to fieldbus.

B2 Bracket for Panel Mounting

- For use with the traditional flange option
- Bracket for mounting transmitter on wall or panel
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

B3 Flat Bracket for 2-in. Pipe Mounting

- For use with the traditional flange option
- Bracket for vertical mounting of transmitter on 2-in. pipe
- Carbon steel construction with carbon steel bolts
- Coated with polyurethane paint

B7 B1 Bracket with SST Bolts

- Same bracket as the B1 option with Series 300 stainless steel bolts

B8 B2 Bracket with SST Bolts

- Same bracket as the B2 option with Series 300 stainless steel bolts

B9 B3 Bracket with SST Bolts

- Same bracket as the B3 option with Series 300 stainless steel bolts

BA Stainless Steel B1 Bracket with SST Bolts

- B1 bracket in stainless steel with Series 300 stainless steel bolts

BC Stainless Steel B3 Bracket with SST Bolts

- B3 bracket in stainless steel with Series 300 stainless steel bolts

Shipping weights

Table A-6. Transmitter weights without options

Transmitter	Add weight In lb (kg)
3051C	6.0 (2,7)

3 in., class 300, SST	03031-0393-0232
DIN, DN 50, PN 40	03031-0393-1002
DIN, DN 80, PN 40	03031-0393-1012
Flange adapter kits (each kit contains parts for one DP transmitter or two GP/AP transmitters)	**Part number**
CS bolts, glass-filled PTFE O-Rings	
SST adapters	03031-1300-0002
Cast Alloy C-276 adapters	03031-1300-0003
Alloy 400 adapters	03031-1300-0004
Nickel-plated carbon steel adapters	03031-1300-0005
SST bolts, glass-filled PTFE O-Rings	
SST adapters	03031-1300-0012
Cast Alloy C-276 adapters	03031-1300-0013
Alloy 400 adapters	03031-1300-0014
Nickel-plated carbon steel adapters	03031-1300-0015
CS bolts, graphite-filled PTFE O-Rings	
SST adapters	03031-1300-0102
Cast Alloy C-276 adapters	03031-1300-0103
Alloy 400 adapters	03031-1300-0104
Nickel-plated carbon steel adapters	03031-1300-0105
SST bolts, graphite-filled PTFE O-Rings	
SST adapters	03031-1300-0112
Cast Alloy C-276 adapters	03031-1300-0113

Alloy 400 adapters	03031-1300-0114
Nickel-plated carbon steel adapters	03031-1300-0115
Flange adapters	**Part number**
1/2 - 14 NPT Adapters	
316 SST	02024-0069-0002
Cast C-276	02024-0069-0003
Cast Alloy 400	02024-0069-0004
Nickel-plated carbon steel	02024-0069-0005
Socket Weld Adapters	
316 SST	02024-0069-1002
Cast C-276	02024-0069-1003
Cast Alloy 400	02024-0069-1004
O-Ring packages (package of 12)	**Part number**
Electronics housing, cover	03031-0232-0001
Electronics housing, module	03031-0233-0001
Process flange, glass-filled PTFE (White)	03031-0234-0001
Process flange, graphite-filled PTFE (Black)	03031-0234-0002
Process flange for 3051H, PTFE (White)	02051-0167-0001
Flange adapter, glass-filled PTFE (Light Brown)	03031-0242-0001
Flange adapter, graphite-filled PTFE (Black)	03031-0242-0002
Bolt kits	**Part number**
COPLANAR FLANGE	
Flange Bolt Kit {44mm (1.75 in.)} (set of 4)	
Carbon steel	03031-0312-0001
316 SST	03031-0312-0002
ASTM A 193, Grade B7M	03031-0312-0003
Alloy K-500	03031-0312-0004
Flange/Adapter Bolt Kit {73mm (2.88 in.)} (set of 4)	
Carbon steel	03031-0306-0001
316 SST	03031-0306-0002
ASTM A 193, Grade B7M	03031-0306-0003
Alloy K-500	03031-0306-0004

TRADITIONAL FLANGE	
Differential Flange/Adapter Bolt Kit {44mm (1.75 in.)} (set of 8)	
Carbon steel	03031-0307-0001
316 SST	03031-0307-0002
ASTM A 193, Grade B7M	03031-0307-0003
Alloy K-500	03031-0307-0004
Gage/Absolute Flange/Adapter Bolt Kit {44mm (1.75 in.)} (set of 6)	
Carbon steel	03031-0307-1001
316 SST	03031-0307-1002
ASTM A 193, Grade B7M	03031-0307-1003
Alloy K-500	03031-0307-1004
Conventional Manifold/Traditional Flange Bolts	
Carbon steel	Use bolts supplied with manifold
316 SST	Use bolts supplied with manifold
Level Flange, Vertical Mount Bolt Kit (Set of 4)	
Carbon steel	03031-0395-0001
316 SST	03031-0395-0002
3051H Process Flange Bolt Kit (Set of 4)	
Carbon Steel	02051-0164-0001
316 SST	02051-0164-0002
Drain/Vent valve kits (each kit contains parts for one transmitter)	**Part number**
Differential Drain/Vent Kits	
316 SST stem and seat kit	01151-0028-0022
Alloy C-276 stem and seat kit	01151-0028-0023
Alloy K-500 stem and Alloy 400 seat kit	01151-0028-0024
316 SST ceramic ball drain/vent kit	03031-0378-0022
Alloy C-276 ceramic ball drain/vent kit	03031-0378-0023
Alloy 400/K-500 ceramic ball drain/vent kit	03031-0378-0024
Gage/Absolute Drain/Vent Kits	
316 SST stem and seat kit	01151-0028-0012
Alloy C-276 stem and seat kit	01151-0028-0013
Alloy K-500 stem and Alloy 400 seat kit	01151-0028-0014
316 SST ceramic ball drain/vent kit	03031-0378-0012
Alloy C-276 ceramic ball drain/vent kit	03031-0378-0013
Alloy 400/K-500 ceramic ball drain/vent kit	03031-0378-0014

Mounting brackets	Part number
3051C and 3051L Coplanar Flange Bracket kit	
B4 bracket, SST, 2-in. pipe mount, SST bolts	03031-0189-0003
3051T Inline Bracket Kit	
B4 bracket, SST, 2-in. pipe mount, SST bolts	03031-0189-0004
3051C Traditional Flange Bracket Kits	
B1 bracket, 2-in. pipe mount, CS bolts	03031-0313-0001
B2 bracket, panel mount, CS bolts	03031-0313-0002
B3 flat bracket, 2-in. pipe mount, CS bolts	03031-0313-0003
B7 (B1 bracket, SST bolts)	03031-0313-0007
B8 (B2 bracket, SST bolts)	03031-0313-0008
B9 (B3 bracket, SST bolts)	03031-0313-0009
BA (SST B1 bracket, SST bolts)	03031-0313-0011
BC (SST B3 bracket, SST bolts)	03031-0313-0013
3051H Bracket Kits	
B5 universal bracket, 2-in. pipe and panel mount, CS bolts	03051-1081-0001
B6 universal bracket, 2-in. pipe and panel mount, SST bolts	03051-1081-0002
FOUNDATION fieldbus upgrade kit	**Part number**
Aluminum Housing	03031-0198-0001
316 SST Housing	03031-0198-0002

Overview . . . . . page 175
Safety messages . . . . . page 175
Approved manufacturing locations . . . . . page 176
European directive information . . . . . page 176
Hazardous locations certifications . . . . . page 177
Approval drawings . . . . . page 184

B.1 Overview

This Appendix contains information on Approved manufacturing locations, European directive information, Ordinary Location certification, Hazardous Locations Certifications and approval drawings for HART protocol.

B.2 Safety messages

Procedures and instructions in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that raises potential safety issues is indicated by a warning symbol (⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

B.2.1 Warnings

⚠ WARNING

Explosions could result in death or serious injury:

Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review this section of the Model 3051 reference manual for any restrictions associated with a safe installation.

- Before connecting a HART-based communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
- In an Explosion-Proof/Flameproof installation, do not remove the transmitter covers when power is applied to the unit.

Process leaks may cause harm or result in death.

- Install and tighten process connectors before applying pressure.

Electrical shock can result in death or serious injury.

- Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

⚠ WARNING

Cable gland and plug must comply with the requirements listed on the certificates.

B.3 Approved manufacturing locations

Emerson Process Management - Rosemount Inc. — Chanhassen, Minnesota, USA
Emerson Process Management — Wessling, Germany
Emerson Process Management Asia Pacific Private Limited — Singapore
Emerson Process Management — Beijing, China
Emerson Process Management — Daman, India

B.4 European directive information

The most recent revision of the EC declaration of conformity can be found at www.emersonprocess.com.

B.4.1 Ordinary location certification for factory mutual

As standard, the transmitter has been examined and tested to determine that the design meets basic electrical, mechanical, and fire protection requirements by FM, a nationally recognized testing laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

B.5 Hazardous locations certifications

B.5.1 North american certifications

FM Approvals

E5 Explosion-Proof and Dust Ignition Proof
Certificate No: 0T2H0.AE
Applicable Standards: FM Class 3600 – 1998, FM Class 3615 – 2006, FM Class 3810 – 2005, ANSI/NEMA 250 - 2003

Markings: Explosion-Proof for Class I, Division 1, Groups B, C, and D.

Dust-Ignition-Proof for Class II, Division 1, Groups E, F, G; and Class III, Division 1.
T5 (Ta = -50 °C to +85 °C), Factory Sealed, Enclosure Type 4x

I5 Intrinsically Safe and Non-Incendive
Certificate No: 1Q4A4.AX
Applicable Standards: FM Class 3600 – 1998, FM Class 3610 – 2010, FM Class 3611 – 2004, FM Class 3810 – 2005
Markings: Intrinsically Safe for use in Class I, Division 1, Groups A, B, C, and D; Class II, Division 1, Groups E, F, and G; Class III, Division 1 when connected per Rosemount drawing 03031-1019 and 00375-1130 (When used with a Field Communicator); Non-incendive for Class I, Division 2, Groups A, B, C, and D.
Temperature Code: T4 (Ta = -50 °C to +40 °C), T3 (Ta = -50 °C to +85 °C), Enclosure Type 4x.

Special Conditions for Safe Use:

1.) The Rosemount 3051 transmitter housing contains aluminum and is considered a potential risk of ignition by impact or friction. Care must be taken into account during installation and use to prevent impact and friction.

2.) The Rosemount 3051 transmitter with the transient terminal block (Option code T1) will not pass the 500Vrms dielectric strength test and this must be taken into account during installation.

CSA international

All CSA hazardous location approved transmitters are certified to ANSI/ISA 12.27.01-2003.

E6 Explosion-Proof, Dust Ignition Proof and Class I Division 2
Certificate No.: 1053834
Applicable Standards: CSA Std. C22.2 No. 142 – M1987, CSA Std. C22.2 No. 30 – M1986, CSA Std. C22.2 No. 213 – M1987, ANSI/ISA 12.27.01-2003.
Markings: Explosion-Proof for Class I, Division 1, Groups B, C, and D.
Dust-Ignition-Proof for Class II and Class III, Division 1, Groups E, F, and G.
Suitable for Class I, Division 2 Groups A, B, C, and D. Enclosure type 4X, factory sealed. Single Seal (See Drawing 03031-1053).

I6 Intrinsically Safe
Certificate No.: 1053834
Applicable Standards: CSA Std. C22.2 No. 142 – M1987, CSA Std. C22.2 No. 157 – 92, ANSI/ISA 12.27.01-2003.
Markings: Intrinsically safe for Class I, Division 1, Groups A, B, C, and D when connected in accordance with Rosemount drawings 03031-1024. Temperature Code T3C. Enclosure Type 4X, Single Seal. Single Seal (See Drawing 03031-1053).

European certifications

E8 ATEX Flame-Proof
Certification No.: KEMA 00ATEX2013X
Applicable Standards: EN60079-0: 2009, EN60079-1: 2007, EN60079-26: 2007, IEC 60079-0:2011
Markings: ⟨Ex⟩ II 1/2 G, Ex d IIC T6 (–50 ≤ Ta ≤ 65 °C) Ga/Gb,
Ex d IIC T5 (–50 ≤ Ta ≤ 80 °C) Ga/Gb,
CE 1180

Process Temp	Ambient Temp	Temp Class
-50 to 65	-50 to 65	T6
-50 to 80	-50 to 80	T5

Special Conditions for Safe Use (X):

1.) In case of repair, contact the manufacturer for information on the dimensions of the flameproof joints.

2.) This device contains a thin wall diaphragm. Installation, maintenance and use shall take into account the environmental conditions to which the diaphragm will be subjected. The manufacturer's instructions for installation and maintenance shall be followed in detail to assure safety during its expected lifetime.

3.) The capacitance of the wrap around label to the enclosure, 1.6E-9 F, exceeds the limit in Table 9 of IEC 60079-0. The user shall determine suitability for the specific application.

4.) Wait at least 5 minutes after powering down device before opening covers, when a hazardous atmosphere is present.

I1 ATEX Intrinsic Safety and Dust
Certificate No.: BAS 97ATEX1089X
Applicable Standards: IEC60079-0:2011, EN60079-11: 2012, EN60079-31: 2009,
Markings: ⟨Ex⟩ II 1 GD, Ex ia IIC T4 Ga (–60 ≤ Ta ≤ +70 °C),
Ex ia IIC T5 Ga (–60 ≤ Ta ≤ +40 °C)
Ex ta IIIC T50 °C T_{500} 60°C Da, Ui = 30 V Ii = 200 mA Pi = 0.9 W Ci = 0.012 µF, IP66,
CE 1180

Special Conditions for Safe Use (X):

1.) The apparatus is not capable of withstanding the 500 V insulation test required by EN60079-11. This must be taken into account when installing the apparatus.

2.) The enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however care should be taken to protect it from impact or abrasion if located in Zone 0.

N1 ATEX Non-incendive/Type n and Dust
Certification No.: BAS 00ATEX3105X
Applicable Standards: IEC60079-0:2011, EN60079-15:2010, EN60079-31:2009
Markings: ⟨Ex⟩II 3 GD, Ex nA IIC Gc T5 (–40 ≤ Ta ≤ 70 °C),
Ex ta IIIC T50 °C T_{500} 60°C Da, IP66
CE 1180

Specific Conditions for Safe Use (X):

1.) The apparatus is not capable of withstanding the 500 V insulation test required by EN60079-15. This must be taken into account when installing the apparatus.

2.) This device contains a thin wall diaphragm. Installation, maintenance, and use shall take into account the environmental conditions to which the diaphragm will be subjected. The manufacturer's instructions for installation and maintenance shall be followed in detail to assure safety during its expected lifetime. In case of repair, contact the manufacturer for more information on the dimensions of the flameproof joints.

Markings: Ex d IIC T6

I4 TIIS Intrinsic Safety
Certification No.: TC16406
Markings: Ex ia IIC T4

IECEx certifications

E7 IECEx Flame-proof
Certification No.: IECEx KEM 09.0034X
Applicable Standards: IEC60079-0:2011, IEC60079-1:2007-04, IEC60079-26:2006,
Markings: Ex d IIC T5...T6 Ga/Gb, T5 (-50 °C ≤ Ta ≤ 80 °C)/T6 (-50 °C ≤ Ta ≤ 65 °C)

Process Temp	Ambient Temp	Temp Class
-50 to 65	-50 to 65	T6
-50 to 80	-50 to 80	T5

Conditions of Certification (X):

1.) This device contains a thin wall diaphragm. Installation, maintenance, and use shall take into account the environmental conditions to which the diaphragm will be subjected. The manufacturer's instructions for installation and maintenance shall be followed in detail to assure safety during its expected lifetime.

2.) For information on the dimensions of the flameproof joints the manufacturer shall be contacted.

3.) The capacitance of the wrap around label to the enclosure, 1.6E-9 F, exceeds the limit in Table 9 of IEC 60079-0. The user shall determine suitability for the specific application.

4.) Wait at least 5 minutes after powering down device before opening covers, when a hazardous atmosphere is present.

I7 IECEx Intrinsic Safety
Certification No.: IECEx BAS 09.0076X
Applicable Standards: IEC60079-0:2011, IEC 60079-11:2006
Markings: Ex ia IIC T5 Ga (-60°C ≤ Ta ≤ 40°C), Ex ia IIC T4 Ga (-60°C ≤ Ta ≤ 70°C)
Ui = 30V, Ii = 200mA, Pi = 0.9W, Ci = 0.012 μF, Li = 0

Conditions of Certification (X):

1.) If the apparatus is fitted with an optional 90V transient suppressor, it is not capable of withstanding the 500V insulation test required by IEC 60079-11. This must be taken into account when installing the apparatus.

2.) The enclosure may be made of aluminum alloy and given a protective polyurethane paint finish; however, care should be taken to protect it from impact or abrasion if located in Zone 0.

N7 IECEx Type 'n'
Certification No.: IECEx BAS 09.0077X
Applicable Standards: IEC60079-0:2011, IEC60079-15:2010
Markings: Ex nA IIC T5 Gc (-40 ≤ Ta ≤ 70 °C)

Conditions of Certification (X):

The apparatus is not capable of withstanding the 500V insulation test required by IEC 60079-15. This must be taken into account when installing the apparatus.

China certifications

E3 Flameproof and Dust
NEPSI Certificate No.: GYJ091065X
Applicable Standards: GB3836.1-2000, GB3836.4-2000,GB4208-1993, GB12476-2000
Markings: Ex d II C T5/T6, -50°~+80°C (T5), -50°~+65°C (T6), DIP A21 TA T90°C, IP66

Specific Conditions for Safe Use (X):

The symbol "X" placed after the certificate number indicates special condition for safe use, that is the transmitter contains a thin wall diaphragm. Installation, maintenance, and use shall not only take into account the environmental condition, but also follow the manufacturer's instructions.

2.1 The relation between ambient temperature range and temperature class is as follows:

T_a	Temperature class
-50 °C to 80 °C	T5
-50 °C to 65 °C	T6

When used in combustible dust environment, the maximum ambient temperature is 80 °C.

2.2 The earth connection facility in the enclosure should be connected reliably.

2.3 Cable entry certified by notified body with type of protection Ex d II C in accordance with GB3836.1-2000 and GB3836.2-2000, should be applied when installing in hazardous location. When used in combustible dust environment, cable entry in accordance with IP66 or higher level should be applied.

2.4 Obey the warning "Keep tight when the circuit is alive."

2.5 End users are not permitted to change any component's insides.

2.6 When installing, using, and maintaining the transmitter, observe the following standards
GB3836.13-1997 "Electrical apparatus for explosive gas atmospheres Part 13: Repair and overhaul for apparatus used in explosive gas atmospheres"
GB3836.15-2000 "Electrical apparatus for explosive gas atmospheres Part 15: Electrical installations in hazardous area (other than mines)"
GB3836.16-2006 "Electrical apparatus for explosive gas atmospheres Part 16: Inspection and maintenance of electrical installation (other than mines)"
GB50257-1996 "Code for construction and acceptance of electric device for explosion atmospheres and fire hazard electrical equipment installation engineering"
GB12476.2-2006 "Electrical apparatus for use in the presence of combustible dust Part 1-2: Electrical apparatus protected by enclosures and surface temperature limitation-Selection, installation and maintenance"
GB15577-2007 "Safety regulations for dust explosion prevention and protection"

I3 Intrinsic Safety and Dust
NEPSI Certificate No: GYJ091066X
Applicable Standards: GB3836.1-2000, GB3836.2-2000,GB4208-1993, GB12476-2000
Markings: Ex ia II C T4/T5, -60°~+40°C (T5), -60°~+70°C (T4), DIP A21 TA T80°C

Specific Conditions for Safe Use (X):

1. The relation between ambient temperature range and temperature class is as following:

T_a	Temperature Class
-60 °C +40 °C	T5
-60 °C +70 °C	T4

When used in combustible dust environment, the maximum ambient temperature is -20 °C+40 °C.

2. The earth connection facility in the enclosure should be connected reliably.

3. The maximum internal parameters of the transmitter are as following:
U_i = 30 V, I_i=200 mA, P_i=0.9 W, L_i=0 mH, C_i=0.012 μ F

4. End users is not permitted to change any components insides.

5. When installing, using, and maintaining transmitter, observe following standards:
GB3836.1 1997 “Electrical apparatus for explosive gas atmospheres Part 13: Repair and overhaul for apparatus used in explosive gas atmospheres”
GB3836.15-2000 “Electrical apparatus for explosive gas atmospheres Part 15: Electrical installations in hazardous area (other than mines)”
GB3836.16-2006 “Electrical appartus for explosive gas atmospheres Part 16: Inspection and maintenance of electrical installation (other than mines)”
GB50257-1996 “Code for construction and acceptance of electric device for explosion atmospheres and fire hazard eletrical equipment installation engineering”
GB12476.2-2006 “"Electrical apparatus for use in the presence of combustible dust Part 1-2: Electrical apparatus protected by enclosures and surface temperature limitation-Selection, installation and maintenance"
GB15577-2007 “Safety regulations for dust explosion prevention and protection”

U_i = 30 V
I_i = 200 mA
P_i = 1 W
C_i = 0.012 μF
L_i = 0

N3 China Type n - Non-Sparking
NEPSI Certificate No.: GYJ101111X
Applicable Standards: GB3836.1-2000, GB3836.8-2003
Markings: Ex nA nL IIC T5 (-40 °C < TA < 70 °C)

Specific Conditions for Safe Use (X):

1. Symbol "X" is used to denote specific conditions of use: The apparatus is not capable of withstanding the 500 V test to earth for one minute. This must be taken into consideration during installation.

2. The ambient temperature range is: -40 °C $\leq T_a \leq$ +70 °C

3. Maximum input voltage: 42.4 V.

4. Cable glands, conduit or blanking plugs, certified by NEPSI with Ex e or Ex n protection type and IP66 degree of protection provided by enclosure, should be used on external connections and redundant cable entries.

5. Maintenance should be done in non-hazardous location.

6. End users are not permitted to change any components insides, but to settle the problem in conjunction with manufacturer to avoid damage to the product.

7. When installing, using, and maintaining transmitter, observe following standards:
GB3836.1 1997 “Electrical apparatus for explosive gas atmospheres Part 13: Repair and overhaul for apparatus used in explosive gas atmospheres”
GB3836.15-2000 “Electrical apparatus for explosive gas atmospheres Part 15: Electrical installations in hazardous area (other than mines)”
GB3836.16-2006 “Electrical appartus for explosive gas atmospheres Part 16: Inspection and maintenance of electrical installation (other than mines)”
GB50257-1996 “Code for construction and acceptance of electric device for explosion atmospheres and fire hazard eletrical equipment installation engineering”

Combinations of certifications

Stainless steel certification tag is provided when optional approval is specified. Once a device labeled with multiple approval types is installed, it should not be reinstalled using any other approval types. Permanently mark the approval label to distinguish it from unused approval types.

ENTITY CONCEPT APPROVALS

THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS TO ASSOCIATED APPARATUS NOT SPECIFICALLY EXAMINED IN COMBINATION AS A SYSTEM. THE APPROVED VALUES OF MAX. OPEN CIRCUIT VOLTAGE (Voc OR Vt) AND MAX. SHORT CIRCUIT CURRENT (Isc OR It) AND MAX.POWER (Voc X Isc/4) OR (Vt X It/4), FOR THE ASSOCIATED APPARATUS MUST BE LESS THAN OR EQUAL TO THE MAXIMUM SAFE INPUT VOLTAGE (Vmax), MAXIMUM SAFE INPUT CURRENT (Imax), AND MAXIMUM SAFE INPUT POWER (Pmax) OF THE INTRINSICALLY SAFE APPARATUS. IN ADDITION, THE APPROVED MAX. ALLOWABLE CONNECTED CAPACITANCE (Ca) OF THE ASSOCIATED APPARATUS MUST BE GREATER THAN THE SUM OF THE INTERCONNECTING CABLE CAPACITANCE AND THE UNPROTECTED INTERNAL CAPACITANCE (C_i) OF THE INTRINSICALLY SAFE APPARATUS, AND THE APPROVED MAX. ALLOWABLE CONNECTED INDUCTANCE (La) OF THE ASSOCIATED APPARATUS MUST BE GREATER THAN THE SUM OF THE INTERCONNECTING CABLE INDUCTANCE AND THE UNPROTECTED INTERNAL INDUCTANCE (L_i) OF THE INTRINSICALLY SAFE APPARATUS.

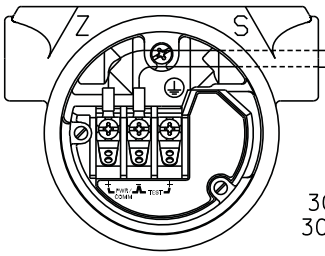
FOR OUTPUT CODE A

NOTE: ENTITY PARAMETERS LISTED APPLY ONLY TO ASSOCIATED APPARATUS WITH LINEAR OUTPUT.

CLASS I, DIV. 1, GROUPS A AND B

V_{MAX} = 40V	V_T OR V_{OC} IS LESS THAN OR EQUAL TO 40V
I_{MAX} = 165mA	I_T OR I_{SC} IS LESS THAN OR EQUAL TO 165mA
P_{MAX} = 1 WATT	$(\frac{V_T \times I_T}{4})$ OR $(\frac{V_{OC} \times I_{SC}}{4})$ IS LESS THAN OR EQUAL TO 1 WATT
C_I = .01μf	C_A IS GREATER THAN .01μf
L_I =10μH	L_A IS GREATER THAN 10μH

✳ FOR T1 OPTION:



Imax = 160mA	I_T OR I_{SC} IS LESS THAN OR EQUAL TO 160mA
L_I =1.05mH	L_A IS GREATER THAN 1.05mH

CLASS I, DIV. 1, GROUPS C AND D

V_{MAX} = 40V	V_T OR V_{OC} IS LESS THAN OR EQUAL TO 40V
I_{MAX} = 225mA	I_T OR I_{SC} IS LESS THAN OR EQUAL TO 225mA
P_{MAX} = 1 WATT	$(\frac{V_T \times I_T}{4})$ OR $(\frac{V_{OC} \times I_{SC}}{4})$ IS LESS THAN OR EQUAL TO 1 WATT
C_I = .01μf	C_A IS GREATER THAN .01μf

FISCO CONCEPT APPROVALS

THE FISCO CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALY SAFE APPARATUS TO ASSOCIATED APPARATUS NOT SPECIALLY EXAMINED IN SUCH COMBINATION. FOR THIS INTERCONNECTION TO BE VALID THE VOLTAGE (U_i or Vmax), THE CURRENT (I_i or Imax), AND THE POWER (P_i or Pma) THAT INTRINSICALLY SAVE APPARATUS CAN RECEIVE AND REMAIN INTRINSICALY SAFE, INCLUDING FAULTS, MUST BE EQUAL OR GREATER THAN THE VOLTAGE (Uo, Voc, or Vt), THE CURRENT (Io, Isc, or It), AND THE POWER (Po or Pmax) LEVELS WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS, CONSIDERING FAULTS AND APPLICABLE FACTORS. ALSO, THE MAXIMUM UNPROTECTED CAPACITANCE (C_i) AND THE INDUCTANCE (L_i) OF EACH APPARATUS (BESIDES THE TERMINATION) CONNECTED TO THE FIELDBUS MUST BE LESS THAN OR EQUAL TO 5nF AND 10μH RESPECTVELY.
ONLY ONE ACTIVE DEVICE IN EACH SECTION (USUALLY THE ASSOCIATED APPARATUS) IS ALLOWED TO CONTRIBUTE THE DESIRED ENERGY FOR THE FIELDBUS SYSTEM. THE ASSOCIATED APPARATUS' VOLTAGE Uo (or Voc or Vt) IS LIMITED TO A RANGE OF 14V TO 24 V.D.C. ALL OTHER EQUIPENT COMBINED IN THE BUS CABLE MUST BE PASSIVE (THEY CANNOT PROVIDE ENERGY TO THE SYSTEM, EXCEPT A LEAKAGE CURRENT OF 50 μA FOR EACH CONNECTED DEVICE) SEPARATELY POWERED EQUIPMENT REQUIRES A GALVANIC ISOLATION TO AFFIRM THAT THE INTRINSICALLY SAFE FIELDBUS CIRCUIT WILL REMAIN PASSIVE. THE PARAMETER OF THE CABLE USED TO INTERCONNECT THE DEVICES MUST BE IN THE FOLLOWING RANGE:

LOOP RESISTANCE R':	15...150 OHM/km
INDUCTANCE PER UNIT LENGTH L':	0.4...1mH/KM
CAPACITANCE PER UNLIT LENGTH C':	80...200nF

C' = C' LINE/LINE +0.5C' LINE/SCREEN, IF BOTH LINES ARE FLOATING, OR
C' = C' LINE/LINE +C' LINE/SCREEN, IF THE SCREEN IS CONNECTED TO ONE LINE

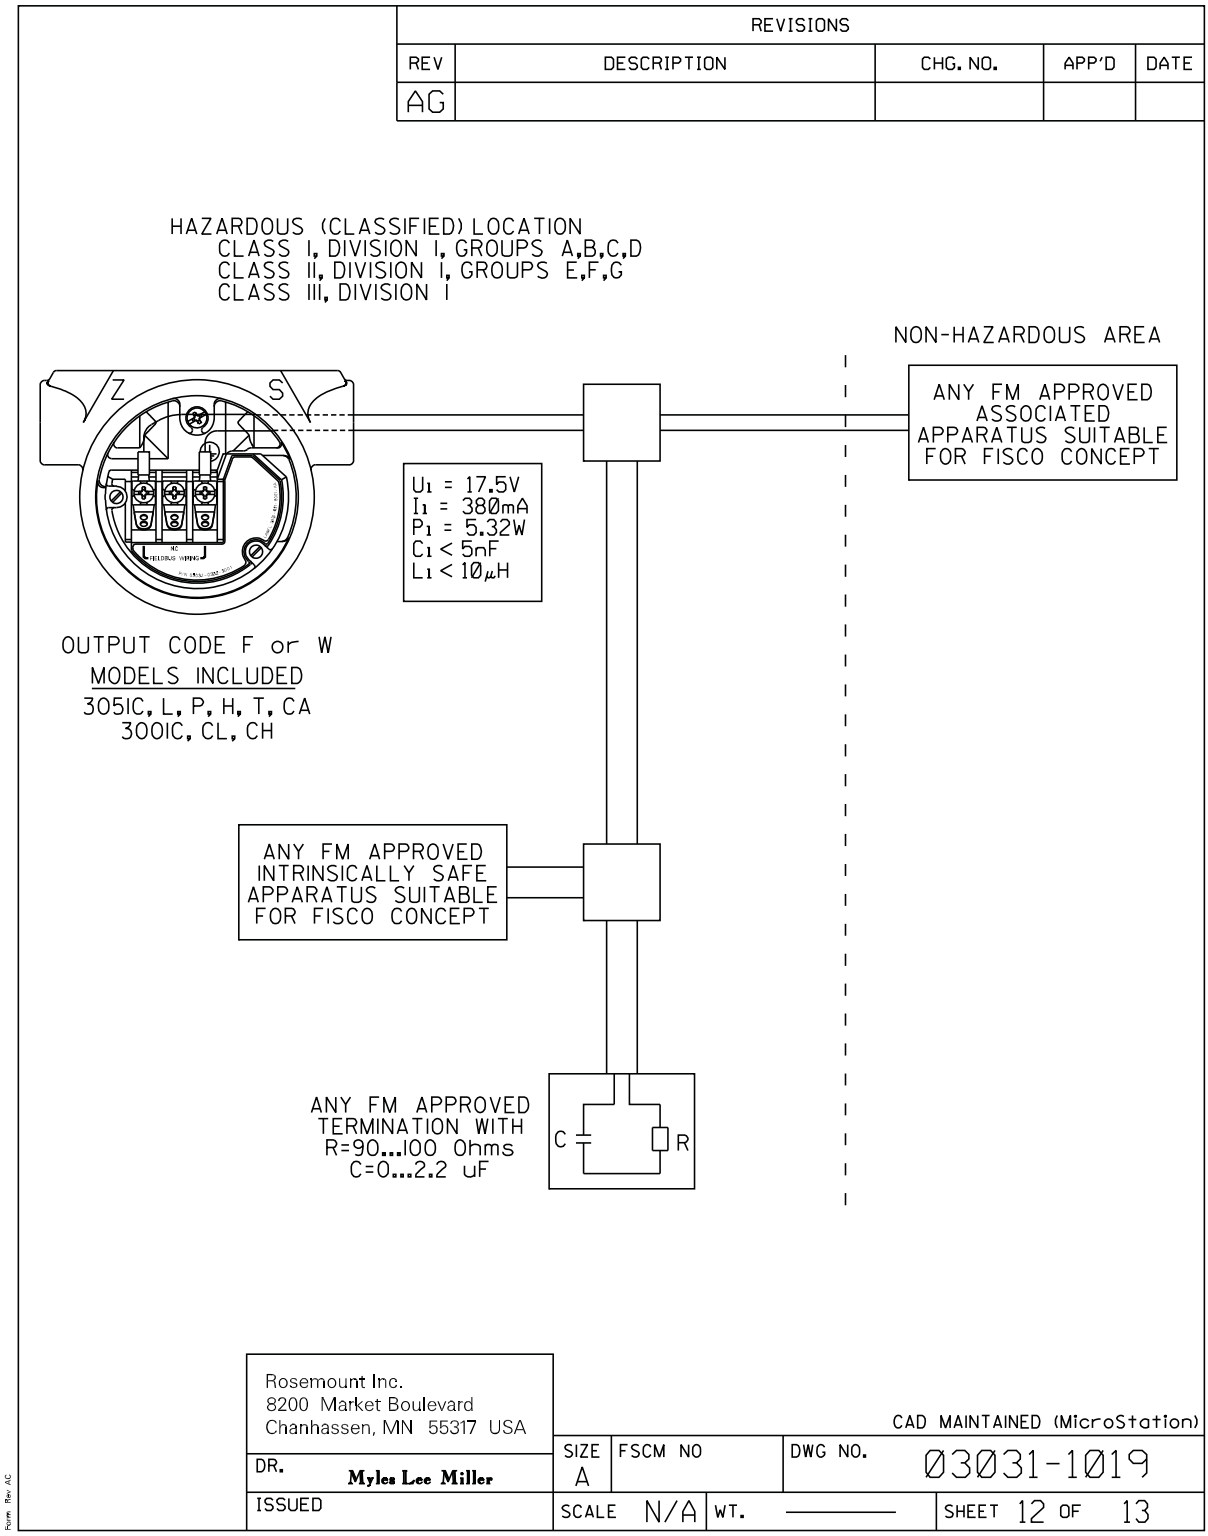
TRUNK CABLE LENGTH:	$\leq$ 1000 m
SPUR CABLE LENGTH:	$\leq$ 30 m
SPLICE LENGTH:	$\leq$ 1 m

AN APPROVED INFALLIBLE LINE TERMINATION TO EACH END OF THE TRUNK CABLE, WITH THE FOLLOWING PARAMETERS IS APPROPRIATE:

R = 90...100 OHMS C = 2.2μF

AN ALLOWED TERMINATION MIGHT ALREADY BE LINKED IN THE ASSOCIATED APPARATUS. DUE TO I.S. REASONS, THE NUMBER OF PASSIVE APPARATUS CONNECTED TO THE BUS SEGMENT IS NOT LIMITED. IF THE RULES ABOVE ARE FOLLOWED, UP TO A TOTAL LENGTH OF 1000 m (THE SUMMATION OF TRUNK AND ALL SPUR CABLES), THE INDUCTANCE AND THE CAPACITANCE OF THE CABLE WILL NOT DAMAGE THE INTRINSIC SAFETY OF THE SYSTEM.

NOTES:
INTRINSICALLY SAFE CLASS I, DIV. 1, GROUPS A, B, C, D



1. THE MAXIMUM NON-HAZARDOUS AREA VOLTAGE MUST NOT EXCEED 250 V.
2. CAUTION: ONLY USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING TEMPERATURE.
3. WARNING: REPLACEMENT OF COMPONENTS MAY DAMAGE INTRINSIC SAFETY.

NONINCENDIVE FIELD CIRCUIT
CLASS I, DIV. 2 LOCATIONS

IN NORMAL OPERATION

DEVICES CONTROL THROUGH-CURRENT

PARAMETERS DEVICE

Voc <= Minimum of ($Vmax_1$, $Vmax_2$, ... $Vmax_N$)

$Imax_1$ >= Iq_1 + $Isignal_1$

$Imax_2$ >= Iq_1 + $Isignal_2$

.

.

.

$Imax_N$ >= Iq_N + $Isignal_N$

Ca <= Ci_1 + Ci_2 +... + Ci_N + Ccable

La <= Li_1 + Li_2 +... + Li_N + Lcable

Imax for an individual device = Iq + Isignal

Iq =Quiescent current through device (Maximum quiescent current for the device)

Isignal =Signaling current through device (Protocol may limit signaling to one device at a time)

Operating Imax = Iq_1 + Iq_2 +...+ Iq_N + I_{signal} max

I_{signal} max = Max. of ($Isignal_1$, $Isignal_2$ ..... $Isignal_N$)

ROSEMOUNT 3051/3001

	4-20mA / HART	FIELDBUS (F or W)
Vmax	40v	30v
Maximum normal operating current	22mA	27mA
Ca	.010uF	0uF
La	10uH	0uH

ROSEMOUNT 3051 TRANSMITTERS ARE CURRENT CONTROLLERS ON INDIVIDUAL PARALLEL BRANCHES WITH RESPECT TO THE POWER SUPPLY. IN NONINCENDIVE INSTALLATIONS THE Imax FOR EACH TRANSMITTER IS NOT RELATED TO THE MAXIMUM CURRENT OF THE POWER SUPPLY (Isc) IN THE SAME MANNER AS FOR TRANSMITTER INSTALLED PER I.S. REQUIREMENTS, BECAUSE NONINCENDIVE REQUIREMENTS INCLUDE ONLY NORMAL OPERATING CONDITIONS.

FISCO CONCEPT APPROVALS

THE FISCO CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALY SAFE APPARATUS TO ASSOCIATED APPARATUS NOT SPECIALLY EXAMINED IN SUCH COMBINATION. FOR THIS INTERCONNECTION TO BE VALID THE VOLTAGE (U_i or Vmax), THE CURRENT (I_i or Imax), AND THE POWER (P_i or Pma) THAT INTRINSICALLY SAVE APPARATUS CAN RECEIVE AND REMAIN INTRINSICALY SAFE, INCLUDING FAULTS, MUST BE EQUAL OR GREATER THAN THE VOLTAGE (Uo, Voc, or Vt), THE CURRENT (Io, Isc, or It), AND THE POWER (Po or Pmax) LEVELS WHICH CAN BE DELIVERED BY THE ASSOCIATED APPARATUS, CONSIDERING FAULTS AND APPLICABLE FACTORS. ALSO, THE MAXIMUM UNPROTECTED CAPACITANCE (C_i) AND THE INDUCTANCE (L_i) OF EACH APPARATUS (BESIDES THE TERMINATION) CONNECTED TO THE FIELDBUS MUST BE LESS THAN OR EQUAL TO 5nF AND 10µH RESPECTVELY.
ONLY ONE ACTIVE DEVICE IN EACH SECTION (USUALLY THE ASSOCIATED APPARATUS) IS ALLOWED TO CONTRIBUTE THE DESIRED ENERGY FOR THE FIELDBUS SYSTEM. THE ASSOCIATED APPARATUS' VOLTAGE Uo (or Voc or Vt) IS LIMITED TO A RANGE OF 14V TO 24 V.D.C. ALL OTHER EQUIPENT COMBINED IN THE BUS CABLE MUST BE PASSIVE (THEY CANNOT PROVIDE ENERGY TO THE SYSTEM, EXCEPT A LEAKAGE CURRENT OF 50 µA FOR EACH CONNECTED DEVICE) SEPARATELY POWERED EQUIPMENT REQUIRES A GALVANIC ISOLATION TO AFFIRM THAT THE INTRINSICALLY SAFE FIELDBUS CIRCUIT WILL REMAIN PASSIVE. THE PARAMETER OF THE CABLE USED TO INTERCONNECT THE DEVICES MUST BE IN THE FOLLOWING RANGE:

LOOP RESISTANCE R':	15...150 OHM/km
INDUCTANCE PER UNIT LENGTH L':	0.4...1mH/KM
CAPACITANCE PER UNLIT LENGTH C':	80...200nF

C' = C' LINE/LINE +0.5C' LINE/SCREEN, IF BOTH LINES ARE FLOATING, OR
C' = C' LINE/LINE +C' LINE/SCREEN, IF THE SCREEN IS CONNECTED TO ONE LINE

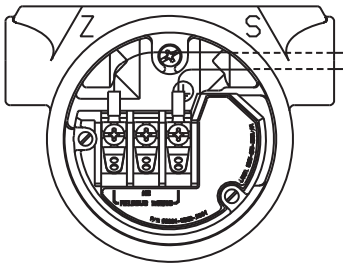
TRUNK CABLE LENGTH:	≤ 1000 m
SPUR CABLE LENGTH:	≤ 30 m
SPLICE LENGTH:	≤ 1 m

AN APPROVED INFALLIBLE LINE TERMINATION TO EACH END OF THE TRUNK CABLE, WITH THE FOLLOWING PARAMETERS IS APPROPRIATE:

R = 90...100 OHMS C = 2.2µF

AN ALLOWED TERMINATION MIGHT ALREADY BE LINKED IN THE ASSOCIATED APPARATUS. DUE TO I.S. REASONS, THE NUMBER OF PASSIVE APPARATUS CONNECTED TO THE BUS SEGMENT IS NOT LIMITED. IF THE RULES ABOVE ARE FOLLOWED, UP TO A TOTAL LENGTH OF 1000 m (THE SUMMATION OF TRUNK AND ALL SPUR CABLES), THE INDUCTANCE AND THE CAPACITANCE OF THE CABLE WILL NOT DAMAGE THE INTRINSIC SAFETY OF THE SYSTEM.

NOTES:
INTRINSICALLY SAFE CLASS I, DIV. 1, GROUPS A, B, C, D



1. THE MAXIMUM NON-HAZARDOUS AREA VOLTAGE MUST NOT EXCEED 250 V.
2. CAUTION: ONLY USE SUPPLY WIRES SUITABLE FOR 5°C ABOVE SURROUNDING TEMPERATURE.

ENTITY CONCEPT APPROVALS

THE ENTITY CONCEPT ALLOWS INTERCONNECTION OF INTRINSICALLY SAFE APPARATUS TO ASSOCIATED APPARATUS NOT SPECIFICALLY EXAMINED IN COMBINATION AS A SYSTEM. THE APPROVED VALUES OF MAX. OPEN CIRCUIT VOLTAGE (Voc) AND MAX. SHORT CIRCUIT CURRENT (Isc) AND MAX. POWER (Voc X Isc/4), FOR THE ASSOCIATED APPARATUS MUST BE LESS THAN OR EQUAL TO THE MAXIMUM SAFE INPUT VOLTAGE (Vmax), MAXIMUM SAFE INPUT CURRENT (Imax), AND MAXIMUM SAFE INPUT POWER (Pmax) OF THE INTRINSICALLY SAFE APPARATUS. IN ADDITION, THE APPROVED MAX. ALLOWABLE CONNECTED CAPACITANCE (Ca) OF THE ASSOCIATED APPARATUS MUST BE GREATER THAN THE SUM OF THE INTERCONNECTING CABLE CAPACITANCE AND THE UNPROTECTED INTERNAL CAPACITANCE (C_i) OF THE INTRINSICALLY SAFE APPARATUS, AND THE APPROVED MAX. ALLOWABLE CONNECTED INDUCTANCE (La) OF THE ASSOCIATED APPARATUS MUST BE GREATER THAN THE SUM OF THE INTERCONNECTING CABLE INDUCTANCE AND THE UNPROTECTED INTERNAL INDUCTANCE (L_i) OF THE INTRINSICALLY SAFE APPARATUS.

FOR OUTPUT CODE A

CLASS I, DIV. 1, GROUPS A, B, C AND D

V_{MAX} = 30V	V_{OC} IS LESS THAN OR EQUAL TO 30V
I_{MAX} = 200mA	I_{SC} IS LESS THAN OR EQUAL TO 200mA
P_{MAX} = 1 WATT	$(\frac{Voc \times Isc}{4})$ IS LESS THAN OR EQUAL TO 1 WATT
C_I = .01μf	C_A IS GREATER THAN .01μf + C CABLE
L_I =10μH	L_A IS GREATER THAN 10μH + L CABLE

* FOR T1 OPTION:

Imax = 160mA	I_{SC} IS LESS THAN OR EQUAL TO 160mA
L_I =1.05mH	L_A IS GREATER THAN 1.05mH + L CABLE

FOR OUTPUT CODE F or W

CLASS I, DIV. 1, GROUPS A, B, C AND D

V_{MAX} = 30V	V_{OC} IS LESS THAN OR EQUAL TO 30V
I_{MAX} = 300mA	I_{SC} IS LESS THAN OR EQUAL TO 300mA
P_{MAX} = 1.3 WATT	$(\frac{Voc \times Isc}{4})$ IS LESS THAN OR EQUAL TO 1.3 WATT
C_I = 0μf	C_A IS GREATER THAN 0μf + C CABLE
L_I = 0μH	L_A IS GREATER THAN 0μH + L CABLE

NOTE: ENTITY PARAMETERS LISTED APPLY ONLY TO ASSOCIATED APPARATUS WITH LINEAR OUTPUT.

Appendix G: Required Tools 45
Appendix H: Torque Values 46

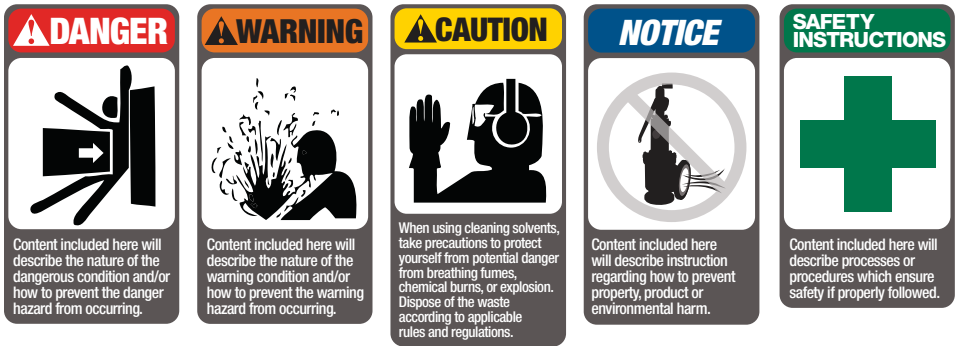
1. Introduction

This maintenance manual is provided because you have Farris Engineering 2600 Series pressure relief valves protecting equipment and personnel in your plant. We trust that you will find this manual useful, as it is intended to clearly present all the essential information you will need in order to keep your Farris valves in perfect operating condition.

Any maintenance and repair work or testing performed on Farris pressure relief valves should be done in strict accordance with the requirements of all applicable Codes and Standards. Persons performing the work should maintain proper authorization through applicable governing authorities.

To ensure reliable and safe operation, installation, testing, maintenance, adjustment, and repair of Farris valves, these activities shall only be performed by qualified personnel having the required skills and training. No repair, assembly, adjustment or testing performed by individuals other than Farris-authorized representatives shall be covered by the warranty extended by Farris to its customers. All applicable regulations, directives, codes and standards shall be adhered to when performing these activities. Failure to follow proper test procedures or failure to use proper test equipment will lead to incorrect test results, damage to the valve and will invalidate the warranty.

Farris Engineering provides programs which coordinate classroom and hands-on training. It is recommended that individuals performing pressure relief valve maintenance receive training specific to those valve series they expect to repair and set. Only this type of training will ensure the proper application of these instructions. The National Board of Boiler and Pressure Vessel Inspectors conducts training programs on valve repair in conjunction with their VR program. This is a broad-based program and is recommended to supplement training received from specific manufacturers.



These instructions do not cover all details or variations in equipment, nor do they provide for every possible contingency to be met in regards to installation, operation or maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes, please contact Farris Engineering.

2. Safety Warning and Instruction System

You will find safety warnings and instruction labels throughout this manual. These have been included to ensure your safety and must be followed. Safety labels are vertically oriented rectangles as shown in the samples below. These labels consist of three panels inside a border. Each safety label will communicate the following three key pieces of information. This information is communicated using narrative and pictorials.

- The nature and severity of the hazard
- The consequence of the hazard, if not avoided
- The precautions and measures required to avoid the hazard.

The top panel of the safety label illustrates the signal word (DANGER, WARNING, or CAUTION) which communicates the severity of the hazard, per the above explanations. The center panel contains a pictorial which communicates the nature of the hazard, and the possible consequence of hazard, if not avoided. In some cases, the pictorial may depict the precautions or measures required to avoid the hazard. The bottom panel will then contain the remaining narrative information needed to ensure all three key pieces of information have been conveyed.

DANGER:
Indicates hazards which, if not avoided, will result in death or serious injury.

WARNING:
Indicates hazards which, if not avoided, could result in death or serious injury.

CAUTION:
Indicates hazards which, if not avoided, could result in minor or moderate injury.

NOTICE:
"NOTICE" is reserved for instructions given to prevent property, product, or environmental harm.

SAFETY INSTRUCTIONS:
"SAFETY INSTRUCTIONS" indicates processes or procedures recommended to ensure safety.

General Safety Instructions

The maintenance manual is provided by Farris Engineering, a business unit of Curtiss-Wright Flow Control Company, to its customers as general guidance for the repair and maintenance of Farris valves described herein. Pressure relief/safety valves are critical components in pressurized systems to ensure the safety of people, the environment, and property. Always follow all manufacturer and industry standard recommendations relating to proper installation, testing, maintenance, and reconditioning.

This manual should not be considered an exhaustive manual. Certain configurations, applications, and usages may not be covered. If there is specific information needed which is not covered in this manual, the customer is advised to contact Farris using the contact information on the back of this manual. All information presented in this manual is subject to change without notice. The purchaser should contact Farris regarding any possible changes in information or specifications.

To ensure reliable and safe operation, installation, testing, maintenance, adjustment, and repair of Farris valves, these activities shall only be performed by qualified personnel having the required skills and training.

No repair, assembly, adjustment or testing performed by individuals other than Farris-authorized representatives shall be covered by the warranty extended by Farris to its customers. All applicable regulations, directives, codes and standards shall be adhered to when performing these activities. Failure to follow proper test procedures or failure to use proper test equipment will lead to incorrect test results, damage to the valve and will invalidate the warranty.

Likewise, use of parts in any maintenance or repair activity other than factory-supplied OEM parts will invalidate the warranty extended by Farris to its customers. Incorrect selection or application of Farris valves on the part of the customer is not covered by the warranty extended by Farris to its customers.

These general safety instructions have been provided not only to protect the product and warranty but also are provided for an individual's personal safety in handling Farris pressure relief valves. Failure to follow these procedures could result in severe bodily harm or even death.

- All possible hazards may not be identified in this manual. Conduct your own safety risk assessment given your specific system, environment, and configuration, and ensure proper control procedures are in place to prevent personal injury or illness and property, product or environmental harm.

DANGER

- When the valve is under pressure, do not place any part of your body near or in the path of the outlet of the main valve or other discharge areas. Doing so will result in serious injury or death upon release.
- If a test gag is provided with the valve, it must be removed prior to service installation. Failure to do so will result in equipment failure, serious injury or death in the instance of an overpressure event.

WARNING

- In certain applications it may be impossible to remove the valve from service. Never attempt to remove, adjust, maintain, or repair a pressure relief valve either while it is installed in a pressurized system or on a test stand, unless you have been properly trained to do so. Doing so may result in serious injury or death. Ensure the proper isolation of energy sources and residual pressures by complying with all local, state and country-specific regulations/directives applying to energy control procedures and “lockout/tagout.”
- Ensure that the pressure relief valve and system is at an ambient temperature before inspecting, servicing, or repairing. The valve, system, and contents may be extremely hot or cold. Failure do so may result in serious injury.
- The exhaust from the main valve outlet or any other ports that could exhaust, should be vented to a safe location to eliminate the potential for serious injury or damage during relief operation.
- Prior to valve disassembly, ensure that proper controls are implemented to address potential exposures to hazardous substances, including gases, liquids, or process byproducts contained in or contaminating the valve. Consult applicable material safety data sheets (MSDSs) and established exposure limits for the substances expected to be present to ensure proper exposure controls are implemented. Failure to do so could result in serious injury or illness.
- Ensure the valve is operable at all times and free of potential obstructions due to the conditions of use, or process fluid obstructions resulting from solidifications, byproducts, polymerization or other obstructions. Failure to do so could render the valve inoperable, leading to serious injuries or damage in the event of system over-pressurization.
- Use extreme caution when inspecting a pressure relief valve for leakage. Never use body parts to inspect for flow leaks. Doing so could result in serious injection, burn, or chemical injuries.
- Use all appropriate personal protective equipment to protect against process hazards, including but not limited to, pressurization, temperature extremes, noise, and chemical hazards. Failure to do so could result in serious injury or death.

CAUTION

- Always use the appropriate tools, and in the correct manner, for adjustment or servicing of valves. Failure to do so could result in injury.

SAFETY INSTRUCTIONS

- It is the responsibility of the customer and user of Farris valves to properly train their personnel on all required safety standards and procedures to prevent injuries and illnesses.

3. Serial and Type Numbering Systems

Familiarity with Farris valve type and serial numbering systems will greatly benefit anyone using this manual or any other Farris literature. The ability to recognize certain valve types and construction features along with identifying serial numbers will assist correct maintenance procedures and spare part selection/ordering. All Farris valve nameplates contain a specific valve type number and serial number unique to that particular valve. See Figure 1.2 on page 6 for an example of a typical 2600 Series nameplate.

Serial Numbering System

Each Farris pressure relief valve is assigned a unique serial number. This serial number is assigned by the factory and remains part of the factory records. Providing this serial number to the factory will assist in the identification of the construction and metallurgy of the valve in question. The following outline will give general guidelines on the serial numbering system used on 2600 Series valves.

Serial Suffix Summary For 2600 Maintenance Manual

Serial # Suffix	Valve Type	Description	Production Dates
-A15/H	2600L BalanSeal "O" Ring Seat Design (Liquid Service)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
-A14/H	2600L Conventional "O" Ring Seat Design (Liquid Service)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
-A15/G	2600L BalanSeal Metal Seat Design (Liquid Service)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
-A14/G	2600L Conventional Metal Seat Design (Liquid Service)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
-A15/M	2600L BalanSeal Design - "O" Ring (air, steam, vapor & liquid services)	Modified "D" through "K" orifice "O" ring seat design that replaced original A14 & A15 "O" ring seat design. Starts at Serial #'s above 300000.	July 1993 - present
-A14/M	2600L Conventional Design - "O" Ring (air, steam, vapor & liquid services)		
-A15	2600L BalanSeal Design (air, steam, vapor & liquid services)	Full nozzle valves conforming to API Standard 526 with ASME Section VIII certification for liquid service. Air & steam certification added in 2005.	1985 - present
-A14	2600L Conventional Design (air, steam, vapor & liquid services)		
-A13	2600 & 2600L BalanSeal Piston Design - All design variations and Services	2600 & 2600L Balanced Piston version of standard 2600 BalanSeal Design. Use of serial suffix changed from A12 to A13 for consistency of numbering system.	Nov. 1997 - present
-A12			1978 - Nov. 1997
-A11/R	2600 BalanSeal Design - "O" Ring (air, steam, & vapor services)	Modified "D" through "K" orifice "O" ring seat design that replaced the modified A10/M & A11/M "O" ring seat design. Starts at Serial #'s above 312123.	August 1996 - present
-A10/R	2600 Conventional Design - "O" Ring (air, steam, & vapor services)		
A11/N	2600 & 2600L BalanSeal Design (air, steam, vapor & liquid services)	Special version of 2600 series built to military specifications with MIL Spec. flanges and semi-nozzle construction	2000 - present
A10/N	2600 & 2600L Conventional Design (air, steam, vapor & liquid services)		2000 - present
A11/H	2600 BalanSeal "O" Ring Seat Design (air, steam, & vapor services)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
A10/H	2600 Conventional "O" Ring Seat Design (air, steam, & vapor services)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
A11/G	2600 BalanSeal Metal Seat Design (air, steam, & vapor services)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
A10/G	2600 Conventional Metal Seat Design (air, steam, & vapor services)	Improved "G" orifice (150# & 300# Class only) and "F" orifice designs.	2006 - present (G) 2011 - present (F)
-A11/M	2600 BalanSeal Design - "O" Ring (air, steam, & vapor services)	Modified "D" through "K" orifice "O" ring seat design that replaced original A10 & A11 "O" ring seat design. Starts at Serial #'s above 300000.	July 1993 - July 1996
-A10/M	2600 Conventional Design - "O" Ring (air, steam, & vapor services)		July 1993 - July 1996
-A11	2600 BalanSeal Design (air, steam, & vapor services)	Full nozzle valves conforming to API Standard 526 with nozzles revised to incorporate ASME 0.9 capacity reduction factor.	1976 - present
-A10	2600 Conventional Design (air, steam, & vapor services)		
-A9	BalanSeal Bellows Design	Full nozzle valves conforming to API Standard 526.	1959 - 1976
-A8	Conventional Design		
-A3, A5, & A7	BalanSeal Bellows Design	Includes both 2605 & 2675 Series	1955 - 1967
-A2, A4, & A6	Conventional Design		
-A	Full nozzle valves, conventional and BalanSeal bellows types.	Serial suffix covers all types of construction including Conventional, FarriSeal, BalanSeal, enclosed and exposed spring designs.	1943 - 1955

Note: Valves covered by serial number suffixes in RED are for obsolete designs.

Type Numbering System

Our type numbering system simplifies the selection and specifying of Farris pressure relief valves because the digits that comprise a specific type number have a distinct significance. The digits describe the basic valve series, orifice, seat and internal construction, inlet temperature range, body, bonnet and spring material, inlet flange class and Code liquid design.

Prefix (if applicable)	26	D	A	1
	Series Number	Orifice Areas	Construction	Temperatures & Materials

H* Set Pressure Above API 526

*The U – Z orifices are not API standard sizes. U – Z metric areas = cm^2.
This manual only covers maintenance for D – U orifices. For larger orifices, please consult the factory.

A Conventional construction

B BalanSeal construction

C Conventional with O-ring seat pressure seal

D BalanSeal with O-ring seat pressure seal

E BalanSeal with auxiliary balancing piston

F BalanSeal with auxiliary balancing piston and O-ring seat pressure seal

T Teflon seat, conventional

U Teflon seat, BalanSeal

Designation	Inlet Temperature Range °F	Material: Body & Bonnet	Material: Spring
1	-20 to 800	Carbon Steel	Chrome Alloy
2**	451 to 800	Carbon Steel	Chrome Alloy
3	801 to 1000	Chrome Moly Steel	High Temp. Alloy
4*	1001 to 1200	—	—
5*	1201 to 1500	Austenitic St. St.	Inconel Alloy
1	-21 to -75	Use “S3” Trim Options	
1	-76 to -450	Use “S4” Trim Options	
6	-21 to -75	3-1/2% Nickel Steel	Carbon Steel
7	-76 to -150	3-1/2% Nickel Steel	Austenitic St. St.
8	-151 to -451	Austenitic St. St.	Austenitic St. St.

* Temperature ranges 4 and 5 are beyond the scope of this catalog. Consult the Factory.

** Temperature range 2 is no longer used as the standard range valve handles temperatures to 800°F.

Note: Items listed in **RED** are for non-current nomenclature designations or options no longer offered.

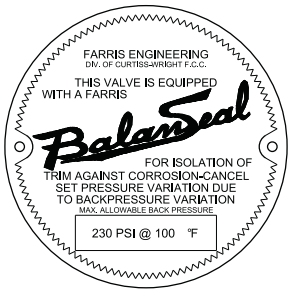

Figure 1.1 – BalanSeal Identification Plate

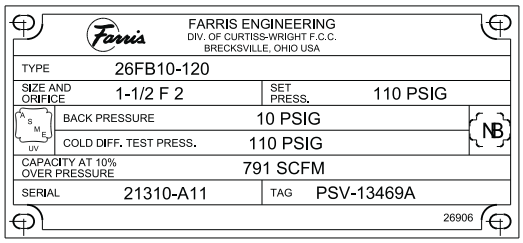

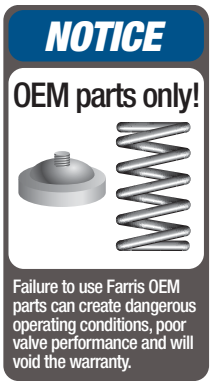

Figure 1.2 – Typical Farris Nameplate

Parts Replacement

Valves – If an exact replacement valve is required, then the valve type, size and serial number must be specified to ensure proper dimensions and material being supplied. If a specific valve is obsolete, a recommendation of the current equivalent will be made if possible.

Spare Parts – When ordering parts, use part names as listed in the bills of materials. Specify valve type, size and serial number. If the serial number is not available, the original Farris factory order number will help us supply the proper part and material.

Springs – Order as an assembly to include spring with upper and lower spring buttons. Specify valve type, size, serial number, set pressure and backpressure, if any.

Note: If valve modification or set pressure changes are required, consideration must be given to correct the nameplate and other data.

1. Spring adjusting screw in standard material
2. The springs shown assume bellows construction. For conventional construction, use Inconel X750.

4. Valve Cross-Section, Parts and Construction

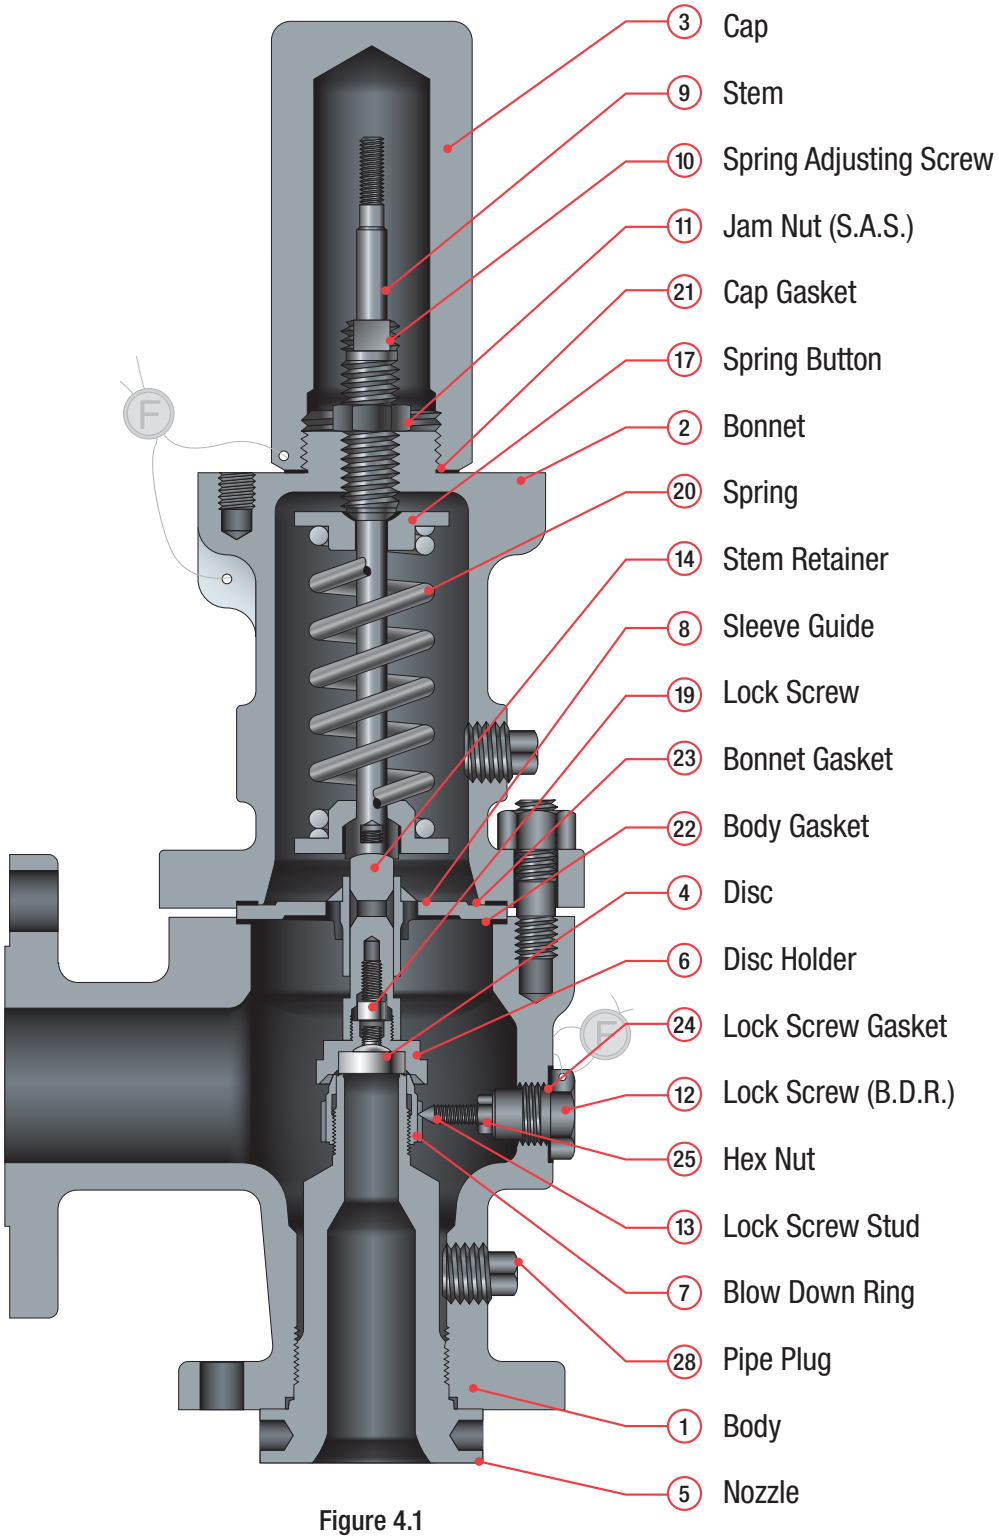

Figure 4.1

General Notes:
The safety valve cross-section illustrated is typical and actual construction details will vary depending on valve size and pressure rating.
Consult the other illustrations contained elsewhere in this manual for greater detail or consult the factory for a cross-section drawing for the actual valve size and pressure rating.

5. Valve Removal and Pre-Inspection

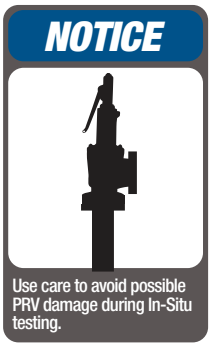
General Handling:

After the pressure relief valve is removed from the installation it should be transported to the shop for inspection, testing, maintenance, and resetting. Careful handling in transit is important, as rough handling can change the pressure setting or deform the pressure relief valve parts so they cannot be set or function properly. Flanges on the piping and flange faces on the valve should be protected so that gasket faces are not damaged. Large valves should be handled with suitable rigging equipment to avoid dropping or rough handling. Pressure relief devices should not be stocked in a careless manner and, where practical, they should be segregated and not stored with heavy pipe fittings or other types of valves. Pressure relief valves should be treated as delicate instruments because their accurate functioning is very important to safe plant operation.

Because cleanliness is essential for the satisfactory operation and tightness of a pressure relief valve, all necessary precautions should be taken to keep out foreign materials. Valves which are not installed soon after repair should be closed off properly at both inlet and outlet flanges. Particular care should be taken to keep the valve inlet and internals absolutely clean. Preferably, valves should be stored indoors or in locations where dirt and other forms of contamination are at a minimum. Valves should be handled carefully and not subjected to heavy shocks. If due consideration is not given to this point, some internal damage or misalignment can result and seat tightness may be adversely affected. Store, transport and install valves with the stem in the vertical position.

In practice, a repaired pressure relief valve including one that has been only cleaned or readjusted is called upon to provide the same degree of protection as a new valve. It follows that maintenance personnel must be trained to a level of proficiency that enables them to restore a valve to original condition and function. It is recommended that historical records be established and maintained including test reports. This will provide data to determine the frequency of inspection and repair for various services. One excellent publication for reference on pressure relieving devices is the American Petroleum Institute's (API) **Recommended Practice RP 576, Inspection of Pressure-Relieving Devices**. The use of original manufacturer's replacement parts is necessary to maintain new valve performance, capacity flow and warranty. Farris Engineering expressly voids its warranty and will not be responsible for faulty valve operation if non-factory replacement parts or methods are utilized in product repair.

Field Removal



A visual inspection of pressure relief valves should be made when the valves are first removed from the system. Many types of deposits or corrosive debris may be loose and drop out from the pressure relief valve while it is being transported to the shop. When fouling is a frequent problem, it may be desirable to collect samples for further testing and to make notes regarding deposit location and appearance. Any obstructions in the valve should be noted and corrected.

Inspection of Inlet and Outlet Piping

When a pressure relief valve is removed from service, the upstream and downstream piping is often open and available for inspection. However, where it is the practice to remove pressure relief devices from equipment during operation by closing block valves, it is usually not possible to make a complete inspection of piping. Such inspection should be made when the operation equipment is out of service. Inspection of the piping at the pressure relief valve will often indicate the condition of other process piping which is not readily available for inspection. Piping should be checked for corrosion, indications of thinning and deposits which may interfere with valve operation. The characteristics of the deposits may supply clues regarding leakage from the pressure relief valve in a closed system.

In-Situ Testing

In-situ or in place testing is frequently performed as a substitute for valve removal and in-shop testing. This should not be considered as equivalent to shop maintenance; however it may be employed under controlled situations to extend the shop service frequency of particular valves. The most common method of in-situ testing employs an external power source applied to the valve to determine the valve set pressure at some lower system pressure. While this method can accurately determine the valve set pressure, valve reseat pressure cannot be determined using the method. Care must be exercised with this method to avoid possible valve damage that may go undetected during the in-situ test.

In-Shop Inspection

When a valve is first received in the shop it should be given a visual inspection to note its condition when removed from service. The results of this inspection should be noted on appropriate forms. It is generally considered important to determine the set pressure of the valve when removed from service and prior to the valve being disassembled. If the valve opens at the set pressure, the valve need not be tested further to determine the as-received relieving pressure. If the initial pop is higher than the set pressure, it is advisable to test a second time. If the valve then pops at approximately the set pressure, this indicates that the valve was probably stuck because of deposits. If the valve does not pop near the set pressure, this indicates that the valve setting was either in error originally or may have been changed during operation.

Valves which are found acceptable upon shop pre-test cannot be returned to service with a National Board “VR” stamp being applied unless they are completely disassembled and complete repairs are undertaken. Some maintenance programs may however authorize valves found acceptable on shop pretest to be returned to service based on historical records, tear-down cycles and all seals and valve identifications remaining intact.

Preparation For Maintenance

Before valve teardown is performed a review of previous maintenance records will assist in an understanding of past valve performance, settings and maintenance requirements. A complete maintenance records management system will allow proper stocking of common replacement items such as gaskets and seals and adequate stocking of major replacement parts such as nozzles, discs, and springs. Maintenance records, when properly updated, can serve to identify the need for ordering spare parts when valve servicing shows that the useful life of a particular part has been reached. Rework details and installation of new parts should be recorded to aid future service activities.

6. Disassembly Instructions

General Disassembly of Valves

After the valve is received and checked it is ready for shop inspection and repair. The valve should be carefully dismantled. If you are unfamiliar with this line of Farris valves carefully study the cross-sectional drawings in Figures 4.1 through 4.5 to familiarize yourself with part terminology and location. Proper facilities should be available for segregating parts as the valve is dismantled. At each stage in the dismantling process, all parts of the valve should be visually inspected for evidence of wear and corrosion. If parts are worn, replace them. See Appendix G for necessary tools.

The following general points will provide a brief checklist to follow during disassembly. Detailed discussion will follow for specific critical parts.

- Check for the presence of wire seals at all points of adjustment.
- Check for complete and properly identified nameplates and tags.
- Check the condition of flanges; look for evidence of pitting, roughening, deterioration of gasket surface, distortion, etc.
- Visually inspect springs for evidence of corrosion, cracking, and correct selection.
- Visually inspect bellows (if the valve is of bellows type).
- Examine o-ring condition (if applicable).
- Visually inspect inlet and outlet openings; look for evidence of deposits of foreign material and for corrosion. Note the condition of external surfaces and look for any indication of corrosion or evidence of mechanical damage.
- Check and note the body, nozzle and bonnet wall thickness, thread and stud condition.
- Verify valve components and material and check against nameplate information.

Disassembly Instructions:

Farris 2600 Series valves should be disassembled as described below. Parts identification may be found in Figure 4.1 on page 8. The parts from each valve should be properly marked and segregated to keep them separate from parts used in other valves.

1. Cut the wire seals and remove the **Cap** [3] and **Cap Gasket** [21]. For valves equipped with a lifting lever, follow the instructions in Appendix D. **(Figure 6.1)**
2. Before loosening the **Jam Nut** [11], measure the location of the **Spring Adjusting Screw (SAS)** [10] by marking the **SAS** [10] above the **Jam Nut** [11]; or by counting the number of counter clockwise revolutions of the **SAS** [10] until the **Spring** [20] is no longer compressed. This will allow the approximate set pressure to be re-established when reassembling the valve. **(Figure 6.2)**
3. Remove the **Jam Nut** [11] and **SAS** [10].

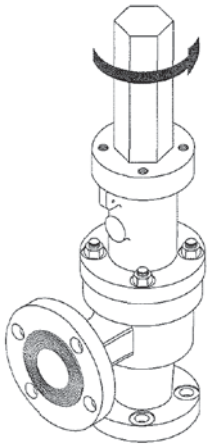


Figure 6.1

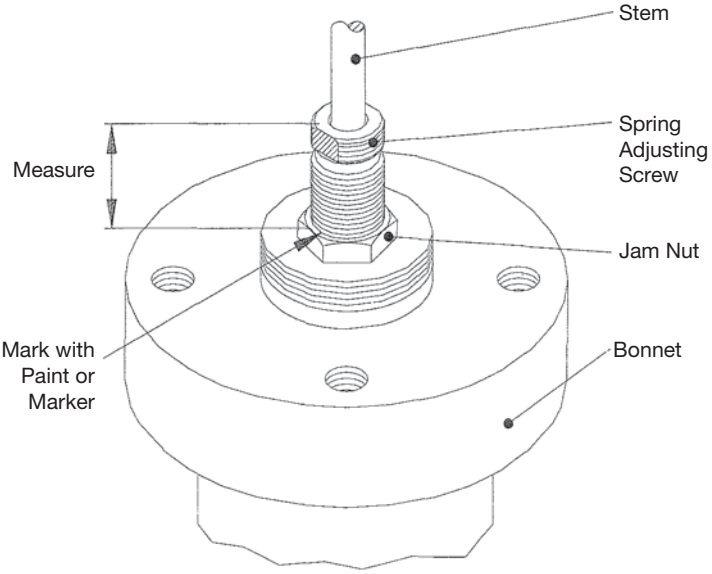

Figure 6.2

4. Remove the **Blow Down Ring Lock Screw** assembly [12,13, 25] and **Lock Screw Gasket** [24]. Record the position of the **Blow Down Ring** [7] with respect to the **Disc Holder** [6] by counting the number of notches required to raise the ring until it just touches the **Disc Holder** [6]. This information will be needed again when reassembling the valve. **(Figure 6.3)**
5. Remove the **Body Hex Nuts** [19]
6. Record the position of the bonnet drain relative to the valve outlet and remove the **Bonnet** [2].
   a. On larger valves, the combination of bonnet weight and the height that it must be lifted to clear the **Stem** [9] requires that a hoist be used to remove the **Bonnet** [2]. During this operation, the valve **Body** [1] should be secured to prevent it from tipping over once the **Bonnet** [2] is removed.
   b. Use care when lifting the **Bonnet** [2] as the **Spring** [20] and **Stem** [9] will be able to tip over.
7. Remove the spring assembly (**Spring** [20] and **Spring Buttons** [17]) from the **Stem** [9]. The spring assembly must be kept together. The **Spring Buttons** [17] should be tagged for later identification as the upper and lower buttons may not be identical.

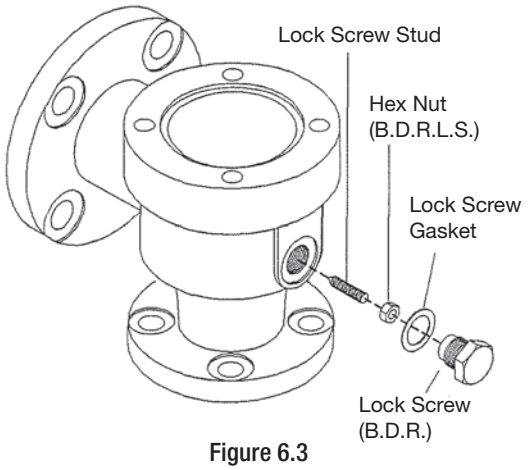

Figure 6.3

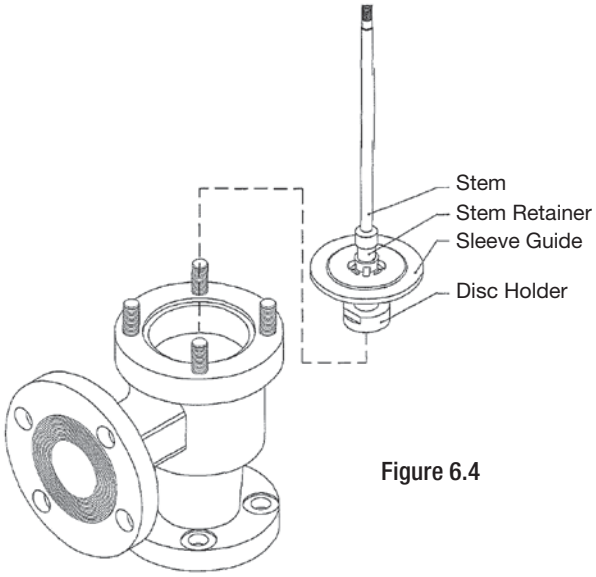

Figure 6.4

8. Using the **Stem** [9] as a handle, lift the complete internal assembly from the valve **Body** [1]. **(Figure 6.4)**
   a. On larger valves a hoist is advisable due to the weight of the internal assembly.
   b. An eye bolt may be attached to the stem test washer thread at the end of the **Stem** [9] to assist in lifting.
   c. For balanced bellows valves, use care not to damage the bellows assembly.
   d. If parts are difficult to remove due to the presence of corrosive or foreign material soaking in a suitable solvent may be required.
9. Remove the **Body Gasket** [22] and **Bonnet Gasket** [23].
10. To remove the **Stem** [9] from the **Stem Retainer** [14], lift up on the **Stem** [9] while holding the **Stem Retainer** [14] down and rotate counter-clockwise at the same time. This will engage the thread. Continue rotating until the **Stem** [9] is removed. **(Figure 6.5)**

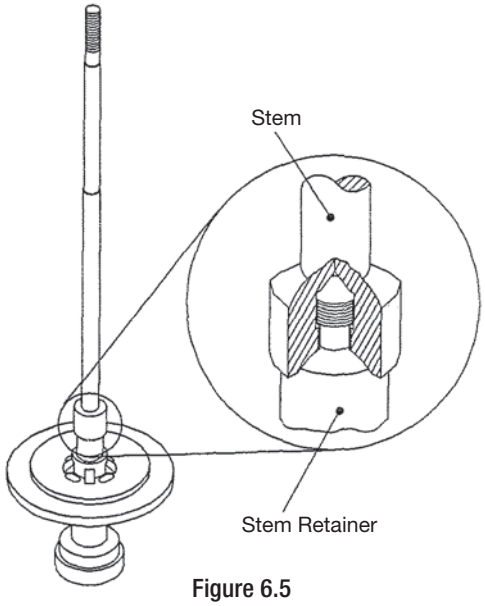

Figure 6.5

11. Remove the **Disc** [4] from the **Disc Holder** [6] **(Figure 6.6)**.
    a. Hold the assembly and rotate the **Disc** [4] with the tip of your finger.
    b. For o-ring seat type valves, refer to Appendix C for instructions.
12. To separate the **Disc Holder** [6] from the **Stem Retainer** [14], first thread the lock screw up into the **Stem Retainer** [14] using the fixture shown in **Figure 6.7** to hold the assembly.
    a. Except for the D & E orifice bellows (A11) designs which have a one piece stem retainer/disc holder, the **Stem Retainer** [14] and **Disc Holder** [6] are held together with a **Disc Holder Lock Screw** [26].
    b. The **Disc Holder Lock Screw** [26] has a hex socket requiring the use of an Allen key **(Figure 6.8)**.
    c. Locking tension is relieved by threading the lock screw UP INTO the **Stem Retainer** [14].

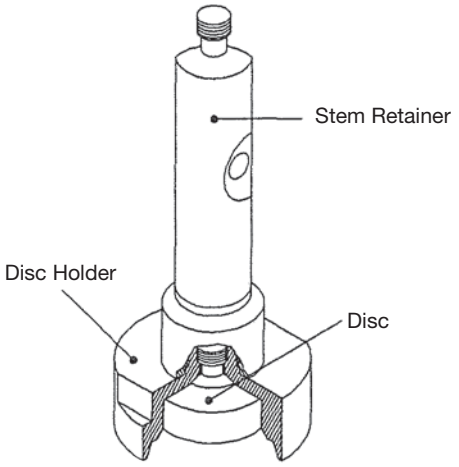

Figure 6.6

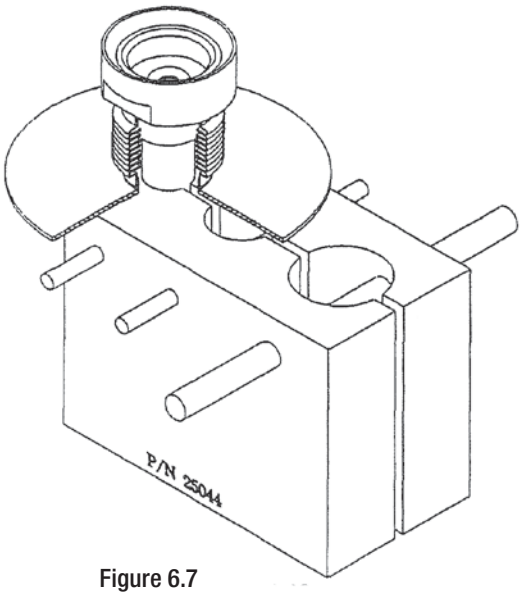

Figure 6.7

    d. Allen key wrench sizes are shown in **Table 6.1**.
    e. Be careful not to damage the guiding surface of the **Stem Retainer** [14] during disassembly.
    f. For bellows valves see Appendix B.
13. Remove the **Blow Down Ring** [7] from the **Nozzle** [5].
14. Turn the valve **Body** [1] over and re-clamp to the work bench. With a spanner wrench and mallet, remove the **Nozzle** [5] from the **Body** [1]
    a. Some valves may use wrenching flats instead of spanner holes.

NOTES:

1. **For BalanSeal Bellows construction,** please see Appendix B for disassembly instructions.
2. **For O-Ring seat construction,** please see Appendix C for disassembly instructions.
3. **For open lever, packed lever and bolted cap construction,** please see Appendix D for disassembly Instructions.

7. Cleaning and Inspection

7.1 Cleaning

Blast Cleaning

2600 Series body, bonnet and cap castings can be sand or bead blasted. When blast cleaning, exercise caution to protect internal and machined surfaces to avoid causing damage. Protect the nameplate prior to blast cleaning. It is not recommended to blast internal parts.

Brush Cleaning

Internal parts (except for guiding surfaces) and the inside of the body and bonnet castings can be cleaned with a wire brush and/or grinder until they are clean. Exercise caution when brush cleaning to avoid damaging or eroding the parts. Only clean stainless steel brushes should be used on stainless steel components.

Immersion/Washing

Castings and internal parts should be thoroughly cleaned with an appropriate solvent or cleaning solution. After immersion/washing, ensure that any residue is removed and parts are dried completely.

Polishing

Guiding surfaces on the stem, stem retainer and guide can be polished using a fine emery cloth.

CAUTION

When using cleaning solvents, take precautions to protect yourself from potential danger from breathing fumes, chemical burns, or explosion. Dispose of the waste according to applicable rules and regulations.

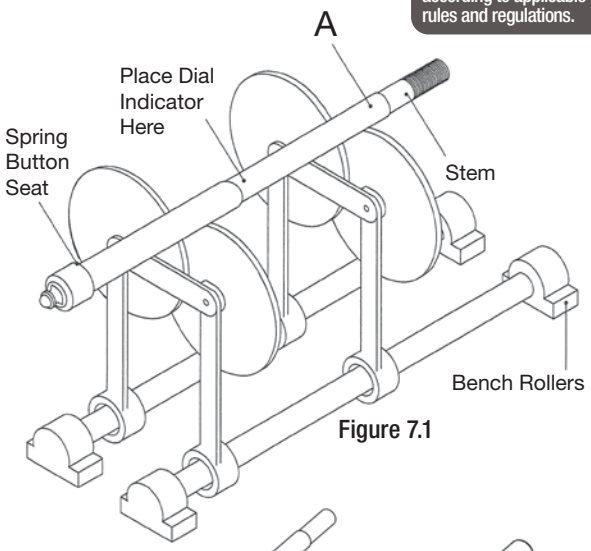

Figure 7.1

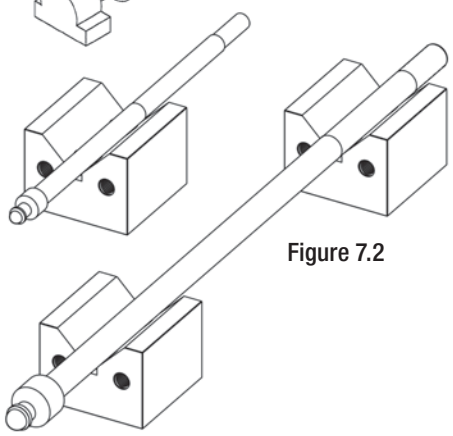

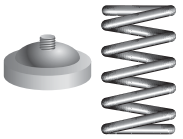

Figure 7.2

7.2 Inspection

NOTICE

OEM parts only!

Failure to use Farris OEM parts can create dangerous operating conditions, poor valve performance and will void the warranty.

Check all valve parts for wear and corrosion. Inspection of valve components is important to ensure proper valve performance. **Damaged valve parts must be repaired or replaced with OEM parts.**

The valve seat (nozzle and disc) must be examined to determine if they have been damaged. Typically, lapping the nozzle and/or disc is all that is needed to restore these parts to their original condition. Prior to lapping, or If machining is necessary, consult section 8 and Appendix E, Critical Dimensions.

The valve spring should be inspected for evidence of cracking, pitting, corrosion or deformation. If any of these are found, the spring should be replaced.

The guiding surfaces on the sleeve guide and stem retainer should be checked for evidence of pitting, corrosion, distortion or galling. If found, these parts should be replaced.

Stems should be inspected as follows:

1. Check the bearing point on the stem tip for a smooth surface. Lap if necessary against the mating part to improve the surface. If the spherical contact is destroyed, the stem should be replaced.
2. Check the critical stem areas for concentricity using the following procedures (Figure 7.1 and 7.2):
   a. Using “V”-Blocks or bench rollers, check the stem at the midpoint and also at the lower spring button radius for any runout.
   b. By applying a machinist’s dial indicator and rotating the stem, the total indicator reading should not exceed 0.007 inches. Straighten if necessary.
3. The top area of the stem just below the threads serves as the valve’s upper guiding surface in conjunction with the spring adjusting screw. This area is supplied from the factory with a 63 AARH finish. This area should be free from any signs of galling, corrosion, distortion or pitting. If seen, the stem should be replaced.

For BalanSeal valves, the bellows should be inspected for evidence of cracking, pitting, corrosion or deformation that might develop into a leak.

Check and inspect all gaskets for evidence of damage or corrosion. Typically, gaskets should be replaced prior to assembly.

8. Maintenance and Repair Procedures

Nozzle Refacing

1. Prior to refacing the nozzle seating area, grip the nozzle flange in a lathe chuck fitted with soft jaws (preferably with removable top jaws), and bored on each set-up to fit the nozzle flange outside diameter.
2. True up the nozzle by means of an indicator, ensuring that the nozzle bore and the machined surface between the nozzle threads and body sealing surface are concentric with each other, within 0.002" full indicator reading.
3. Machine a light cut across the seat until the damaged areas are removed, ensuring compliance with Appendix E. The seat should be machined to the smoothest possible finish. Rigidity of the cutting tool is critical.
4. Relap to the required finish.
5. Discard and replace the nozzle when the length from the seat to the flange becomes less than the minimum specified by the manufacturer. Do not reduce the nozzle flange thickness in an attempt to maintain the “L” dimension. The valve center to face dimension will be altered as a result and nozzle strength may be impaired.
6. See Appendix E for Critical Dimensions.

Disc Refacing

1. Prior to refacing the disc seating area, grip the disc outside diameter in a universal three-jaw lathe chuck fitted with soft jaws (preferably with removable jaws), and bored on each set-up to the disc outside diameter. Avoid excessive chucking force.
2. True up the disc by means of an indicator, ensuring that the disc outside diameter and seat face are true with each other within 0.002" full indicator reading.
3. Machine light cuts across the seat at 90° to the axis until the damaged areas are removed, facing to the smoothest possible finish. Rigidity of the cutting tool is critical.
4. Relap flat across the full width of the raised seating surface.
5. Discard and replace the disc when the thickness is less than the value in Appendix E.
6. See Appendix E for Critical Dimensions.

Lapping Compounds

The three grades of Farris Lapping Compounds are prepared especially for the requirements of pressure relief valves. These are the only compounds recommended for achieving extreme valve tightness, These compounds are available in 2 ounce tubes. Use sparingly.

Farris Lapping Compounds

Part No.	Grade	Finish	Size
18632X1 (055)	3F	Roughing	1/2 oz. tube
18633X1 (075)	38-500	Medium	1/2 oz. tube
18634X1 (105)	38-1200	Final	1/2 oz. tube

Lapping Procedures (Manual)

1. Use a cast iron lapping block or Pyrex lapping glass which is known to have a perfectly flat face.
2. Select the appropriate lapping compound. When lapping the disc, operate with a light figure eight motion over entire block surface. In this way complete contact will be made (Figure 8.1).

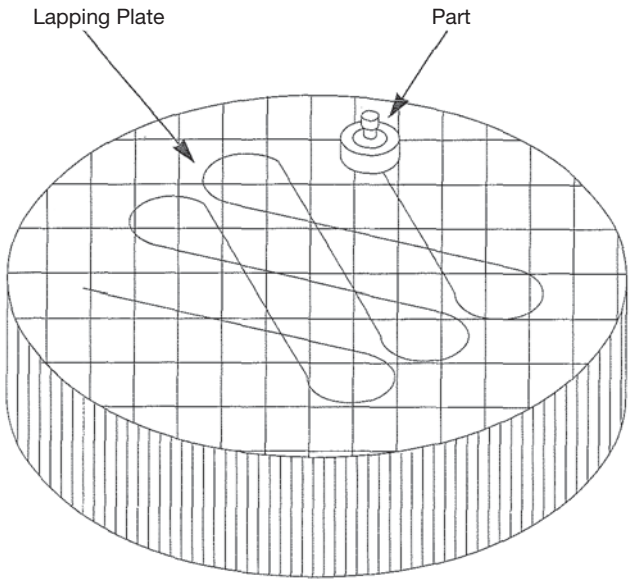

Figure 8.1

3. Lap the disc until all blemishes and score marks have been removed. As the figure eight motion is executed, frequently lift the disc away from the block to get a fresh bite on the compound. Most important, do not contaminate compounds with dirt. Store lapping blocks and lapping glass in a clean, dust-free area.
4. Follow the same procedure for lapping the nozzle. When lapping nozzles, the nozzle can be placed on a table and a lapping block placed on the nozzle. Be sure that the lapping block does not tip over the side of the nozzle (which would cause rounding of the edges). Use a light, rapid figure eight stroke, lifting the block from the nozzle occasionally.
5. When finished, be sure that all parts are carefully cleaned of all lapping compound using a suitable solvent. Residual compound may damage the seating surfaces during valve operation. When reassembling the parts in the valve be careful not to scratch or score the seating surfaces.
6. If the nozzle or disc is badly scored or pitted a fine machine cut should be made to reface the surfaces following instructions in the refacing section of this manual.

Lapping Procedures (Machine)

Lapping machines come in a variety of styles. There are limitations to the parts that can be lapped, which may be due to constraints of the lapping machine or the nature of the part to be lapped.

Limitations:

1. **The size of the lapping machine.**
   Obviously, you will be limited by the size of the lapping plate on the machine. A part that is larger than the lapping plate capacity will have to be hand lapped.
2. **The weight of the part to be lapped.**
   Some parts will be too heavy to lap on the machine, relative to the area to be lapped. These parts will have to be hand lapped.
3. **How well the part can be balanced on the lapping machine.**
   Due to geometry and weight distribution of the part, the part may tend to wobble or fall over in the lapping machine. For these types of parts a holding fixture should be designed or the part should be lapped by hand.

General Operation

This is a general procedure for the use of lapping machines. ALWAYS FOLLOW THE MANUFACTURER'S OPERATING INSTRUCTIONS.

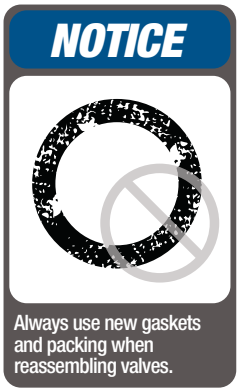
Thoroughly clean all contaminates from the seat area of the nozzle or disc to be lapped. Place the nozzle or disc seating area on the lapping plate. Turn on the machine and adjust the flow of lapping fluid which should be enough to keep the lapping plate covered with a thin film. The lapping plate should be neither dry nor overly lubricated.

The duration of time that the nozzle or disc should be lapped is dependent on the weight of the part, the hardness of the material, and the area to be lapped. A combination of a heavy part with a small area to be lapped made from a soft material will take the shortest time to lap. A combination of a light part with a large area to be lapped made from a hard material will take the longest time to lap.

Once the lapping is complete, remove the nozzle or disc from the lapping plate and remove the lapping fluid with soft tissue and suitable solvent. Protect the seating areas with soft tissue covered by a plastic cap.

Lapping Machine Maintenance and Seat Inspection

Seat flatness is critical to achieving leak tight seats. As the width of most pressure relief valve seats is quite narrow, it is difficult to check seat flatness directly with a monochromatic light. Instead, a standard test block should be kept on the lapping machine that can be periodically checked to determine the condition of the lapping plate. If the test block "reads" flat then all parts lapped on the machine will also be flat. Since the lapped surface needs to be reflective in order to "read" the surface flatness using a monochromatic light source and optical flat, a polishing stand is a needed accessory. Remove the test block from the lapping machine and clean off all lapping fluid. Rub the test block on the polishing stand as if you were hand lapping the test block. Only a few strokes will be necessary to make the surface reflective enough to allow reading the lines produced by the monochromatic light. For full details on how to read these lines and the subsequent adjustments of the machine consult the lapping machine manufacturer.



The quality of the lapped surface produced by the lapping machine can only be as good as the level of maintenance of the machine itself.

9. Assembly Instructions

Lubrication and Sealant:

Threaded parts should be lubricated to prevent galling, especially parts made of similar materials. In addition, guides and pivot points should contain lubricant which is compatible with the service conditions. Sealant should also be applied to prevent fluid from escaping valve boundaries, especially if back pressure is present. The adjacent table lists the suggested lubricant and sealant for air, steam, and liquid service. Service conditions may dictate that other lubricant or sealant be used.

Item	Thread Lubrication	Air	Steam	Liquid
1	Pipe Plug/Body	A	A	A
2	Lock Screw (BDR) Body	A	A	A
3	Blowdown Ring/Nozzle	D	D	D
4	Lock Screw Stud/Jam Nut (BDRLS)	A	A	A
5	Disc/Disc Holder	A	A	A
6	Stem Retainer/Disc Holder (if Applicable)	A	A	A
7	Lock Screw (DH)/Stem Retainer	A	A	A
8	Stem Retainer/Stem	A	A	A
9	Pipe Plug/Bonnet (if applicable)	A	A	A
10	Spring Adjusting Screw/Bonnet/Jam Nut	A	A	A

Code for Above Recommended Lubrication and Sealant

A = Bostic Never Seez
B = Molykote 3452
D = No Lubrication

* Service conditions may require an alternate lubricant or sealant

Assembly Instructions

Farris 2600 Series valves should be assembled as described below. Parts identification may be found in Figure 4.1 on page 8.

For torque requirements, please refer to Appendix H.

1. Thread the **Nozzle** [5] into the **Body** [1].
2. Thread the **Pipe Plug** [28] into the **Body** [1].
3. Thread the **Blow Down Ring** [7] onto the **Nozzle** [5].
4. Thread the **Hex Nut** [25] onto the **Lock Screw Stud** [13]. Thread the **Lock Screw Stud** [13] into the **Lock Screw** (BDR) [12].
5. Thread the **Lock Screw Assembly** into the **Body** [1] including the **Lock Screw Gasket** [24]. Adjust the position of the **Lock Screw Stud** [13] so that it prevents rotation of the **Blow Down Ring** [7] yet does not bind it. Use the position noted during disassembly. **(Figure 9.1)**
6. Thread the **Body Studs** into the **Body** [1].
7. Place the **Body Gasket** [22] in the **Body** [1] counter-bore.
8. Thread the **Lock Screw** [19] into the **Stem Retainer** [14]. **(Figure 9.2)**

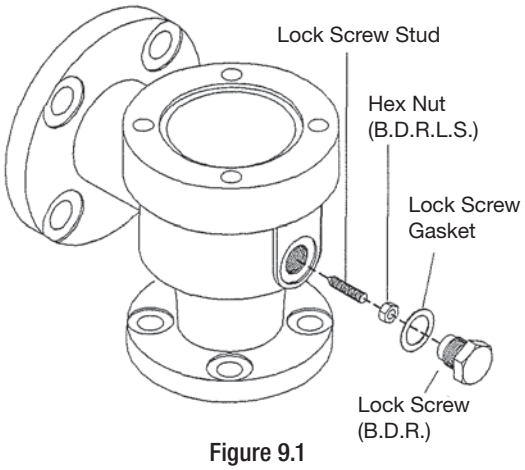

Figure 9.1

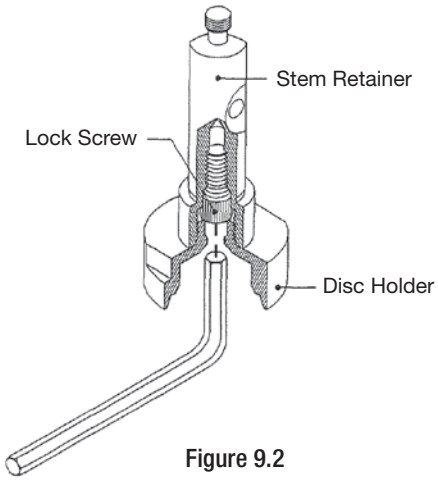

Figure 9.2

9. Thread the **Disc Holder** [6] onto the **Stem Retainer** [14] using a special assembly block **(see Figure 9.3)**. Do not attempt to hold the **Stem Retainer** [14] on the guiding surface. Thread the **Lock Screw** [19] counter clockwise until contact is made with the **Disc Holder** [6]. Tighten to lock the assembly together.
10. Thread the **Disc** [4] into the **Disc Holder** [6]. Be sure the **Disc** [4] is free-floating. **(Figure 9.4)**
11. Place the **Sleeve Guide** [8] over the **Stem Retainer** [14] with the long lift stop facing down. Be sure that the guiding motion is smooth.
12. Thread the **Stem** [9] and **Stem Retainer** [14] together. Be sure this connection is free-floating. **(Figure 9.5)**
13. Lower the **Assembly (Stem** [9], **Sleeve Guide** [8], and **Disc Holder** [6]) into the **Body** [1] counter-bore. **(Figure 9.6)**
14. Place the **Bonnet Gasket** [23] on the **Sleeve Guide** [8], or secure with sealant in the **Bonnet** [2] counter-bore.
15. Place the lower **Spring Button** [17] on the **Stem** [9]. **Caution** – in some valve sizes the upper and lower **Spring Buttons** [17] are different.
16. Place the **Spring** [20] on the lower **Spring Button** [17].

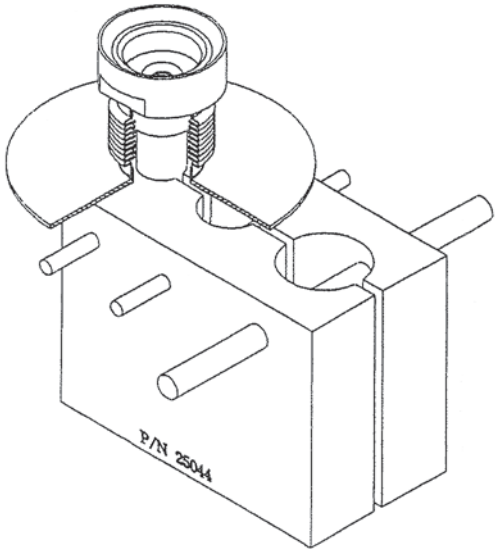

Figure 9.3

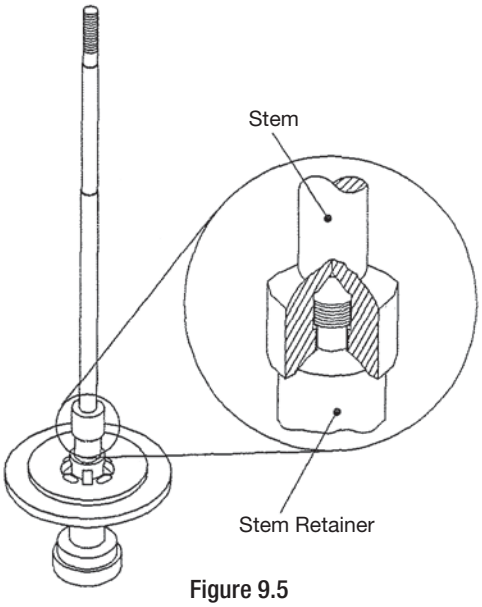

Figure 9.5

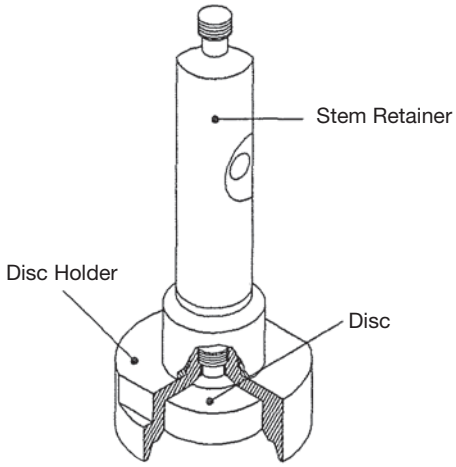

Figure 9.4

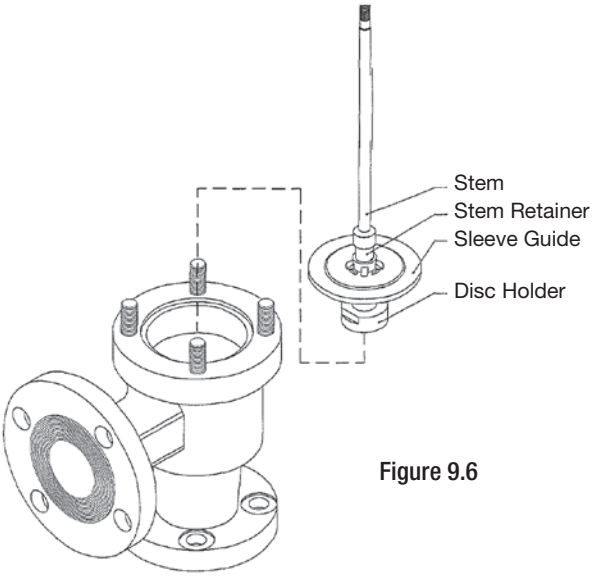

Figure 9.6

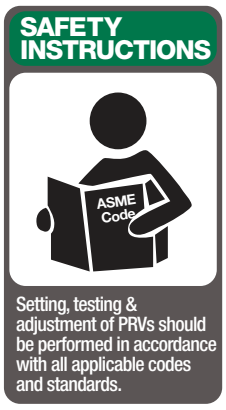
17. Place the upper **Spring Button** [17] on the **Spring** [20].
18. Thread the **Pipe Plug** [27] into the **Bonnet** [2]. Skip this step for Bellows Construction.
19. Place the **Bonnet** [2] onto the **Body** [1], making sure to align the **Pipe Plug** [27] to the position indicated in disassembly notes. Normal convention is to position the **Pipe Plug** [27] opposite of the valve outlet.
20. Thread the Hex Nuts (Body) onto Body Studs and tighten. Ensure that the **Body Gasket** [22] and **Bonnet Gasket** [23] are properly positioned in the respective counter-bores.
21. Thread the **Jam Nut (SAS)** [11] onto the **Spring Adjusting Screw (SAS)** [10].
22. Thread the **SAS** [10] into the **Bonnet** [2] to the position indicated in disassembly notes.
23. Valve should now be ready for testing, final assembly and sealing.
24. Following testing, place the **Cap Gasket** [21] on the **Bonnet** [2].
25. Thread the **Cap** [3] onto the **Bonnet** [2] and wire-seal.

NOTES:

1. **For Balanseal Bellows construction** please see Appendix B for assembly instructions.
2. **For O-Ring seat construction** please see Appendix C for assembly instructions.
3. **For open lever, packed lever and bolted cap construction** please see Appendix D for assembly Instructions.

10. Setting, Testing and Adjustments

Equipment



Air testing is the usual method of testing and setting pressure relief valves; however, valves should be set and tested using the approved media according to applicable codes and standards. A pressure source supplies air to a test drum usually 1-1/2 cubic feet internal volume. The air pressure to the test drum is controlled by a quick opening valve (approximately 1 inch). The valve being tested is mounted directly on the test drum without restrictions. If considerable numbers·of valves are tested, it is advisable to provide an air receiver between the compressor and the quick opening valve. This arrangement allows a small-volume high-pressure compressor to store air during off-hours.

Adjustments & Performance

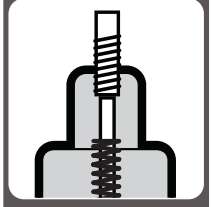
The use of the correct spring is a matter of critical importance. Attempting to employ a spring below its rated pressure range may result in a loss of lift with resulting loss of capacity and a generally sluggish valve action. Using a spring above or below its rated temperature range may cause a change in spring characteristics and possibly failure of the spring itself. Before changing the set pressure of any valve verify that the new pressure is within the range of the spring and valve construction. When raising the set pressure, check the applicable design code and the design pressure of the protected equipment to ensure compliance with equipment design and local requirements. Before reducing the set pressure, make certain that the capacity at the reduced pressure is sufficient for the protection of your equipment. Valves which are properly installed on steam, gas, or vapor services will relieve with a pronounced pop when opening. After the excess pressure has been relieved, the valve will generally reseat at approximately 5% to 7% below the set pressure. Actual blowdown will vary with each valve and installation. There is generally no distinct pop with liquid service relief valves as the opening will generally be proportional to the rise in pressure. It is important for blowdown rings to be adjusted carefully and accurately in accordance with the table values.

Procedure

To properly test a valve, the test drum pressure is brought up to about 90% of the set pressure of the valve. The quick opening valve is now opened sufficiently to cause the test drum pressure to continue to increase 2 psi/sec until the valve pops. A test gauge connected to the test drum in a static pressure zone will indicate the pressure the valve pops. Further spring setting adjustments may be necessary to achieve the desired set pressure of the valve. The tightness of a pressure relief valve on gas or vapor service is closely connected with the operation of the valve i.e. unless a valve opens and closes sharply, it may leak. The action of such a valve depends upon the expansive and reactive forces of the flowing medium (gas or vapor only) which in turn depends upon the location of the blowdown ring. Since the capacity of the test stand is considerably less than the actual valve capacity, it is essential that the blowdown ring be adjusted for good test stand operation. The lowest ring position that can be tolerated for a given size test drum depends upon the valve size and its set pressure relative to the test drum size. Raising the nozzle ring to within two notches from touching the disc holder will obtain the maximum reaction from the smallest amount of the test fluid. However, this position may produce excessive impact and seat damage to small valves set at high pressures. Using a test gag while testing valves can reduce the damage to the seating surfaces.

Adjusting Valve to Required Set Pressure

After the valve has been reconditioned and reassembled minus the cap and/or lever assembly, it is ready for a final spring adjustment to the required set pressure. If a new set pressure is required, the limits for adjustment of the spring must be observed. It may be necessary to provide a different spring. After the jam nut is tightened, the valve should be popped at least once more to prove the accuracy of the setting.



Air Test Stand Settings

For spring adjustment or checking set point on air test stands, raise the ring to a position 2 notches down from contact with the disc holder. Return ring to tabulated field setting or setting established through in-place testing before installation. Be sure to include temperature compensation of set pressure where applicable.

Liquid Service

Liquid service valves must be set on water with set pressure indicated as the first steady stream of water perpendicular to the outlet of the valve. Intermittent opening and closing indicates leakage. The reduction in inlet pressure required to reseat the valve depends on the rate of flow and operator manipulation. Set the blow down ring to the position indicated in Table 10.3. Do not attempt to adjust the blow down ring without gagging the valve first (or reducing inlet pressure to zero). Remove the gag. When the valve is first mounted there will be some air under the disc of the valve. This may cause the valve to pop open suddenly. To remove the air, lift up on the stem to let the air slowly seep out, if possible. Pressure may need to be added under the valve to assist in lifting the stem. Next, raise the pressure to the desired set point. When the pressure is within 90% of the set pressure, raise the pressure at a rate of 1 psig per 2 seconds. Adjust the spring adjusting screw until the desired set pressure is reached. We define set pressure for a liquid valve as the first continuous flow which is flowing 90 degrees from the outlet. Confirm that you have the set pressure correct by raising the pressure to where the first steady stream is evident. Then, lower the pressure until the valve re-seats. Repeat this procedure until the valve shows a consistent opening pressure.

NOTICE

When making the adjustments under pressure, be sure the valve is lightly gagged to avoid accidental popping. The gag screw must be removed immediately after use. Failure to do so will render the valve inoperable.

Securing The Blowdown Ring

The adjusted position of the ring is maintained by a blow down ring lock screw which threads into the valve body from the outside and engages notches (like gear teeth) on the outside diameter of the blowdown ring. To make an adjustment, loosen and remove the blow down ring lock screw assembly. Insert a screw driver and rotate the nearest notch toward the left to lower the ring or toward the right to raise it, counting the notches as they are moved. Reinstall the lock screw assembly, ensuring that it intercepts a notch without exerting side-pressure on the ring.

Seat Tightness Testing (Figure 10.1)

After the valve is satisfactorily checked for set pressure, it is necessary to check the valve for seat leakage. It is important to minimize leakage from pressure relief valves. Excessive leakage could lead to fouled and inoperable valves, serious product loss and could also be hazardous to personnel and equipment. The valve can be tested for tightness on the test stand by increasing the pressure on the valve to 90 percent or more of the set pressure and observing the discharge side of the valve for evidence of leakage. Methods of determining leakage are covered by applicable standards and specific user requirements.

API Standard 527 is a widely accepted standard for the procedure and acceptance criteria for assessing the seat tightness of pressure relief valves. The user should be familiar with this standard, in addition to any information presented therein. The following seat tightness methods and requirements are in general compliance with API Standard 527.

Air Testing

All openings from the secondary pressure zone shall be closed before counting the bubble rate. This includes such items as caps, drain holes, vents and outlets. A soap solution or equivalent test shall be applied to secondary joints to detect escape of air other than that being measured. Seat tightness tests are normally conducted with pressure at the pressure relief valve inlet held at 90 percent of the set pressure immediately after popping. For valves set at 50 psig or below, the pressure shall be held a 5 psig below the set pressure immediately after popping. Before starting the bubble count, the test pressure shall be applied for a minimum of: 1 minute for valves of inlet sizes 2 inches and smaller; 2 minutes for sizes 2-1/2, 3, and 4 inches; 5 minutes for sizes 6 inches and larger.

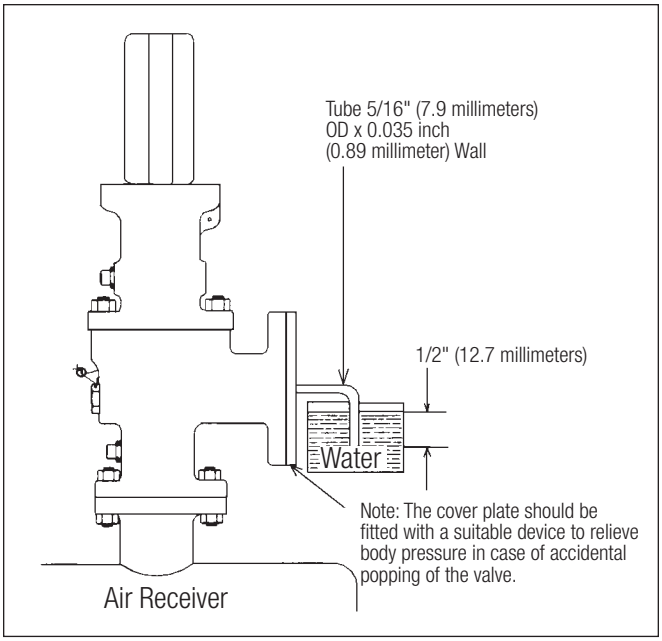


Figure 10.1

Air at ambient temperature shall be used as the pressure medium. The valve shall be observed for leakage for at least 1 minute. The leakage rate in bubbles per minutes shall not exceed the numbers listed in Table 10.1. For an 0-ring seated valve, there shall be no leakage for 1 minute (Zero bubbles per minute @ 95% of set pressure). (Figure 10.1)

Maximum Seat Leakage Rates for Metal-Seated Pressure Relief Valves

Set Pressure psig	Leakage Rate (Bubbles per Minute)	
	F Orifice and Smaller	G Orifice and Larger
15-1000	40	20
1500	60	30
2000	80	40
2500	100	50
3000	100	60
4000	100	80
5000	100	100
6000	100	100

Table 10.1

Steam Testing

Steam service pressure relief valves which are set and adjusted on steam shall be leak-tested on steam visually using a black background. There shall be no visible leakage from the valve outlet when the inlet pressure is held at 90% of the set pressure after popping and reseating. For set pressure below 50 psig this test shall be conducted at 5 psig below set pressure. The valve shall be observed for leakage for at least 1 minute. This criteria applies to both metal and o-ring seated valves.

Liquid Testing

Liquid service pressure relief valves are set and adjusted on water shall be leak-tested on water at near ambient conditions. Before starting the seat tightness test, the set pressure shall be verified, and the outlet body bowl shall be filled with water, which shall be allowed to stabilize with no visible flow from the valve outlet. The inlet pressure shall be increased to the test pressure. The valve shall be observed for 1 minute at the test pressure. For valves set at 50 psig or below, the pressure shall be held at 5 psig below the set pressure. Above 50 psig set pressure hold the pressure at 90% of the set pressure.

Blow Down Ring Settings: Air, Gas, and Vapor Applications

Orifice	Set Pressure Range, psig								
	15 - 100	101 - 200	201 - 300	301 - 400	401 - 500	501 - 600	601 - 800	801 - 1000	1001 & Up

Table 10.2

Note 1: Use the second row only for “D” & “E” orifice valves purchased before July 1, 1993

For both metal and O-Ring seated valves in liquid service, Farris' standard acceptance criteria is no visible leakage at 90% of set pressure for valves with a set pressure of 50 psig and higher. For valves with a set pressure below 50 psig, the test is performed at a 5 psig differential. API Standard 527, Seat Tightness of Pressure Relief Valves, does allow for a more liberal leakage acceptance criteria of 10 cubic centimeters per hour per inch of inlet size. Ultimately, the acceptance criteria selected and the amount of leakage that can be tolerated is the responsibility of the end user based on his experience with the specific application.

Blowdown Ring Setting

Tables 10.2 and 10.3 give blow down ring settings in the number of notches down from disc holder contact. The higher the ring, the sharper the pop and longer the blowdown. The lower the ring, the poorer the pop, the shorter the blowdown.

The 2600L series is now ASME Code Section VIII Certified for use in air, steam and vapor service. Regardless of the service, 2600L Series valves should be adjusted using the liquid service blowdown ring settings in Table 10.3.

Liquid Service Applications

Orifice	Notches
D/E	2
F	3
G/H/J	4
K/L	8
M/N/P	12
Q/R/T/U	20

Table 10.3

Field Settings

The above settings are final average field settings for good performance under actual operating conditions on the installation. Use recommended number of notches, or maximum adjustment possible if less than table. Finer adjustments may be desirable or necessary because of individual piping and service differences. On applications where the valve will operate at substantially reduced flow, fewer notches may help eliminate chatter and ensure seat tightness.

Compensation for Temperature

Any increase in temperature causes a reduction in set pressure of a safety-relief valve. The primary factors are the linear expansion of the body and top works, which reduces the spring loading, and the direct effect of temperature on the spring itself.

It is customary to compensate for this effect by increasing the setting when a valve is set at ambient conditions on a test stand and the valve is intended for a higher operating temperature in service. Although the adjustment is approximate and may be outweighed by other differences caused by variations in media and blowdown ring adjustments, compensation for temperature as an independent variable improves the accuracy of the setting. It is not recommended to reduce a spring setting for valves intended for sub-zero service. (Table 10.4)

CDTP Temperature Compensation

Normal Operating Temperature		% Increase in Set Pressure at Atmospheric Temp.
°F	°C	
-400 to 300	-240 to 149	none
301 to 600	150 to 316	1%
601 to 900	317 to 482	2%
901 to 1200	483 to 649	3%

Table 10.4

COLD DIFFERENTIAL TEST PRESSURE (CDTP) is the inlet pressure at which the valve is adjusted to open on a test stand at ambient temperature conditions, discharging to atmosphere. Computation includes compensation for constant back pressure (if required) and inlet operation temperature. Cold Differential Test Pressure is the sum of the Spring Selection and the Increase in Setting to compensate for temperature. The abbreviation is Cold Set. (Table 10.4)

Compensation for Backpressure

Back Pressure is the pressure existing at the valve outlet and in the valve outlet and in the downstream portion of the valve body. It may be superimposed, built-up, constant, or variable. The spring setting should be compensated for constant and superimposed back pressure, except for BalanSeal valves. For these type valves, variable back pressure is not compensated for, but the maximum pressure limit of the bellows is stamped on BalanSeal tag (Figure 1.1).

Operating Differentials

The variety of service conditions which a pressure relief valve is subjected to precludes a rigid set of rules. Operating difficulties can be minimized by providing as much differential as possible for known conditions on a particular application. Table 10.5 lists the suggested minimum differentials.

Final Notes

Once your valve has been assembled and tested make sure that you have completed all necessary records before placing it back in service. These records are important for the effective future use of the valve. They will provide some guidance as to when to retire valves and replace components as well as providing the historical record of the conditions and services under which the valve operated. A sample maintenance record appears in Appendix F which can be photocopied and used for this purpose.

The valve should be properly installed in service or prepared for storage. If the valve is to be stored the inlet and outlet of the valve should be covered to protect against any foreign matter entering the valve.

Set Pressure Tolerance And Operating Differentials: Gases, Vapors, and Liquids

	Set Pressure psig	Set Pressure Tolerance (+) or (-)	Minimum Differential Suggested (Gases & Vapors)	Minimum Differential Suggested (Liquids)
Metal Seat Soft Seat	15 to 70	2 psi	5 psi	5 psi
Metal Seat Soft Seat	71 to 1000	3%	10%	10%
Metal Seat Soft Seat	1001 to 6000	3%	10%	10%

Table 10.5

11. Troubleshooting

Chatter

The valve is oversized for installation.
If the inlet capacity is less than 25% of the valve capacity there will be a tendency for the valve to chatter.

The inlet piping is of excessive length or the inlet pipe diameter is less than the inlet size of the valve.
Design inlet piping systems so that the pressure drop to the valve is less than 3%. The inlet pipe diameter should be at least the inlet size of the valve.

The outlet piping is of excessive length or the diameter is less than the valve flange size.
Design outlet piping so that the diameter is at least the outlet size of the valve and that pressure on the outlet does not build up causing the valve to shut.

Incorrect Set Pressure

Misreading the nameplate
Always compensate for backpressure and temperature when bench testing the safety-relief valve by following the Cold Differential Test Pressure.

The blowdown ring position changed
Check that the lock screw stud has engaged between the teeth on the blowdown ring to prevent rotation. This could also cause erratic blowdown characteristics as well as leakage.

Internals are misaligned.
See section on leakage.

Jam nut is loose.
Tighten jam nut.

Rough handling.
A safety-relief valve is a precision instrument and should be handled with care. It is also recommended that the valve be popped once or twice to realign the parts after rough handling.

Pressure surge at inlet.
Sudden impact of a fluid may cause the valve to open prematurely. Pressure build-up should be gradual.

The valve contains a bellows and the bonnet is not vented.
Remove bonnet pipe plug so that the bonnet is exposed to atmospheric pressure.

Leakage

The seats are damaged.
Lap the seats to remove the damage. If the scratches are deep, machining may be required. Remove any foreign particles from the system to prevent scoring the seats.

The system operating pressure is too close to the valve set pressure.
Always have at least 10% (or 5 psig, whichever is greater) differential between operating pressure vs. set pressure for metal seated and soft seated valves. See Table 10.5.

Misaligned lifting gear.
Adjust the stem test washer so that there is 1/8 inch clearance between either the cam or lever and the stem test washer. See Appendix D.

Horizontal mounting.
Safety-relief valves must be mounted with the stem in the vertical plane. If mounted horizontally the valve will experience excessive friction on the guides and will not align properly.

Lock screw stud not adjusted properly.
Adjust the length of the lock screw stud so that it does not press into the blowdown ring causing misalignment.

Misaligned internals.
Disassemble valve and check all universal ball joints, flatness of disc and nozzle seat and repair or replace.

Other.
Check for bent stem, springs with uneven ends or out of alignment. A common cause of bent stems is overgagging. Test gags are designed to be finger tightened only.

Blowdown

Blowdown is excessive/the valve is hanging up
Lower the blowdown ring until the desired blowdown is achieved. Also check for dirt or other foreign material in the seating area or on the guiding surfaces.

Blowdown is too short.
Raise the blowdown ring to lengthen the desired blowdown.

Appendix A: Valve Terminology

Safety Valve - An automatic pressure relieving device actuated by the static pressure upstream of the valve, and characterized by rapid full opening or pop action. It is used for steam, gas, or vapor service.

Relief Valve - An automatic pressure relieving device actuated by the static pressure upstream of the valve which opens in proportion to the increase in pressure over the opening pressure. It is used primarily for liquid service.

Safety Relief Valve - An automatic pressure actuated relieving device Suitable for use as either a safety or relief valve, depending on application.

Pressure Relief Valve - A pressure relief valve is a pressure relief device which is designed to reclose and prevent the further flow of fluid after normal conditions have been restored.

Set Pressure - Set pressure, in pounds per square inch gauge, is the inlet pressure at which the pressure relief valve is adjusted to open under service conditions. In a pressure or safety relief valve in gas, vapor, or steam service, the set pressure is the inlet pressure at which the valve starts to discharge under service conditions.

Differential Set Pressure - The pressure differential in pounds per square inch between the set pressure and the constant superimposed back pressure. It is applicable only when a conventional type safety relief valve is being used in service against constant superimposed back pressure.

Cold Differential Test Pressure - Cold differential test pressure, in pounds per square inch gauge, is the inlet static pressure at which the pressure relief valve is adjusted to open on the test stand. This pressure includes the corrections for service conditions of back pressure or temperature, or both.

Operating Pressure - The operating pressure of a vessel is the pressure, in pounds per square inch gauge, to which the vessel is usually subjected in service. A vessel is usually designed for a maximum allowable working pressure, in pounds per square inch gauge, which will provide a suitable margin above the operating pressure in order to prevent any undesirable operation of the relief device. (It is suggested that this margin be as great as possible consistent with economical vessel and other equipment design, system operation and the performance characteristics of the pressure relieving device.)

Maximum Allowable Working Pressure - Maximum allowable working pressure is the maximum gauge pressure permissible at the top of a completed vessel in its operating position for a designated temperature. This pressure is based on calculations for each element in a vessel using nominal thicknesses, exclusive of allowances for corrosion and thickness required for loadings other than pressure. It is the basis for the pressure setting of the pressure-relieving devices protecting the vessel. The design pressure may be used in place of the maximum allowable working pressure in cases where calculations are not made to determine the value of the latter.

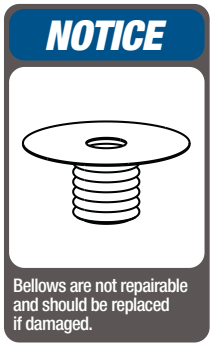
Overpressure - Overpressure is a pressure increase over the set pressure of a pressure relief valve, usually expressed as a percentage of set pressure.

Accumulation - Accumulation is the pressure increase over the maximum allowable working pressure of the vessel during discharge through the pressure relief valve, expressed as a percent of that pressure or in pounds per square inch.

Blowdown - Blowdown is the difference between actual popping pressure of a pressure relief valve and actual reseating pressure expressed as a percentage of set pressure or in pressure units.

Lift - Lift is the actual travel of the disk away from closed position when a valve is relieving.

Back Pressure - Back pressure is the static pressure existing at the outlet of a pressure relief device due to pressure in the discharge system.



Superimposed Back Pressure - Superimposed back pressure is the static pressure existing at the outlet of a pressure relief device at the time the device is required to operate. It is the result of pressure in the discharge system from other sources when the valve is closed. Superimposed back pressure can be constant, variable or both:

- **Constant Superimposed Back Pressure** - Back pressure which does not change appreciably under any condition of operation whether the pressure relief valve is closed or open.
- **Variable Superimposed Back Pressure** - The pressure existing at the outlet of a pressure relief device, which does not remain constant when the pressure relief valve is closed.

Built-Up Back Pressure - Built-up back pressure is pressure existing at the outlet of a pressure relief device occasioned by the flow through that particular device into a discharging system.

Appendix B: Bellows Construction

Bellows require very thin materials to provide the required flexibility. This results in a delicate assembly which should be carefully handled. Do not attempt to repair a bellows assembly. Any pitting or surface corrosion are sure signs of limited service life even though the bellows may be pressure tight. All bellows assemblies should be pressure tested in accordance with Figure B.1. Any leakage should be cause for bellows replacement. For BalanSeal bellows equipped valves use the assembly fixture shown in Figure B.2. Exercise care in handling the internal assembly when equipped with a bellows as any damage to the bellows in the form of a nick or dent will render the bellows unfit for service. Bellows are not repairable.

1. Place bellows/stem retainer/disc holder assembly into bellows leak test fixture with the bellows flange at the base.
2. Seal the flange of the bellows to the base of the bellows test fixture as illustrated in Figure B.1.
3. Compress the bellows approximately 1/8 inch with a securing bar so that the bellows does not elongate when pressure is applied as in Figure B.1.
4. Fill the disc holder with water. Omit this step for D & E Balanseal designs as these designs have a one piece disc holder/stem retainer.
5. Apply 30 psig pressure to the back side of the bellows.
6. Apply soapy water to bellows exterior to check for bellows integrity.
7. If bubbles appear on bellows exterior there are pin holes or a tear. Replace bellows and repeat the procedure.
8. Check to be sure the bellows/disc holder connection is leak tight. If water in disc holder bubbles or the connection bubbles, tighten the connection or replace gasket.
9. Vent pressure.
10. Release bellows assembly.
11. Air dry bellows assembly to remove soapy water.

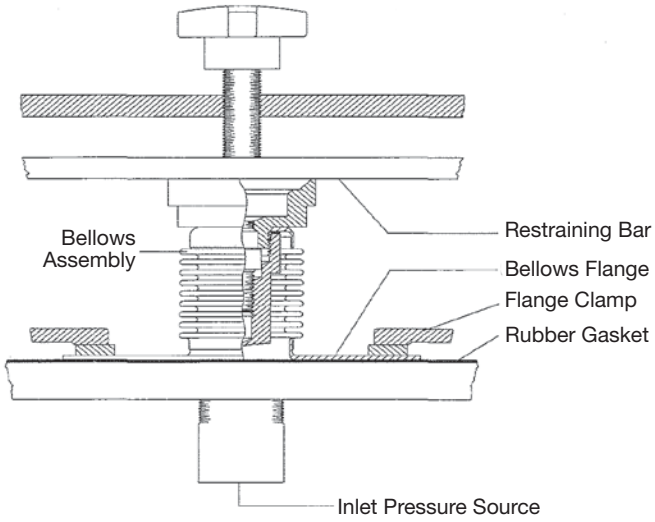


Figure B.1 Bellows Assembly Leak Test

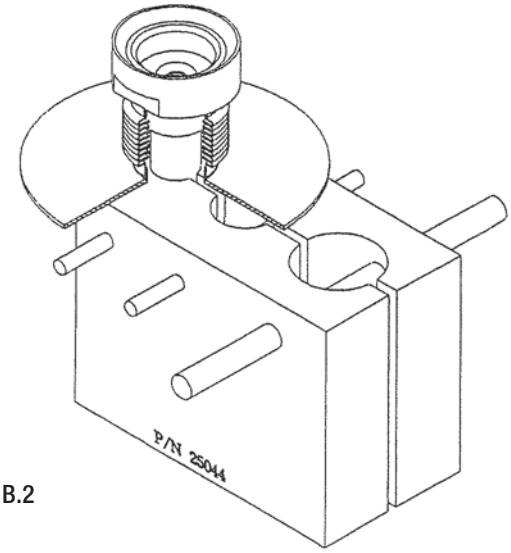

Figure B.2

BalanSeal® Bellows Construction Assembly/Disassembly Instructions

The following instructions are assembly instructions. For disassembly, reverse the order. Parts identification may be found below. Follow the same procedures as for conventional type valves except as follows:

For D and E orifice valves only (Refer to B.3 below):

1. Place the **Bellows Gasket** [16] on **Disc Holder** [6].
2. Thread the **Bellows** [15] onto the **Disc Holder** [6] and securely tighten.
3. Do not thread **Pipe Plug (Bonnet)** into **Bonnet** [2]. **Bonnet** [2] must be vented In accordance with ASME Code.

For all other orifices (Refer to B.4 below):

1. Place the **Bellows Gasket** [16] on the **Stem Retainer** [14].
2. Place the **Bellows** [15] on the **Stem Retainer** [14].
3. Thread the **Disc Holder** [6] to the **Stem Retainer** [14] using the special assembly block.
4. Thread the **Lock Screw** [19] counter clockwise until contact is made with the **Disc Holder** [6]. See **Figure B.1** for bellows leak test.
5. Do not thread **Pipe Plug (Bonnet)** into **Bonnet** [2]. **Bonnet** [2] must be vented In accordance with ASME Code.

Note: For F - K orifices, O-ring seat construction only, an additional **Disc Holder Lock Screw Gasket** must be placed between the **Stem Retainer** [14] and the **Disc Holder** [6].

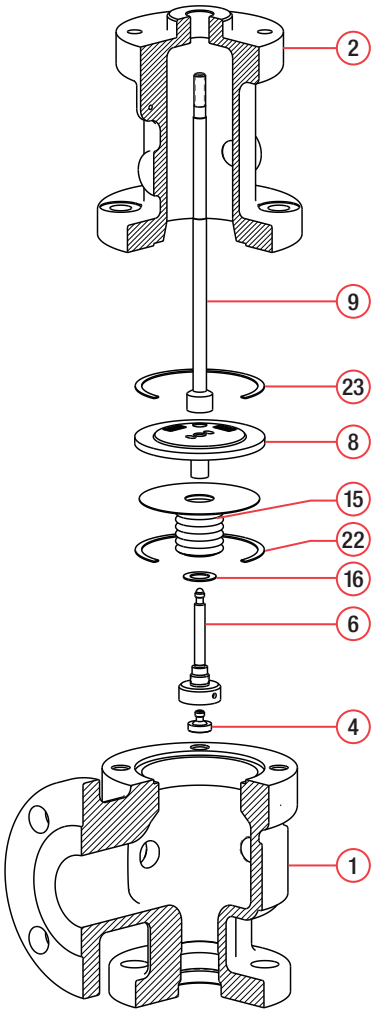

Figure B.3

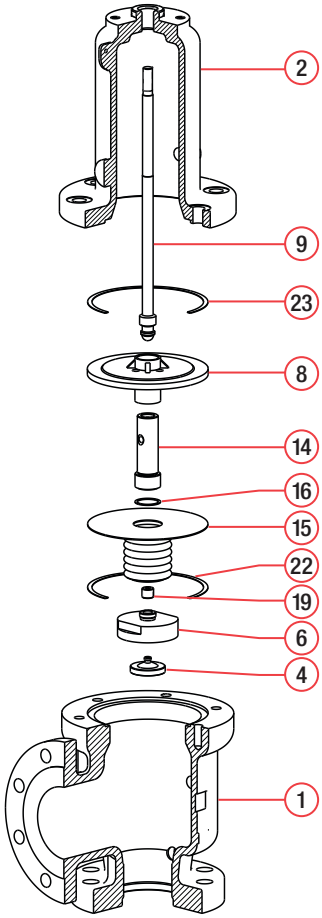

Figure B.4

Appendix C: O-Ring Construction

Due to corrosion, metal-to-metal seats can eventually leak. With the proper selection of the Farris O-ring seat pressure seal, seat tightness can be improved and maintained. Because O-rings are elastomeric, they should be handled carefully. Typically, O-rings should be replaced during your normal maintenance interval. O-rings are not repairable.

Standard seat tightness for O-ring seated valves is no leakage at 90% of set pressure for both conventional and bellows valves following Farris standard seat tightness test procedure. At set pressures of 50 psig and below, leakage test shall be made at 5 psig below set pressure.

The O-ring seat seal option is available for 2600/2600L/2600S Series valves in both conventional and bellows construction. Farris Engineering has two different O-ring designs which depend on the orifice of the pressure relief valve.

NOTICE

O-rings are not repairable and should be replaced if worn or damaged.

General Notes:
1. Viton and Kalrez are registered trademarks of DuPont Performance Elastomers. We reserve the right to substitute comparable fluorocarbon materials.
2. PTFE seat seals available on an application basis. Consult the factory

O-Ring Seat Construction Assembly/Disassembly Instructions

The following instructions are assembly instructions. For disassembly, reverse the order. Parts identification can be found on page 31. Follow the same procedures as for conventional type valves except as follows:

To connect the **Disc Holder** to the **Stem Retainer** for O-ring valves, use the allen key sizes found in Table C.1

Allen Key Sizes

Disc Holder Lock Screw	
Orifices	**Allen Key Size**
D thru K	1/8"
L thru U	See Table 6.1

Table C.1

For D and E orifice (Bellows Construction only)(See Figure C.1):
1. Place the **O-ring** in the **Disc Holder** groove.
2. Thread the **Disc** into the **Disc Holder/Stem Retainer**.

For orifices D and E (Conventional) through K only (See Figure C.1):
1. Place the **O-ring** in the **Disc Holder** groove.
2. Place the **Disc** into the **Disc Holder**.
3. Thread the **Flat Head Machine Screw** through the **Disc** into the **Disc Holder**.

For orifices L through U only (See Figure C.2)
1. Place **Disc** in a vice with soft jaws or in a 3-jaw chuck. Be careful not to hold too tight as the **Disc** can be damaged.
2. Place the **O-ring** into the **Disc** groove.
3. Place the **O-ring Retainer** on the **Disc**.
4. Thread the **Flat Head Machine Screws** through the **O-ring Retainer** into the **Disc**.
5. Thread the **Jack Screw Plug** into the **O-ring Retainer**.
6. Thread the **Disc** into the **Disc Holder** (ensure the **Disc** is free floating).

Appendix D: Cap Construction

Section VIII of the ASME Code requires the use of a lifting device on all steam, air and hot water (over 140°F/60°C) applications. Packed levers should be used on all liquid applications or where cap tightness is a requirement. Levers should be inspected for proper operation and parts replaced as needed.

Packed Levers

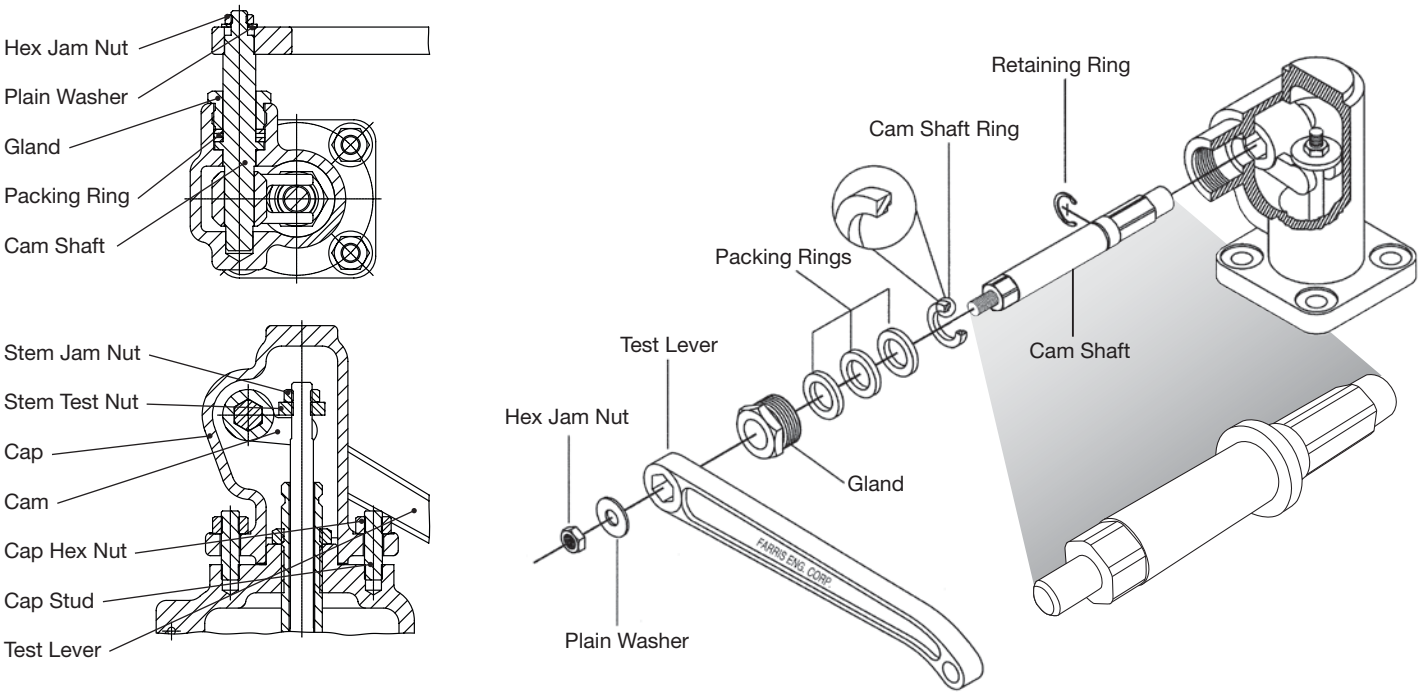

Figure D.1 – Packed Lever Cap Construction
2600 Series, All Sizes

Packed Lever Construction Assembly/Disassembly Instructions

The following instructions are assembly instructions. For disassembly, reverse the order. Parts identification may be found above. Assembly procedures for the balance of valve is identical for all cap design options: plain cap, open lever, bolted cap and packed lever.

1. Thread the **Stem Test Nut** onto the **Stem**.
2. Thread the **Stem Jam Nut** onto the **Stem**.
3. Place the **Cap Gasket** on the **Bonnet**.
4. Place the counter-bored side of the **Retaining Ring** onto the **Cam Shaft**.
5. Place the **Packing Rings** over the **Cam Shaft** and into the **Retaining Ring** cavity.
6. While holding the **Cam** in-place inside the **Cap**, slide the **Cam Shaft** through the hole in the side of the **Cap** and through the **Cam**.
7. Place the **Cap** onto the **Bonnet** ensuring that the cap protrusion is facing the valve outlet.
8. Thread the **Cap Studs** through the **Cap** into the **Bonnet** and tighten.
9. Adjust the **Stem Test Nut** until there is 1/8" clearance between **Stem Test Nut** and the **Cam**.
10. Tighten the **Stem Jam Nut**.
11. Thread the **Gland** into the **Cap**.
12. Place the **Test Lever** on the **Cam Shaft**. **Ensure that the Test Lever Is oriented away from the valve outlet.**
13. Place the **Plain Washer** over the **Cam Shaft**.
14. Thread the **Lever Hex Jam Nut** onto the **Cam Shaft**.

Open Levers

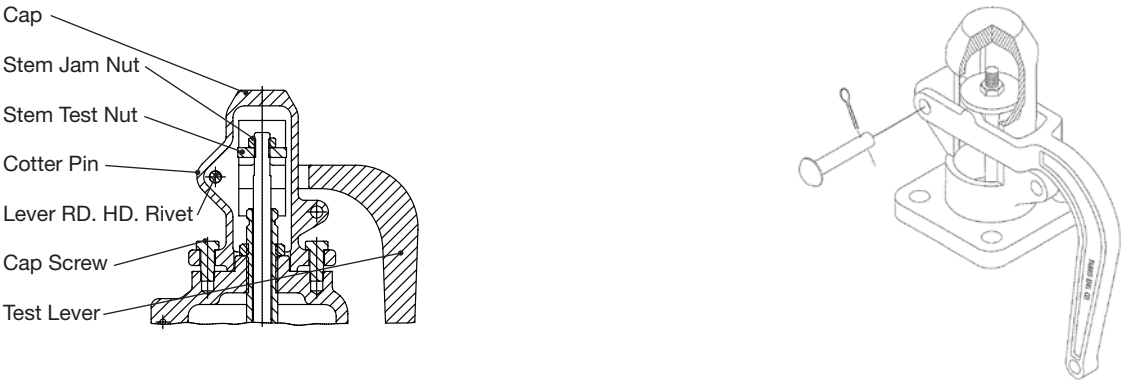

Figure D.2 – Open Lever (Single Acting)
2600 Series, Types 26( )A10, A11, A20, A21, All Sizes Except 8x10

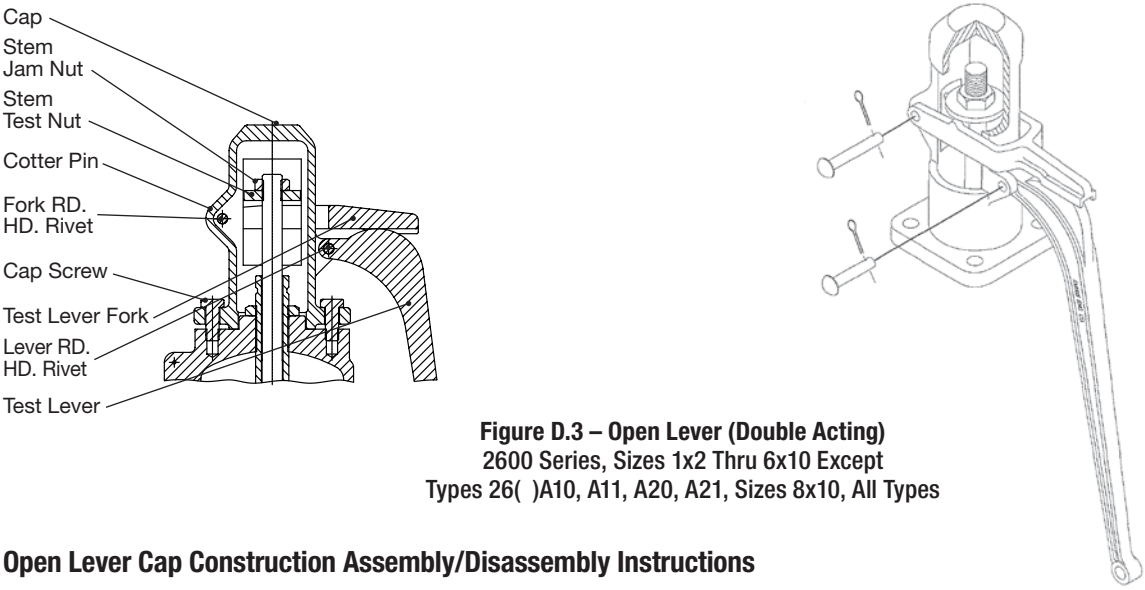

Figure D.3 – Open Lever (Double Acting)
2600 Series, Sizes 1x2 Thru 6x10 Except
Types 26( )A10, A11, A20, A21, Sizes 8x10, All Types

Open Lever Cap Construction Assembly/Disassembly Instructions

The following instructions are assembly instructions. For disassembly, reverse the order. Parts identification may be found above. Assembly procedures for the balance of valve is identical for all cap design options: plain cap, open lever, bolted cap and packed lever.

For single acting lever only:

1. Thread the **Stem Test Nut** onto the **Stem**.
2. Thread the **Stem Jam Nut** onto the **Stem**.
3. Place the **Cap** onto the **Bonnet** ensuring that the cap protrusion is facing the outlet of the valve.
4. Thread the **Cap Studs** through the **Cap** into the **Bonnet** and tighten.
5. Place the **Lever Round Head Rivet** through the **Test Lever** and **Cap** hole and secure with the **Cotter Pin**.
6. Adjust the **Stem Test Nut** so there is 1/8" clearance between the **Test Lever** fulcrum and the **Stem Test Nut**.
7. Tighten the **Stem Jam Nut**.

For double acting lever only:

1. Thread the **Stem Test Nut** onto the **Stem**.
2. Thread the **Stem Jam Nut** onto the **Stem**.
3. Place the **Cap** onto the **Bonnet** ensuring that the cap protrusion is facing the outlet of the valve.
4. Thread the **Cap Studs** through the **Cap** into the **Bonnet** and tighten.
5. Place the **Fork Round Head Rivet** through the **Test Lever Fork** and **Cap** hole and secure with a **Cotter Pin**.
6. Place the **Lever Round Head Rivet** through the **Test Lever** and **Cap** hole and secure with the **Cotter Pin**.
7. Adjust the **Stem Test Nut** so there is 1/8" clearance between the **Test Lever Fork** and the **Stem Test Nut**.
8. Tighten the **Stem Jam Nut**.

General Notes:
1. Z column designates flange class number to be inserted in type number, example: 26D( )( )3 would designate any of the D orifice 2600 designs (conventional or bellows) with a 600# inlet flange.
2. For type 2600 (A10 & A11 Serials) see Figure 2. For type 2600L (A14 & A15 serials) see Figure 3.
3. Does not apply to valve type numbers designated for use at a temperature range of 801 to 1000 F.
4. For serial numbers suffixes; A10/G, A11/G, A14/G, A15/G, please consult factory for critical dimensions.

General Notes:
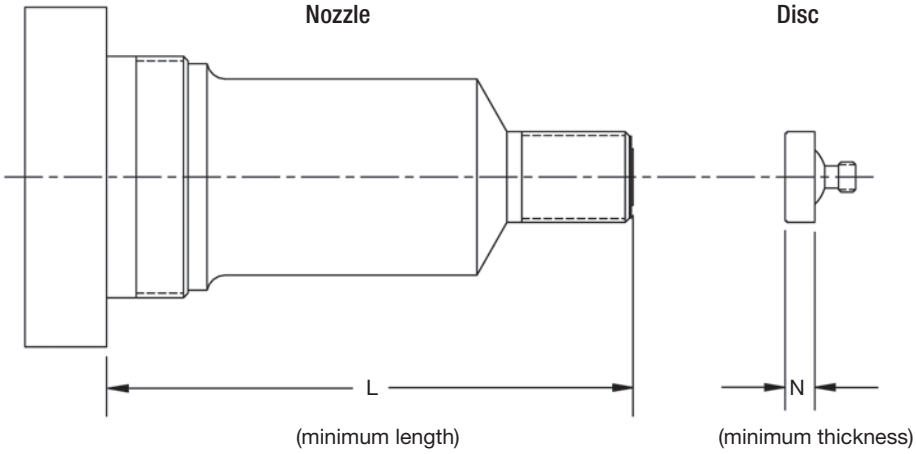
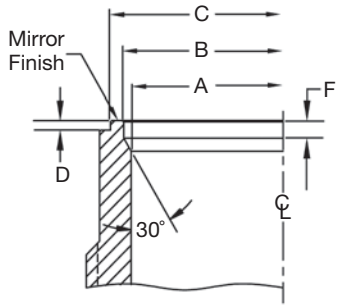
1. Only bellows valves use Disc Figure 2 and the 0.653 inch dimension. Conventional valves use Disc Figure 1.

These dimensions only apply to "D" and "E" orifice valves as follows:

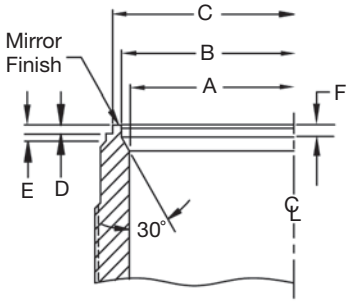


United States
A10 serial numbers below 30000.



A11 serial numbers below 4000.

Canada
A10 & A11 serial numbers C12001 and above.



Metal Seats A10, A11 Interim Critical Dimensions

Refer to Table E.4

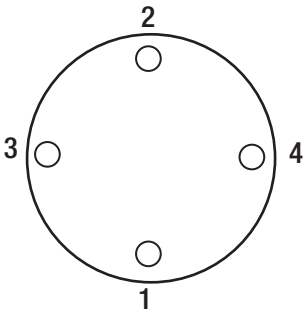
Appendix H: Torque Requirements

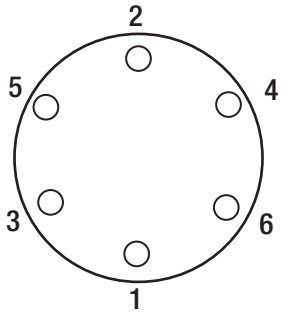
This appendix contains the minimum torquing requirements for body/bonnet and bolted/packed cap for Farris pressure relief valves.

Valve: Body/Bonnet - Bolted/Packed Cap Procedure



(See figures to the right):

1. Valve studs, nuts and bolts shall be visually inspected to ensure they are free of rust, dirt, or physical damage.
2. Install nuts on the studs finger-tight.
3. Tighten the nuts per the sequence shown in the diagram to the right to approximately one-half the torque value shown in Table H.1. Repeat the same sequence of tightening to the torque value shown in Table H.1. Then starting with the Nut Number 1, tighten each nut in order in a clockwise or counterclockwise direction to the value shown in Table H.1. (16 stud pattern, similar to 12 stud pattern).
4. Bolting torque tolerance: ±10%. **Measure torque with a calibrated torque wrench or torque device.**



Torque Values

Stud Thread	Torque (Ft. Lbs.) to Produce Stress in Stud Bolts		
	30 Ksi Stress (B8M, B8MA)	45 Ksi Stress (B7M)	60 Ksi Stress (B7)
	Material Codes 069, 269, D53, D59	Material Codes 235, 551	Material Codes 114
7/16 - 20	20	30	40
1/2 - 13	30	45	60
5/8 - 11	60	90	120
3/4 - 10	100	150	200
7/8 - 9	160	240	320
1 - 8	240	370	500
1 1/8 - 8	355	533	710

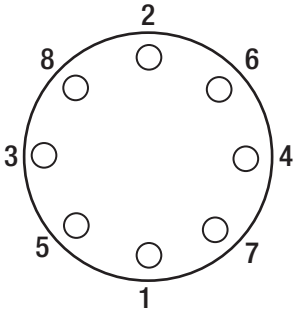


Table H.1

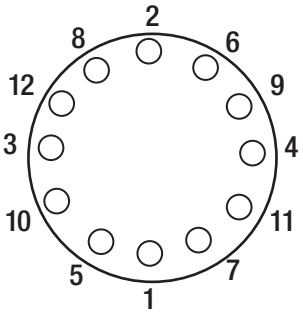

4 Studs

6 Studs

8 Studs

12 Studs

Valve Component Bolting Procedure:

1. **Blow down Ring Lock screw:**
   Lubricate lock screw with Bostik Never-Seez, except in oxygen service where Holocarbon 25-5s or equivalent is used. Torque lock screw to: 80-100 Ft. Lbs.
2. **½"-14 NPT Pipe Plug (P/N: 5098):**
   Lubricate threads with: Bostic Never-Seez. Torque pipe plug to: 18-22 Ft. Lbs.
3. **SAS Jam Nut to Bonnet:**
   Lubricate threads with Bostik Never-Seez, except in oxygen service where Holocarbon 25-5s or equivalent is used. Torque jam nut to: 25-30 Ft. Lbs.

Notes

Farris Aftermarket Services

Real Value Behind Every Valve.

Farris Engineering's aftermarket department and global FAST Center Network adds value to every Farris valve. At Farris, our work is never done. Once we sell you a valve, our FAST Team is there to keep your valves in service and your plant safe. Our FAST Centers are:

Responsive. Farris Engineering and its FAST Centers understand the need to quickly and efficiently respond to customer needs.

- **Global Access** - FAST Centers work with and in our extensive representative network, providing support to all global regions.
- **24/7 Valve Service and Replacement** - FAST Centers offer quick, localized testing and repair of valves, or the prompt installation of new Farris ASME certified valves.
- **Mobile Repair Units** - Available at select FAST Centers.

Experienced. Farris Engineering recognizes the value of having pressure relief valve experts as close to the customer as possible. This is accomplished through comprehensive training offered at the factory or on-site. FAST Center sales personnel and technicians are able to provide valuable experience to their customers.

- **Valve Expertise** - Every FAST Center is technically supported by Farris Engineering, a leader in valve design.
- **Factory Trained Technicians** - FAST technicians go through mandatory training consisting of classroom lecture and hands-on practical instruction on Farris Engineering pressure relief valves, repair procedures and applicable codes and standards. The result is a team of highly skilled technicians capable of handling both routine and complex pressure relief valve requirements around the world.
- **OEM parts** - FAST Centers use only OEM parts, restoring valves to OEM specifications. All valves are assembled and tested to ASME standards.

Dedicated. FAST Centers have committed to large investments in inventory, equipment and certifications to better support the customers in their territory.

- **Local Inventory** - Every FAST Center carries a large inventory of new pressure relief valves and spare parts, backed by a web-based global inventory to draw from.
- **ASME Certification** - FAST Centers carry all the required certifications to assemble, set and test Farris valves.
- **VR Certification** - FAST Centers have VR certification issued by The National Board of Boiler and Pressure Vessel Inspectors to effectively and efficiently repair all pressure relief valves where applicable.

1. Introduction

Numbering System

The chart below illustrates the Farris Series 2700 valve type numbering system. The type number is imprinted on the nameplate of every Farris Series 2700 valve and describes its construction and metallurgy. Valve types with numbers ending in "SP" are special valves. Example: 27DA23-120/SP. Contact the Farris Factory for assistance when replacement parts or maintenance are required on these valves.

O-Ring Design (Optional)

Balanced Design

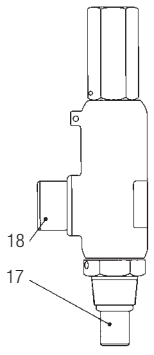

Figure 1.3

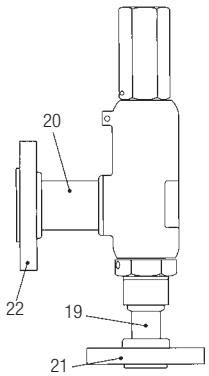

Figure 1.4

UV NB

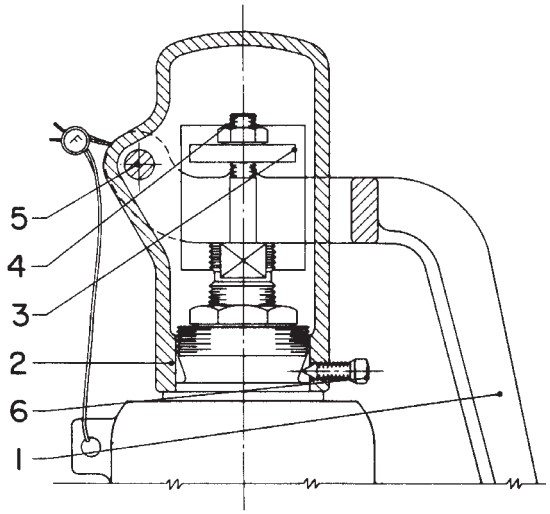
Built in conformance to ASME Code Section VIII, capacity certified by National Board for air, gas, steam and liquid.

General Notes:
1. See 2700 Series Catalog for alternate materials of construction.

2. Disassembly of Valves

Dismantling

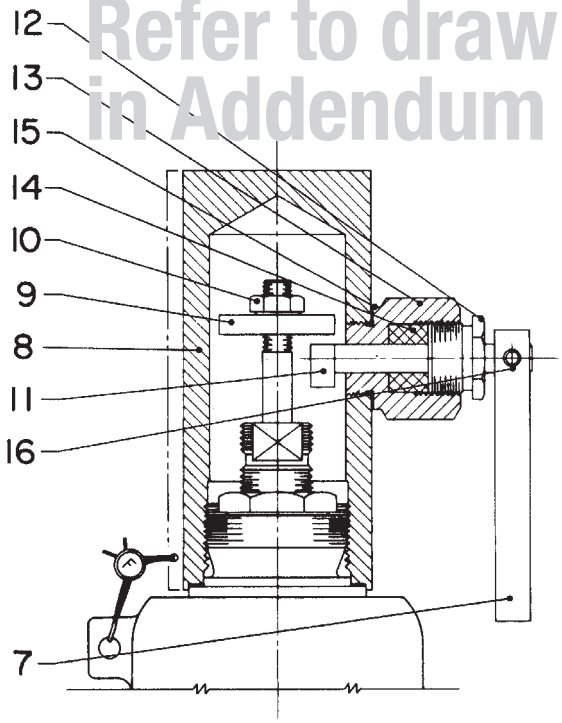
1. Place the valve at a suitable height. The work surface should be clean, and strong enough to handle the weight of the parts and the forces required during disassembly and assembly.
2. Mount valve vertically in a vise using the flats on the valve body.
3. Remove wire seal. Unscrew cap by turning counter-clockwise. (For packed and open lever cap construction, refer to the section on Lifting Lever Assemblies, pg 6.) Remove the cap gasket.
4. Using a smooth jaw wrench, hold the spring adjusting screw and remove the jam nut (spring adjusting screw).
5. Measure the distance from the top of the spring adjusting screw to the top of the bonnet, or count the number of turns of the spring adjusting screw. Use this measurement when reassembling the valve to approximately duplicate the original set pressure.
6. Remove the spring adjusting screw by turning counterclockwise.
7. Thread a pipe into the outlet and turn the bonnet counterclockwise, removing it from the body. Alternatively, the bonnet can be held in a vise and a wrench can be used on the body to loosen it.
8. Lift out the stem with spring and buttons attached. Remove upper button, spring and lower button from stem.
9. Remove the guide gasket.
10. Remove the body and trim assembly from the vise. Place one hand on top of the guide and invert the assembly, allowing the guide which contains the disc holder and disc to drop free of the body. Turn the guide upright and allow the disc holder to slide out of the guide, being careful not to drop either piece. Remove disc from disc holder and body gasket from the body.
11. Clean all parts and threaded surfaces thoroughly. Replace all gaskets.
12. Lap the body seat and disc surfaces. See Section 3 for lapping procedure and Appendix A for critical dimensions.



Accessories

Cap Construction: M70 Open Lever, M40 Packed Lever

Bill of Materials



Cap Construction	Item No.	Part Name	Standard Materials[1]
M70 Open Lever	1	Test Lever	Iron
	2	Cap, Open Lever	Iron
	3	Stem Test Washer	St. St.
	4	Stem Jam Nut	St. St.
	5	Button Head Rivet	Steel
	6	Set Screw	Steel
M40 Packed Lever	7	Test Lever	Steel
	8	Cap, Packed Lever	Steel
	9	Stem Test Washer	St. St.
	10	Stem Jam Nut	St. St.
	11	Cam	St. St.
	12	Gland	St. St.
	13	Gland Nut	St. St.
	14	Packing Ring	Graphite
	15	Gland Nut Gasket	Flexible Graphite
	16	Groove Pin	Steel Plt'd

General Notes:
1. See 2700 Series Catalog for alternate materials of construction.

Open Lever Construction
Figure 1.5

Refer to drawing in Addendum

Packed Lever Construction
Figure 1.6

Lifting Lever Assemblies

A. Open Lifting Lever (Figure 1.5)

1. Remove wire seal and slide out button head rivet, releasing lever from cap. Pull lever free of cap.
2. Remove set screw from base of cap and lift cap off bonnet.
3. Holding the stem with pliers (wrap the jaws to avoid marring), remove stem jam nut and stem test washer.
4. Clean all parts and reassemble in reverse order.

B. Packed Lifting Lever (Figure 1.6)

1. Remove groove pin from lever and slide lever off the cam.
2. Remove gland from gland nut. Unscrew gland nut from cap and remove packing ring and cam. If any signs of leakage exist, replace packing ring.
3. Break wire seal and unscrew cap from bonnet. Holding stem with smooth jaw pliers, remove stem jam nut and stem test washer.
4. Reassemble in reverse order, making sure the cam lobe is pointing down. Stem test washer should be adjusted to ensure the cam will make contact with stem test washer and lift stem when lever is actuated.

3. Refacing and Lapping

Body Refacing (when necessary)

1. True up body by means of an indicator, ensuring that body bore and outside diameter are concentric with each other within 0.002" full indicator reading.
2. Machine a light cut across the seat until damaged areas are removed. The seat should be machined to the smoothest possible finish. Rigidity of the cutting tool is critical.
3. Relap to a mirror finish.
4. Discard and replace the body when the minimum requirement on dimension B, listed in Appendix A, is not met.
5. Bodies on O-ring seat valves do not require refacing. Contact surfaces should be cleaned of any dirt or scale and lightly lapped.

Disc Relapping (metal and Teflon discs)

1. The disc should not be refaced, only relapped.
2. Discard and replace the disc when disc thickness becomes less than dimension A, listed in Appendix A[1].

Lapping Compounds

The three grades of Farris Lapping Compounds are prepared especially for the requirements of pressure relief valves. These are the only compounds recommended for achieving extreme valve tightness.

Farris Lapping Compounds

Part No.	Grade	Finish	Size
18632X1(055)	3F	Roughing	1/2-oz. tube
18633X1(075)	38-500	Medium	1/2-oz. tube
18634X1(105)	38-1200	Final	1/2-oz. tube

Table 1

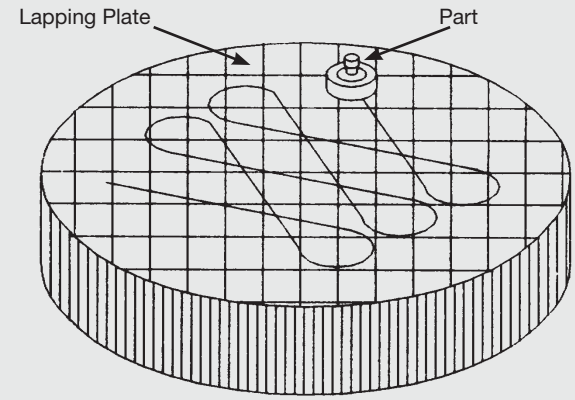


Figure 1.7

Lapping Procedures (manual)

1. Use a cast iron lapping block or Pyrex lapping glass which is known to have a perfectly flat face.

Pyrex Lapping Plates

Part No.	Material Code	Size	Thickness
7688	164	1 1/2"	1/4"
7689	164	2 1/4"	3/8"

2. Select the appropriate lapping compound. When lapping the disc, operate with a light figure eight motion over entire block surface for complete contact. See Figure 1.7. With this motion, the complete surface of the part will be evenly lapped and you will avoid wearing a groove in the block.
3. Lap disc until all blemishes and score marks have been removed. As you execute the figure eight motion, frequently lift disc away from the block to get a fresh bite on the compound. Most important, do not contaminate compounds with dirt. Keep the lid on the lapping compound when not in use. Use only clean applicators to transfer the lapping compound from jar to lapping glass. Store lapping blocks and lapping glass in clean, dust-free area.
4. Follow the same procedure for lapping body seat. Place the body on a table and a lapping block on the body. Be sure that lapping block does not tip over the side of the body (this would cause rounding of the edges). Use a light, rapid figure eight stroke, lifting the block from the body occasionally.
5. Carefully clean compound from all parts. Failure to do this may foul seat and disc surfaces. When reinstalling parts in the valve and assembling disc in the guide, be careful not to scratch either surface.
6. Clean the lapping glass.

General Notes:
1. See Appendix A for critical seat dimensions.

4. Assembly

1. Refer to Figure 1.2 for construction details, and Figures 1.5 and 1.6 for open lever and packed lever cap construction details.
2. Verify that all parts required are grouped for assembly. Visually inspect all parts, paying close attention so that the body and disc seats are clear of imperfections and all parts are clean. Special attention should also be given to the guide, checking for any dirt or scale in exit holes and undercuts, and making sure that guide surface is in good condition.
3. All threaded surfaces should be lubricated with Bostik Never-Seez or equivalent. Sealing surfaces, such as body and cap gasket, should be lightly coated with a pipe thread sealant such as Never Seez® or equivalent.

   Sliding and bearing surfaces such as disc holder/guide and disc-to-disc holder contact surfaces should be left clean and assembled without lubricants.
4. Place disc in disc holder, making sure V-notch is facing the stem radius. Insert assembly into guide. Install body gasket on the body.
5. Hold guide/disc holder assembly horizontally in your left hand and insert body, being careful not to damage disc or body seating surfaces.
6. Mount body/guide assembly vertically in a vise, gripping body securely by the flats. Install guide gasket on top of guide flange.
7. Place spring and spring buttons onto stem assembly and insert into disc holder. Hold in place in vertical position.
8. Place bonnet over assembled parts and screw down handtight onto the body. For C and D orifices, torque the bonnet to the body to 140-160 ft. lbs. For E, F, and G orifices, torque should be 180-200 ft. lbs.
9. Thread the jam nut onto the spring adjusting screw. Place spring adjusting screw over stem and into bonnet. Hand tighten spring adjusting screw until it contacts spring and lightly compresses it. Compress spring to the same point as in disassembly, if same set pressure is required. Install cap gasket.
10. Test the valve according to the procedure described in Section 5. After testing, install the appropriate cap or lever assembly.

5. Setting & Testing

Testing Procedures

Testing consists of adjusting the valve set pressure, performing a seat leakage test and a backpressure test. The set pressure test is always performed first.

Set Pressure Test

1. Set pressure testing must always be performed using the appropriate test fluid shown in Table 2.

Pressure Relief Valve Test Fluids

Service Fluid	Test Fluid
Air, gas & vapor	Air or gas
Steam	Steam*
Liquid	Water

*air may be used for ASME Code Section VIII valves.

Table 2

2. Mount valve on test stand, making a note of set pressure and cold differential test pressure (CDTP). The valve will be set at the CDTP.

All Service Fluids

Operating Temperature	% Increase in Set Pressure at Atmospheric Temperature
-450°F to 300°F (-268 °C to 149 °C)	None
301°F to 600°F (-150 °C to 316 °C)	1%
601°F to 750°F (316 °C to 399 °C)	2%

Table 3

3. Hold the stem tightly and tighten (clockwise) spring adjusting screw to increase the set pressure. Make sure stem does not rotate while tightening the adjusting screw as this can damage seat and disc.
4. Slowly raise test drum pressure and observe the opening (set) pressure. The set pressure on air and steam is the point at which it makes an audible pop. For water, the set pressure is the first continuous flow of liquid that forms a stream approximately 1/16" thick perpendicular to the outlet.
5. If necessary, reduce test drum pressure 25% below the opening pressure and adjust the spring adjusting screw. Repeat until the valve opens at the required pressure, designated as the cold differential test pressure (CDTP). The set pressure tolerance is equal to +/-3% of set pressure.

   ⚠ **Caution:** *Never adjust the spring when the pressure under the valve is near its popping point as the body seat and disc may score and/or gall. Always lower the pressure in the test vessel at least 25% below popping pressure before making adjustments. This will put a loading on the seating surfaces and prevent rotation and damage.*
6. Lock the jam nut in place and pop valve once more to ensure set pressure adjustment was not disturbed.

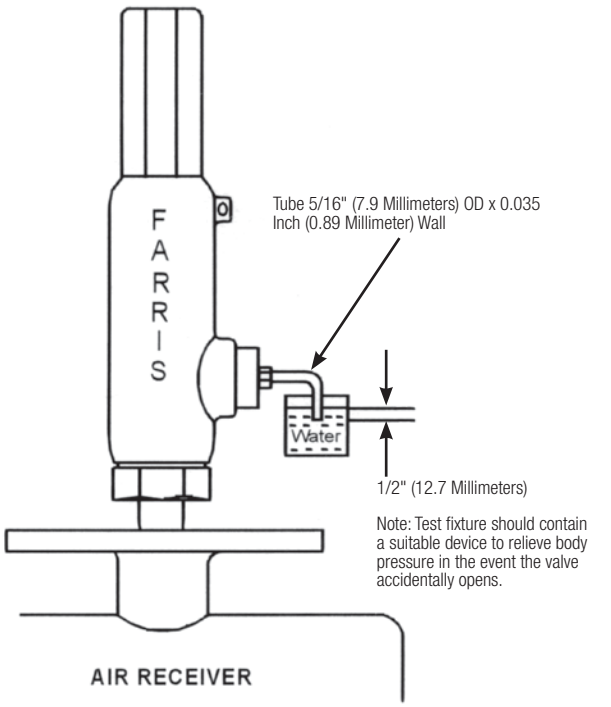

Figure 1.8

Seat Leakage Test

1. After the set pressure test, perform the seat leakage test. With the valve mounted on the test stand, attach a blind test fixture as shown in Figure 1.8 (air, gas & vapor service valves only). For steam and water seat leakage testing, see #4-5.
2. For metal and soft seated valves, the pressure is held at 90% of cold differential test pressure (CDTP) when CDTP is greater than 50 psig. For CDTP of 50 psig and below, the pressure should be held 5 psig below CDTP.
3. Bring the pressure up and hold it for one minute for valves up to 2" inlet size, two minutes for valves from 2 1/2"- 4" inlet size, and five minutes for valves with inlet sizes 6" and larger. Count the number of bubbles for one minute. See Table 3 for acceptance criteria for metal seat valves. For O-ring and soft seat valves, there should be no leakage (zero bubbles per minute).

Seat Leakage Rates for Air, Gas & Vapor Service

Set Pressure		Leakage Rate Bubbles per Minute	Std. Cubic Feet per 24 Hours	Std. Cubic Meters per 24 Hours
(psig)	(barg)			
15-1000	1.03 to 68.9	40	0.60	0.017
1500	103	60	0.90	0.026
2000	138	80	1.20	0.034
6500	448	100	1.50	0.043

Table 4

4. **Steam:** Apply test pressure as per #2 for three minutes before seat tightness test. Observe the valve for leakage for at least one minute. There should be no visible sign of leakage at the valve outlet when viewed against a black background.

   Where the Code allows ASME Section VIII steam valves to be tested on air, seat leakage may be verified using the procedure for air, gas & vapor service as listed in #1-3.
5. **Water:** Liquid valves are tested on water. Apply test pressure as per #2 for two minutes. There should be no visible sign of leakage.

   Note: When performing the seat leakage test on valves with open levers, a plain screwed test cap must be used to prevent venting of the test pressure through the top of the bonnet.

Backpressure Test

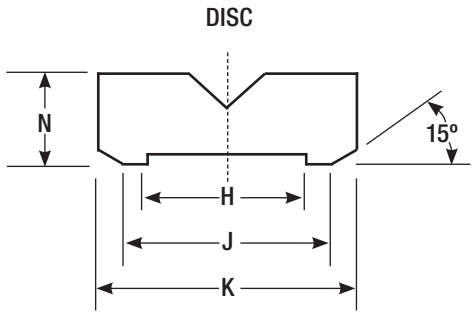
1. The backpressure test applies to all valves designed to discharge to a closed system, including valves with plain caps and packed lever assemblies. Open lever valves and valves with exposed springs (open bonnet) do not require this test.
2. Test the secondary pressure zone of all valves exceeding 1" inlet size with air or other suitable gas at a pressure of at least 30 psi. Use a suitable leak detection solution to verify tightness of all gasket joints and vent/drain plugs.
3. If leakage is detected at any location, rework the valve to eliminate the leak path.

Final Notes

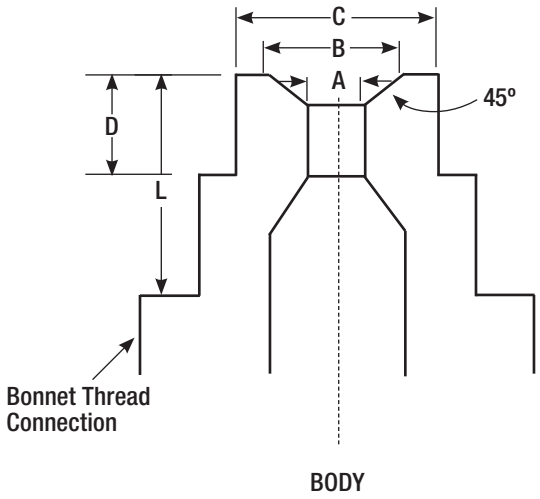
Once your valve has been assembled and tested, make sure you have completed all necessary records before placing it back in service. These records are important for the effective future use of the valve. They provide guidance as to when to retire valves and replace components as well as offer a historical record of the conditions and services under which the valve operated.

The valve should be properly installed in service or prepared for storage. If the valve is to be stored, the inlet and outlet should be covered to protect against any foreign matter entering the valve.

Appendix A



Critical Seat and Disc Dimensions



Use these dimensions when lapping and/or refacing is required. Parts must be replaced if the minimum dimension is reached as indicated in the drawings.

Refer to Addendum

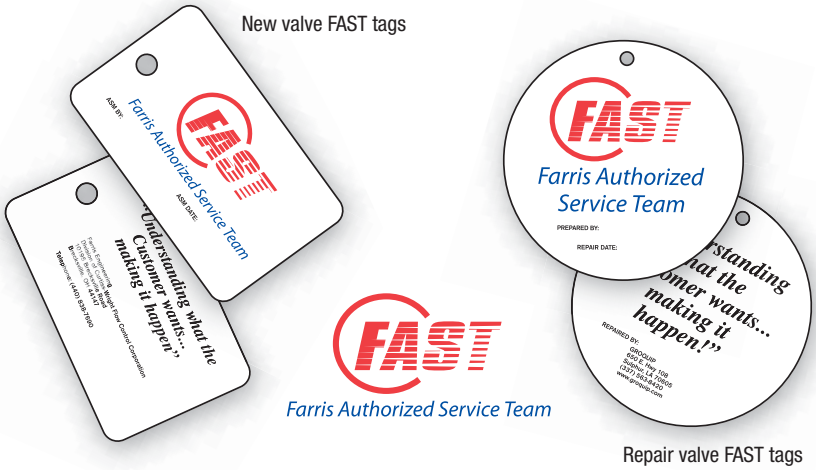
Orifice Letter	Size	Body Dimensions					Disc Dimensions			
		A Min.	B +.002 -.002	C +.000 -.002	D Min.	L Min.	H +.002 -.000	J +.005 -.005	K Min.	N Min.
C	1/2 x 1 3/4 x 1 1 x 1	0.295	0.475	0.561	0.246	0.985	0.503	0.530	0.560	0.344
D	1/2 x 1 3/4 x 1 1 x 1	0.399	0.499	0.561	0.246	0.985	0.503	0.530	0.560	0.344
E	1 x 1 1/2	0.533	0.665	0.746	0.516	0.821	0.685	0.715	0.747	0.363
F	1 1/2 x 2	0.668	0.835	0.935	0.553	0.950	0.865	0.905	0.938	0.734
G	1 1/2 x 2 1/2	0.855	1.070	1.201	0.700	0.910	1.114	1.154	1.204	0.738

General Notes:
1. All dimensions are in inches.
2. Dimensions for body apply to both metal seat and O-ring seat designs.
3. Above dimensions apply to both standard and high pressure versions.

Farris Aftermarket Services

FAST Track Turnaround

Farris Engineering is dedicated to making our FAST Program work for you, which is why we have the FAST Track Center at our headquarters in Brecksville, OH. For urgent service requirements, our FAST Track Center has a large inventory of spare parts, finished valves, and dedicated machining and material resources. Farris can provide quick turnaround on inventory and machined parts for both current and obsolete valve designs.



FAST Centers

Our FAST Centers are a global network of independently owned and operated valve repair facilities offering:

- Total valve replacement, service and repair any hour, any day: 24/7 – 365
- Local pressure relief valve inventories, plus a Web-accessible global inventory
- Factory trained, ASME and VR certified professionals
- Asset management solutions to keep plants safe

Look for the FAST tag, your assurance for quality and safety.

New valve FAST tags

Repair valve FAST tags

In the US or Canada contact 1-877-FARRIS1 or 1-877-327-7471 to find the location of your nearest FAST Center, or for a global listing go to ***http://farris.cwfc.com/Services/spokes/fast.htm***

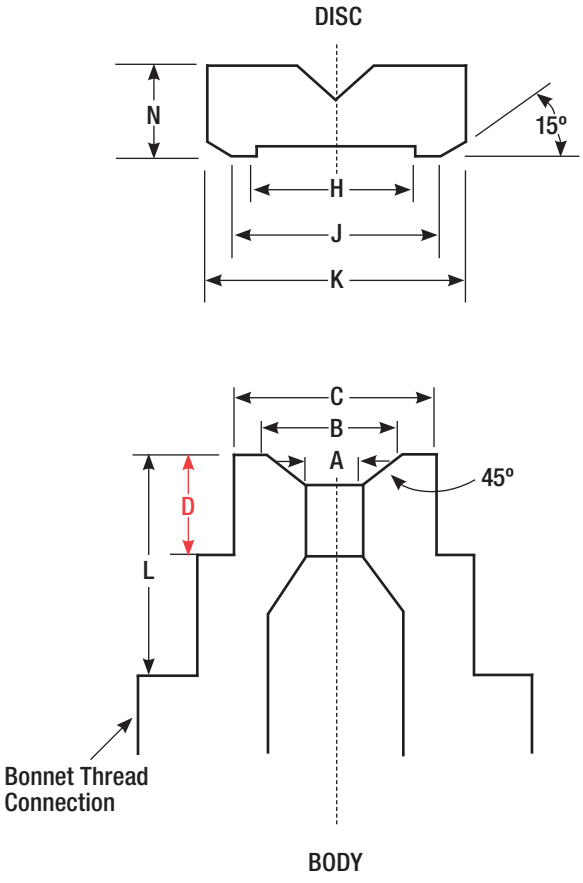
Packed Lever Construction
Figure 1.6

Lifting Lever Assemblies

B. Packed Lifting Lever (Figure 1.6)

1. Remove groove pin from lever and slide lever off the cam.
2. Remove retaining ring from cam.
3. Remove gland from gland nut. Unscrew gland nut from cap and remove packing ring and cam. If any signs of leakage exist, replace packing ring.
4. Break wire seal and unscrew cap from bonnet. Holding stem with smooth jaw pliers, remove stem jam nut and stem test washer.
5. Reassemble in reverse order, making sure the cam lobe is pointing down. Stem test washer should be adjusted to ensure the cam will make contact with stem test washer and lift stem when lever is actuated.



Appendix A correction

Critical Seat and Disc Dimensions

Use these dimensions when lapping and/or refacing is required. Parts must be replaced if the minimum dimension is reached as indicated in the drawings.

Orifice Letter	Size	Body Dimensions					Disc Dimensions			
		A Min.	B +.002 -.002	C +.000 -.002	D Min.	L Min.	H +.002 -.000	J +.005 -.005	K Min.	N Min.
C	1/2 x 1 3/4 x 1 1 x 1	0.295	0.475	0.561	0.246	0.985	0.503	0.530	0.560	0.344
D	1/2 x 1 3/4 x 1 1 x 1	0.399	0.499	0.561	0.246	0.985	0.503	0.530	0.560	0.344
E	1 x 1 1/2	0.533	0.665	0.746	0.516	0.821	0.685	0.715	0.747	0.363
F	1 1/2 x 2	0.668	0.835	0.935	0.553	0.950	0.865	0.905	0.938	0.734
G	1 1/2 x 2 1/2	0.855	1.070	1.201	0.700	0.910	1.114	1.154	1.204	0.738

General Notes:
1. All dimensions are in inches.
2. Dimensions for body apply to both metal seat and O-ring seat designs.
3. Above dimensions apply to both standard and high pressure versions.

General Notes:
1. Blowdown on liquid service may slightly exceed 15% in certain applications.

Teflon is a registered trademark of the DuPont Company.
Monel is a registered trademark of Inco Alloys International Inc.
Hastelloy and Hastelloy C are registered trademarks of Haynes International Inc.

Introduction

Designed to provide customers with the widest selection of sizes, orifices and construction materials, Series 2700 meets the exacting demands of the process industry.

Superior Design

- A single design handles air, steam, vapor and liquid services.
- Maximum interchangeability of parts affords easy maintenance and lower costs.
- Fixed blowdown design simplifies testing and repair. Maximum blowdown of 5% to 15% regardless of service.[1]
- A built-in lift stop ensures stable performance.
- Balanced design in “C” and “D” orifices nullifies the effects of back pressure on set point.

ASME Code Certification

- Manufactured in conformance to Section VIII of the ASME Boiler and Pressure Vessel Code for air, steam, and water service.
- Capacities certified by The National Board of Boiler and Pressure Vessel Inspectors.

Optional O-Ring Seat Design

- O-ring seat design available for maximum seat tightness.
- Teflon® available at higher pressures to provide the same zero bubbles per minute leakage as elastomer O-ring seats.

Comprehensive Product Line

- Set pressures from 15 psig to 6500 psig with orifice areas from 0.068 to 0.573 sq. in.
- Standard valves have MNPT inlet x FNPT outlet. Optional female inlet thread, flanged, socket weld, welding nipple, and sanitary connections available.

Maximum Selection of Materials

- Standard construction includes 316 stainless steel body, trim and spring, with carbon steel bonnet.
- Optional materials include Monel®, Hastelloy C®, and materials suitable for NACE service.

Warranty

All products manufactured by Farris Engineering are warranted free of defects in material and workmanship when used within the range recommended for a period of one year after installation or eighteen months from delivery. When authorized, any defective product may be returned to the factory and if found defective will be repaired or replaced free of charge, solely at the discretion of Farris Engineering, ex-works our factory. No charge for labor or other expense incurred will be allowed, as the liability of Farris Engineering is measured by the refund price of the defective product only. All warranties are based on the product being used within the range recommended and does not cover damages or defects due to normal wear and tear, misuse, alteration or neglect. The purchaser shall determine the suitability of the product for use and assumes all risks and liabilities in connection therewith.

This warranty does not cover the performance of valves tested at site on test equipment that is not to the same technical standard as that used by the manufacturer.

Numbering System

Selecting and specifying Farris pressure relief valves is simple using the numbering system that follows. Each digit of the type number has a distinct significance. The digits describe the basic valve series, orifice, seat design, inlet temperature range, body, bonnet and spring material, inlet type and pressure rating.

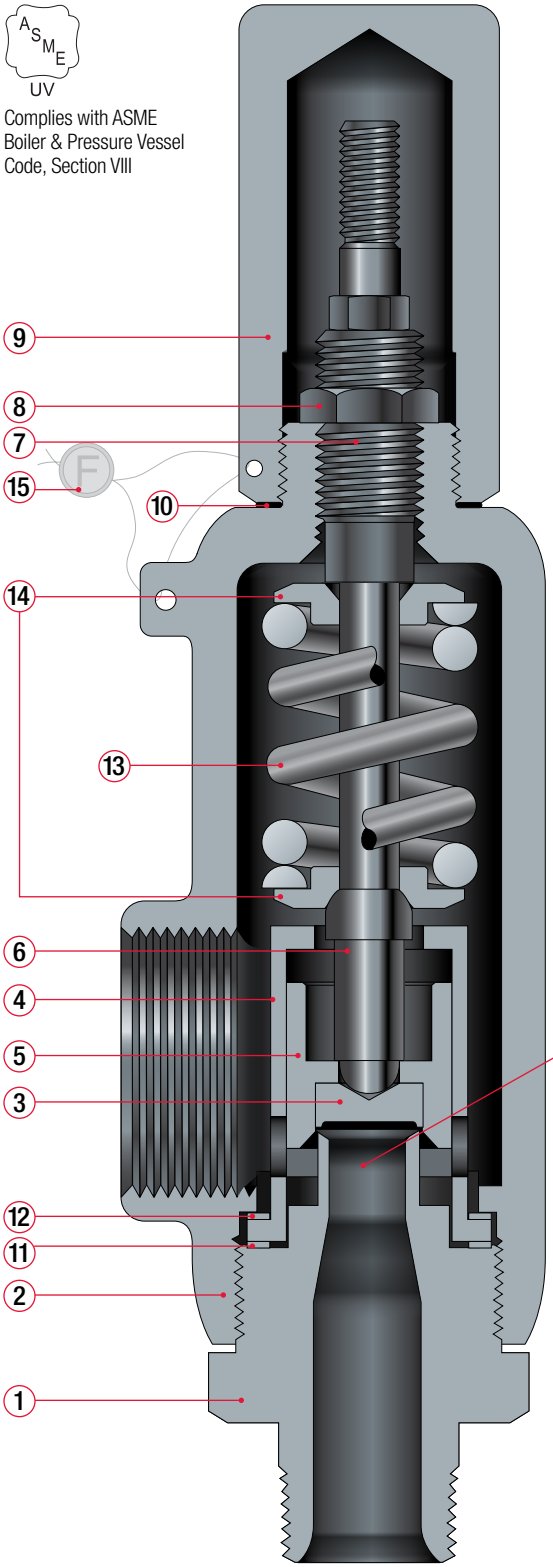
Ordering Information

Please specify the following so that we may process your order as quickly as possible.

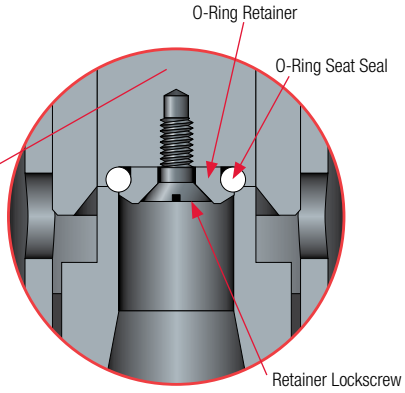
1. Quantity.*
2. Inlet and outlet sizes.
3. Farris type number.*
4. Inlet and outlet connections: MNPT, FNPT, flanged, socket weld, sanitary inlet or welding nipple.
5. Materials of construction if other than standard.
6. O-ring seat pressure seal material, if required.
7. Set pressure.*
8. Operating and relieving temperatures.*
9. Allowable overpressure.*
10. Fluid and fluid state.*
11. Backpressure, superimposed constant and/or variable, and built-up.*
12. Required capacity.*
13. Accessories: open or packed lever if required; test gag.
14. Code requirements, if any.



*As a customer service, we verify your selection and sizing. In order to do this, we must have this information.

General Notes:
1. Not all combinations of inlet and outlet sizes shown are available. Consult the selection tables of pages 4 and 5.
2. Test gag option is not available with open lever cap.
3. Available in O-ring seat design only. Consult the Farris Factory.
4. Duplex stainless steel available upon request, consult the factory.
5. Selection of proper soft good material is customer's responsibility.

2700 Series – Conventional



ASME UV

Complies with ASME Boiler & Pressure Vessel Code, Section VIII

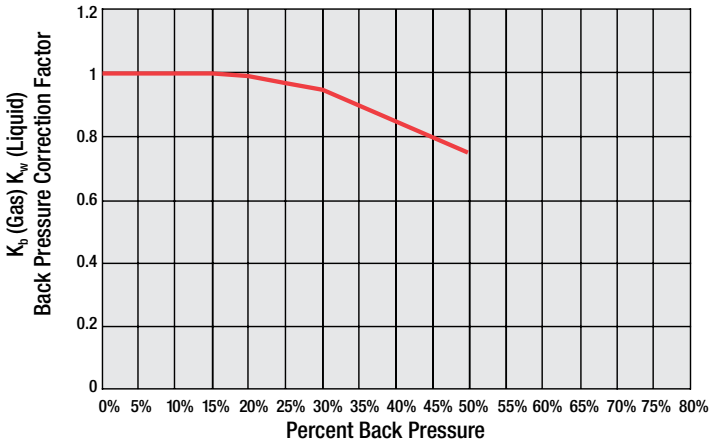
2700 Series – Balanced Design

UV

Complies with ASME Boiler & Pressure Vessel Code, Section VIII



Do you have variable back pressure? Can't use a balanced bellows design? Farris has the solution with the Series 2700 Balanced Design pressure relief valve. The balanced effect is achieved by isolating the upper valve chamber and eliminating any back pressure build-up in the bonnet affecting valve set pressure.

These valves are available in 1/2", 3/4" and 1" inlet sizes with a 1" outlet and two orifice areas. Pressure ranges from 15 to 1480 psig, standard soft seat design. Flanged and welded inlet and outlet connections are available with the same material options as the standard design.

Bill of Materials – Balanced Design

Item	Part Name	Standard Material

Series 2700 Back Pressure Correction Factor, Balanced Design

General Notes:
1. Other O-ring materials available. Consult the factory.
2. Flanged, socket weld, welding nipple and female inlet threaded designs available.
3. Temperature for balanced or O-ring seat design is limited by the elastomer selected. See page 4.

Viton is a registered trademark of DuPont Elastomers.

O-Ring Selection

The 2700 Series is available with an optional O-ring seat which minimizes fugitive emissions and costly product loss. This optional seat construction provides zero bubbles per minute leakage at 90% of set pressure per API Standard 527. The tables below list the set pressure and temperature range for both the elastomer and PTFE seat options.

O-Ring Seat Valve Pressure & Temperature Limits

Orifice	Pressure Range, psig[1]		Pressure Range, barg[1]	
	Elastomer Seat	PTFE Seat	Elastomer Seat	PTFE Seat
C High Pressure	15 to 1480 —	800 to 2500 2501 to 6500	1.0 to 102 —	55.1 to 172 172.1 to 345
D High Pressure	15 to 1480 —	800 to 1600 1601 to 6500	1.0 to 102 —	55.1 to 110 110.1 to 345
E	15 to 1480	600 to 2500	1.0 to 102	41.3 to 172
F	15 to 1480	600 to 1600	1.0 to 102	41.3 to 110
G	15 to 1000	200 to 1000	1.0 to 69	14 to 69

Material Availability

Material	Temperature Range[2]	
	°F	°C
Viton®[5]	-20° to +450°	-29° to +232°
Nitrile	-20° to +250°	-29° to +121°
EPDM	0° to +350°	-18° to +177°
Silicone	-150° to +450°	-101° to +232°
Kalrez®	-20° to +550°	-29° to +289°
PTFE	-300° to +500°	-184° to +260°

General Notes:
1. Maximum O-ring set pressure limit cannot exceed the pressure limit for a given type number and size as indicated in the metal seat selection tables.
2. Temperature range may vary depending on service fluid.
3. Ethylene propylene is suitable for steam service up to 350°F, PTFE up to 500°F.
4. Consult the Farris Factory for other materials.
5. We reserve the right to substitute comparable fluorocarbon materials from other manufacturers.

General Notes:

1. Available with optional elastomer or Teflon seat design as illustrated. Change the fourth digit of the type number from "A" to "C" for soft seat, "A" to "T" for Teflon. Example: 27DC23-M20 for soft seat, 27DT23-M20 for Teflon. See Selection Table for pressure and temperature limits.
2. Above type numbers indicate standard materials of construction. To select corrosive or low temperature materials, add type number suffix as indicated on pages 1 and 7.
3. Available in materials suitable for sour gas (H_2S) service to NACE Standards MR0103 and MR0175 / ISO 15156. Add "N1" (standard materials) or "N4" (all stainless construction) to the type number. Example 27DA23-M20/N1 & 27DA23-M20/N4.
4. For open or packed levers, change the second digit of the type number suffix. Examples: 27FA45-M70 for open lever, 27GA46-M40 for packed lever.
5. For socket weld or welding nipple connections, change the first digit of the type number suffix to "S" for socket weld or "W" for welding nipple inlet and outlet. Examples: 27DC33-S20 for socket weld, 27DA33-W20 for welding nipple. Maximum set pressures are identical to the MNPT inlet up to 500°F. For Temperatures above 500°F, consult the factory.
6. Female threaded inlet available. Change first digit of the type number suffix to "F". Example: 27EA34-F20. Maximum set pressure for female inlet is identical to male inlet except for 1/2 x 1" C orifice which may be set to max set pressure of 2500 psig.
7. For set pressures below 15 psig, consult the Farris Factory.

Selection Tables – Balanced Design (see notes on page 5)

Threaded Connections – MNPT x FNPT, U.S. Customary Units

Orifice Area Sq. In.	Valve Size Inlet x Outlet	Type Number	Maximum Set Pressure, psig	Max. Back Pressure psig at 100°F	Materials	
			-20°F to 450°F		Body / Bonnet	Spring
0.068	1/2 x 1 3/4 x 1 1 x 1	27CC13B-M20 27CC23B-M20 27CC33B-M20	1480	400	316 St. St./ Carb. St.	Stainless Steel

General Notes:
1. Any part where material field is blank is standard material.
2. For S4 trim, a 17-4 Ph. or 17-7 Ph. spring may be necessary for some pressures and temperatures.
3. For open and packed lever materials, see page 14.
4. Maximum set pressures for S4, M4, and H4 trim are the same as the carbon steel valves or the 316 St. St., Monel and Hastelloy C flange limits respectively, whichever is lower.
5. Temperature for balanced or O-ring seat design is limited by the elastomer selected. Consult chart on page 4.
6. Balanced design uses the same spring selection as the standard design. Where NACE compliant trim is specified, all trim classes for both conventional and balanced designs use springs made from Inconel X-750.

Inconel and Inconel X-750 are registered trademarks of Inco Alloys International. We reserve the right to substitute comparable material from other suppliers.

General Notes:

1. Capacities at 30 psig and below are based on 3 psi overpressure.
2. For sizing purposes, the coefficients of discharge K are 0.878 for air, gas & steam; 0.676 for water.

225.81	1-1/2 x 2	27FA45-M20	110	28	316 St. St./ Carb. St.	Stainless Steel
369.68	1-1/2 x 2-1/2	27GA46-M20	69	28	316 St. St./ Carb. St.	Stainless Steel

General Notes:

1. Available with optional elastomer or Teflon seat design as illustrated. Change the fourth digit of the type number from "A" to "C" for soft seat, "A" to "T" for Teflon. Examples: 27DC23-M20 for soft seat, 27DT23-M20 for Teflon. For O-ring pressure and temperature limits, see selection table on page 4.
2. Above type numbers indicate the standard materials of construction. To select corrosive or low temperature materials, add type number suffix as indicated on pages 1 and 7.
3. Available in materials suitable for sour gas (H_2S) service to NACE Standards MR0103 and MR0175 / ISO 15156. Add "N1" (standard materials) or "N4" (all stainless construction) to the type number. Example 27DA23-M20/N1 & 27DA23-M20/N4.
4. For open or packed levers, change the second digit of the type number suffix. Examples: 27FA45-M70 for open lever, 27GA46-M40 for packed lever.
5. For socket weld or welding nipple connections, change the first digit of the type number suffix to "S" for socket weld or "W" for welding nipple inlet and outlet. Examples: 27DA33-S20 for socket weld, 27DA33-W20 for welding nipple.
6. Female threaded inlet available. Change first digit of the type number suffix to "F". Example: 27EA34-F20. Maximum set pressure for female inlet is identical to male inlet except for 1/2 x 1" C orifice which may be set to 172 barg max set pressure.
7. For set pressures below 1 barg (15 psig), consult the Farris Factory.

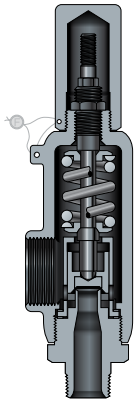
Farris Engineering Products

Process Pressure Relief Valves

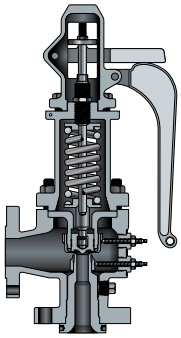


SERIES 2600/2600L

- ASME NB Certified: Air, Steam & Water
- Sizes: 1" x 2" to 20" x 24"
- Pressure Range: 15 psig to 6000 psig
- Temperature Range: -450°F to +1500°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Options: Balanced Bellows, O-Ring Seat, Open Bonnet
- CE Approved

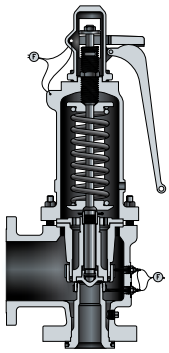
SERIES 3800 Pilot Operated

- ASME NB Certified: Air, Steam & Water
- Sizes: 1" x 2" to 12" x 16"
- Pressure Range: 15 psig to 6170 psig
- Temperature Range: -450°F to +500°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Actuation: Snap and Modulating Controls
- Options: Field Test Connections, Reverse Flow Preventer, Remote Depressurizing & Auxiliary Filters
- CE Approved



SERIES 2700

- ASME NB Certified: Air, Steam & Water
- Sizes: ½" x 1" to 1½" x 2½"
- Pressure Range: 15 psig to 6500 psig
- Temperature Range: -450°F to +750°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Options: Balanced Design, O-Ring Seats, Flanged, Socket Weld, Welding Nipple, & Sanitary Connections
- CE Approved



*Other materials available upon request. Please consult the factory.

Steam Safety Valves

SERIES 4200

- ASME NB Section I & VIII Certified: Steam & Air
- Sizes 1¼" x 1½" to 6" x 8"
- Pressure Range: 15 psig to 1000 psig
- Temperature Range: -20°F to +1000°F
- Materials: Carbon Steel, Stainless Steel, Chrome-Moly
- Options: Test Gag
- CE Approved

SERIES 6400

- ASME NB Section I & VIII Certified: Steam & Air
- Sizes: 1" x 2" to 4" x 6"
- Pressure Range: 15 psig to 1500 psig
- Temperature Range: -20°F to +1000°F
- Materials: Carbon Steel, Stainless Steel, Chrome-Moly
- Options: Closed Bonnet (6600) & Test Gag

Introduction

This Maintenance Manual is intended to present all the essential information you will need in order to keep your Farris valves in perfect operating condition. Generally, maintenance becomes necessary as a result of dirt or scale in the lines, exposure to service conditions, incorrect servicing, improper testing procedure, or improper installation.

This manual covers Series 3800 pilot-operated safety relief valves, which consist of two basic components: a pilot control and the main valve. The pilot control is a spring-loaded valve which senses the pressure and controls the opening and closing of the main valve.

Once the pilot-operated safety relief valve is isolated from the system pressure, it relieves the pressure from the inlet valve. Disconnect the pilot control from the main valve. Take particular note of the tubing connection orientation.

Follow pages 4 – 6 to perform maintenance on the main valve, pages 7 – 12 for the snap acting pilot controls, and pages 13 – 21 for the modulating pilot controls.

If a valve repair requires replacement of parts, only Farris components should be used. Use of parts from other than the original manufacturer will lead to potentially dangerous operating conditions. This valve is ASME Code certified. Unauthorized tampering and repair is in violation of the Code and will void certification that may apply to an ASME Code certified system. If faced with repairs exceeding the scope of this manual, you should contact the Farris Factory.

Safety Tips

- Make sure that the safety relief valve is isolated from the pressure source before it is removed.
- Stand clear and wear protective clothing when removing safety relief valve to prevent exposure to any types of deposits or corrosive debris which may have been trapped inside the valve.
- Do not stand near the discharge side of a safety relief valve when testing the valve.
- Always install a safety valve vertically as the internal parts are designed to operate in that position.
- Avoid hammer blows to the valve.
- Eliminate stress on the valve body whenever possible.
- Be careful when checking a safety valve for visible leakage.

Type Numbering System

The diagram below illustrates the Farris 3800 Series valve type numbering system. You will find this type of number on the nameplate of every Farris 3800 Series valve. The number found on each valve nameplate describes the valve with its construction and metallurgy. Valve types with numbers ending in "SP" are special valves. Example: 38DC12-120/S4/SP.

It may be necessary to contact the factory for assistance when replacement parts or maintenance is required on such valves.

Complete standard metallurgy details for individual parts in the 3800 Series valve line can be obtained by consulting a current sales catalog.

Example: Valve Type 38DC12X-120/S4

Operational Principles

Pressure in the protected vessel is sensed through a pressure tap (remotely connected or on the main valve body). The pressure tap is piped to the pilot control sensing line port. The vessel pressure is transmitted to the dome from the pilot control dome port.

When vessel pressure is below pilot control set pressure, the relief seat of the pilot control is closed. Inlet pressure of the main valve is equal to the dome pressure. The difference in the main valve nozzle seat area (smaller) and the dome area (larger) guarantees the main valve to be closed.

When the vessel pressure reaches set pressure, the pilot control relief seat opens. The pilot control relieves the dome pressure to the atmosphere. The force of the pressure in the inlet of the main valve causes the piston to lift from its closed position to relieve excess vessel pressure.

When vessel pressure reaches re-seat pressure (typically 95% of set pressure), the spring force overcomes the pressure force on the lower seat of the pilot control. The relief seat closes instantaneously with the opening of the lower seat. Pressure re-enters the dome and develops the force to move the piston down and close the main valve.

Main Valve

Disassembly

Item	Tool Description	Sizes
1	Wrenches	1/2", 5/8", 3/4", 7/8", 1-1/4"
2	O-Ring Pick	
3	1" Square Drive Socket Spanner	1-5/8", 2-1/4", 2-7/16", 3-5/8"
4	1-1/2" Square Drive Socket Spanner	4-1/2"
5	Screw Driver	
6	Wire Cutter	
7	Extension Bar	9", 18"
8	C-Clamp	
9	Eye Bolt	3/8", 1/2"

*Special tool for 6" and 8" inlet size valves.

For 1", 1-1/2" and 2" inlet size (Figure 5.1):

1. Place valve on a clean and well-lit workbench.
2. Remove wire seal.
3. Remove pilot control, bracket and interconnecting tubing.
4. Do not remove sensing nipple from body.
5. Loosen body hex nuts and remove from cover.
6. Using a nipple in the guide connection, carefully lift the guide-piston assembly straight up. Avoid tilting or dropping, which could damage nozzle face.
7. Invert the guide-piston assembly and slide the piston and spring out.
8. Remove cover seal.
9. Remove seat retainer from piston by unscrewing the set screw.
10. Remove seat seal and piston seal with O-ring pick.
11. Unscrew nozzle from body with a socket spanner.
12. Remove nozzle seal.

For 3", 4", 6" and 8" inlet size (Figure 5.2):

1. Place valve on a clean and well-lit workbench.
2. Remove wire seal.
3. Remove pilot control, bracket and interconnecting tubing.
4. Do not remove sensing nipple from body.
5. Loosen body hex nuts and remove from cover.
6. Lift cover using eyebolts and lifting device.
7. Remove spring.
8. Remove cover seal from top of guide.
9. Remove piston from guide using eyebolt and lifting device. Guide may also be lifted along due to piston seal friction. Hold the guide so that it will not be lifted with the piston.
10. Remove guide and guide seal from body.
11. Unscrew set screw to remove seat retainer from piston.
12. Remove piston seal and seat seal.
13. Unscrew nozzle from body with socket spanner or special tool. Remove nozzle from body.
14. Remove nozzle seal from body.

Cleaning and Repairing

Clean all parts thoroughly. Replace all O-rings. Inspect all parts and replace any that are worn. NO REMACHINING IS ALLOWED. Polish guiding surfaces, if required. For O-ring purchasing, be sure to specify original compound. If in doubt, contact the Farris Factory.

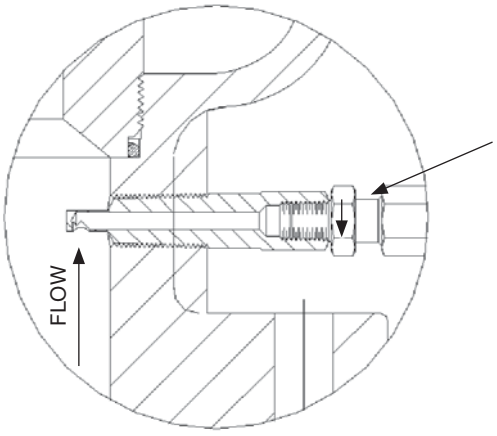
Assembly

For 1", 1-1/2" and 2" inlet size:

1. Refer to Figure 5.1 for construction details.
2. Visually inspect all parts to be assembled. Replace any parts that are worn or damaged.
3. Lubricate all threaded and mating surfaces with Bostik Never Seez® or equivalent.
4. Lubricate all seals with grease compound that is compatible to the elastomer.
5. Insert nozzle seal into recess on bottom of nozzle.
6. Screw nozzle into body using socket spanner.
7. Position piston with the seat facing up. Place seat seal on piston, making sure it fits evenly and symmetrically.
8. Place seat retainer on piston and tighten set screw, making sure that seat retainer sits evenly and symmetrically on piston. Use C-clamp to hold the piston and retainer in order to tighten the set screw fully.
9. Insert piston seal into the groove around the circumference of the piston.
10. Place cover seal onto the body.
11. Invert piston so that the seat retainer faces down. Place spring on top of piston. Insert piston into guide with the spring in between. Check manually if there is interference between the guide and the piston. There may be some resistance due to the piston seal and the spring.

Never Seez is a registered trademark of Bostik Inc.

Assembly (continued)



For 1", 1-1/2" and 2" inlet size (continued):

12. Carefully place the guide-piston assembly into the body.
13. Thread body hex nuts onto body studs and tighten.
14. If sensing nipple is removed from the body, thread it to the body and make sure the hole orientation is correct and agrees with the arrows marked (Refer to Figure 5.4).
15. The main valve is now ready for final assembly (See section on Final Assembly, page 22).

For 3", 4", 6" and 8" inlet size:

1. Refer to Figure 5.2 for construction details.
2. Follow steps 2-5 of the assembly procedure for 1", 1-1/2" and 2" main valves.
3. Screw nozzle into body with socket spanner. Use the special tool to tighten nozzle for 6" and 8" inlet size valves.
4. Place the guide seal onto the body.
5. Place guide into the body carefully. Make sure that guide is seated on the body evenly.
6. Position piston with the seat facing up. Place seat seal on piston, making sure it fits evenly.
7. Place seat retainer on piston and align the holes of retainer to the threaded holes on piston. Tighten set screws. Use C-clamp to hold the piston and retainer if necessary.
8. Insert piston seal into the groove around the circumference of the piston.
9. Invert piston so that the retainer faces down. Lift piston with eyebolt and lifting device, and lower it into the guide carefully. Push the piston into the guide if needed. There should not be any interference between the guide and the piston, but there may be some frictional resistance caused by the piston seal.
10. Place spring on top of piston.
11. Place cover seal on guide.
12. Lift cover with eyebolts and lifting device. Align the holes of the cover with the body studs. Lower cover over guide.
13. Thread body hex nuts onto body studs and tighten.
14. If sensing nipple is removed from the body, thread it to the body, making sure that hole orientation is correct and agrees with the arrow marked (Refer to Figure 5.4).
15. The main valve is now ready for final assembly (See section on Final Assembly, page 22).

30	Nameplate (Not Shown)	Stainless Steel

Figure 6.1a
Sample Snap-Acting Control Nameplate

General Notes:
1. For NACE Service (S7 Trim), substitute ethylene propylene.

Disassembly

Like any other safety relief device, the snap acting pilot control requires maintenance on a regular basis. Scheduling of maintenance is the responsibility of the end-user.

The snap acting pilot control shall be taken off-line before any maintenance and service work can be performed. Arrangements for an alternate safety relief device shall be made, if system protection is to remain in effect. Only authorized repair facility with qualified personnel shall do any maintenance/repair.

It is necessary to have the right tools (Table 6.1) and a replacement elastomer kit.

Table 6.1

Item	Tool Description	Sizes
1	Soft Jaw Bench Vise	
2	Adjustable Wrenches	
3	Set Of Open Ended Wrenches	1/4, 7/16, 9/16, 5/8, 3/4, 1-1/8, 1-1/2 & 2 Inch Span
4	O-Ring Pick	
5	Wire Cutters	

Once the pilot control is out of service

1. Place the pilot control on a clean and well-lit workbench.
2. Make a note of the physical condition of the valve before disassembly.
3. Cut and discard lead seals.
4. Remove the strainer assembly, the fitting for the piston (dome) line, and the exhaust port attachment.
5. Clamp the body of the valve on a bench vise. Remove the cap by unscrewing it from the bonnet.
6. Relieve the spring compression by loosening the spring adjustment screw. Take note of the number of turns from the locked position to the point where spring resistance is not felt. This will aid in setting the valve to its original set pressure.
7. Remove the bonnet from the body to expose the internals of the upper sub-assembly. CAREFULLY pull each part and arrange neatly on top of the workbench.
8. Loosen the blow down adjuster. Take note of the number of turns from the locked position to the lowest position. This will be helpful when setting the valve to its original setting.
9. Remove the lower sub-assembly by unscrewing the bushing from the body.
10. Unscrew the seat insert from the adjuster to access the lower disc assembly.

Cleaning & Repairing

Clean all parts with solvent and blow dry with air, being particularly careful on seating surfaces.

Inspect all parts and seating surfaces for excessive wear and corrosion. Discard and replace as necessary. NO REMACHINING IS ALLOWED. Replace all seals. Identify each new elastomer piece from the kit by matching it with Figure 6.2. Be sure to replace with proper compound for the particular service. If in doubt, contact the Farris Factory giving the serial number on the nameplate.

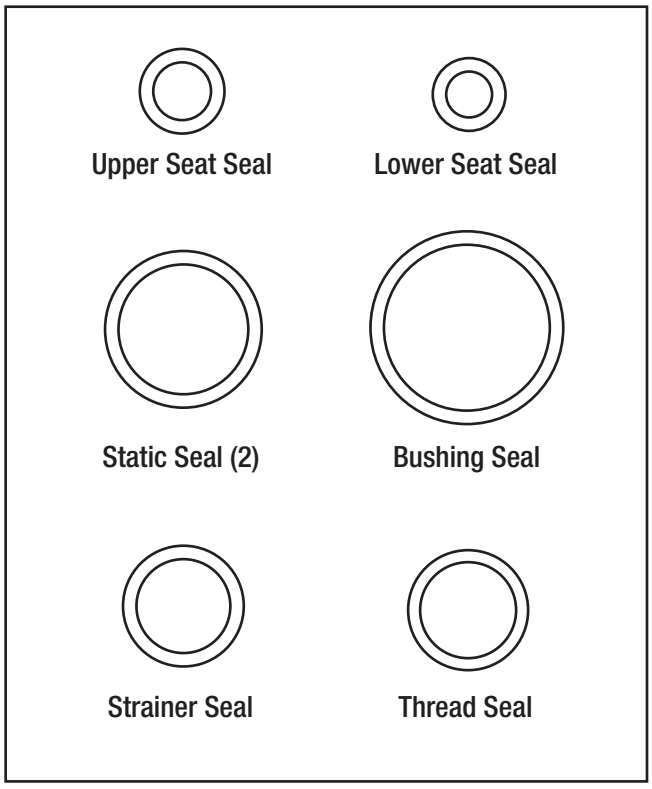

Figure 6.2
Seals for Snap Acting Pilot Control

Assembly

The upper and adjuster sub-assemblies have been identified in Figure 6.3 to help in distinguishing the vertical position of the snap acting control. Orientation of all the parts in each sub-assembly is likewise referred to in their vertical position.

Lubricate all threaded and mating surfaces with Bostik Never Seez (or equivalent).

A. Upper Sub-Assembly

1. Orient body with its length vertical, and the wider opening facing upward.
2. Place a static seal into the counter-bore of the body, via the upper opening.
3. Place the upper seat over the static seal, making sure the side with the bigger outside diameter protrusion faces downward.
4. Orient the guide with its flange upward. Insert the upper seat seal into the recess on the lower side of the guide.
5. Lower the guide onto the upper seat inside the body, making sure that the upper seat seal does not fall out and is in good contact with the upper seat and the guide. Also make sure that the two holes on the guide's side face the outlet (uppermost side-hole) of the body.
6. Slide disc into the guide, taking care not to damage the seats, and making sure that the upper disc rests fully on the upper seat seal. The correct orientation of the disc is with its rounded end facing upwards.
7. Place the two (2) spring buttons over the two ends of the spring. Hold the buttons over the ends of the spring with thumb and forefinger.
8. Match the lower spring button over the rounded top of the disc making sure that rounded top of the disc fits into the recess in the lower spring button.
9. Lower the bonnet over the spring button's subassembly and screw tightly into the body.
10. Screw the spring adjusting screw into the jam nut until the jam nut is about two thirds (2/3) up the spring adjusting screw.
11. Screw the spring adjusting screw – jam nut subassembly into the top of the bonnet. Stop as soon as resistance from the upper spring button is felt.

B. Adjuster Sub-Assembly

1. Position the lower seat seal on the retainer making sure it fits evenly and symmetrically.
2. Lower the retainer into the lower disc with the lower seat seal fitting snugly between the retainer and the lower seat.
3. Lower the lower seat – retainer sub-assembly into the adjuster with the lower disc entering the adjuster first.
4. Screw the seat insert into the adjuster and tighten.
5. Place the second static seal in the groove on the side of the adjuster, making sure it fits evenly.
6. Place the bushing seal on the bushing beyond the threads and against the flat back of the bushing's hex head.
7. Screw the bushing onto the adjuster with the hex head of the bushing facing downward.
8. Position a thread seal on the threads of the adjuster and against the hex head of the bushing.
9. Screw the lock nut onto the adjuster and tighten.
10. Place the spacer rod into the hole of the seat insert until it rests on the top of the retainer.
11. Insert the adjuster sub-assembly into the body through its lower end, making sure the spacer rod passes through the hole of the upper seat.

C. Strainer

1. Position the strainer into the inlet (lowest) port of the body, flange first.
2. Place the second thread seal into the inlet port, bottoming on the strainer flange.
3. Screw the strainer housing into the inlet port and tighten.

D. Connections

1. Connect the sensing line into the strainer housing in the sensing line port of the body.
2. Use the dome line port in the middle of the body to connect to the dome of the main valve.
3. Leave the exhaust port open to the atmosphere for exhaust, or connect it to an exhaust plenum. The snap acting pilot control is ready to be set and tested.

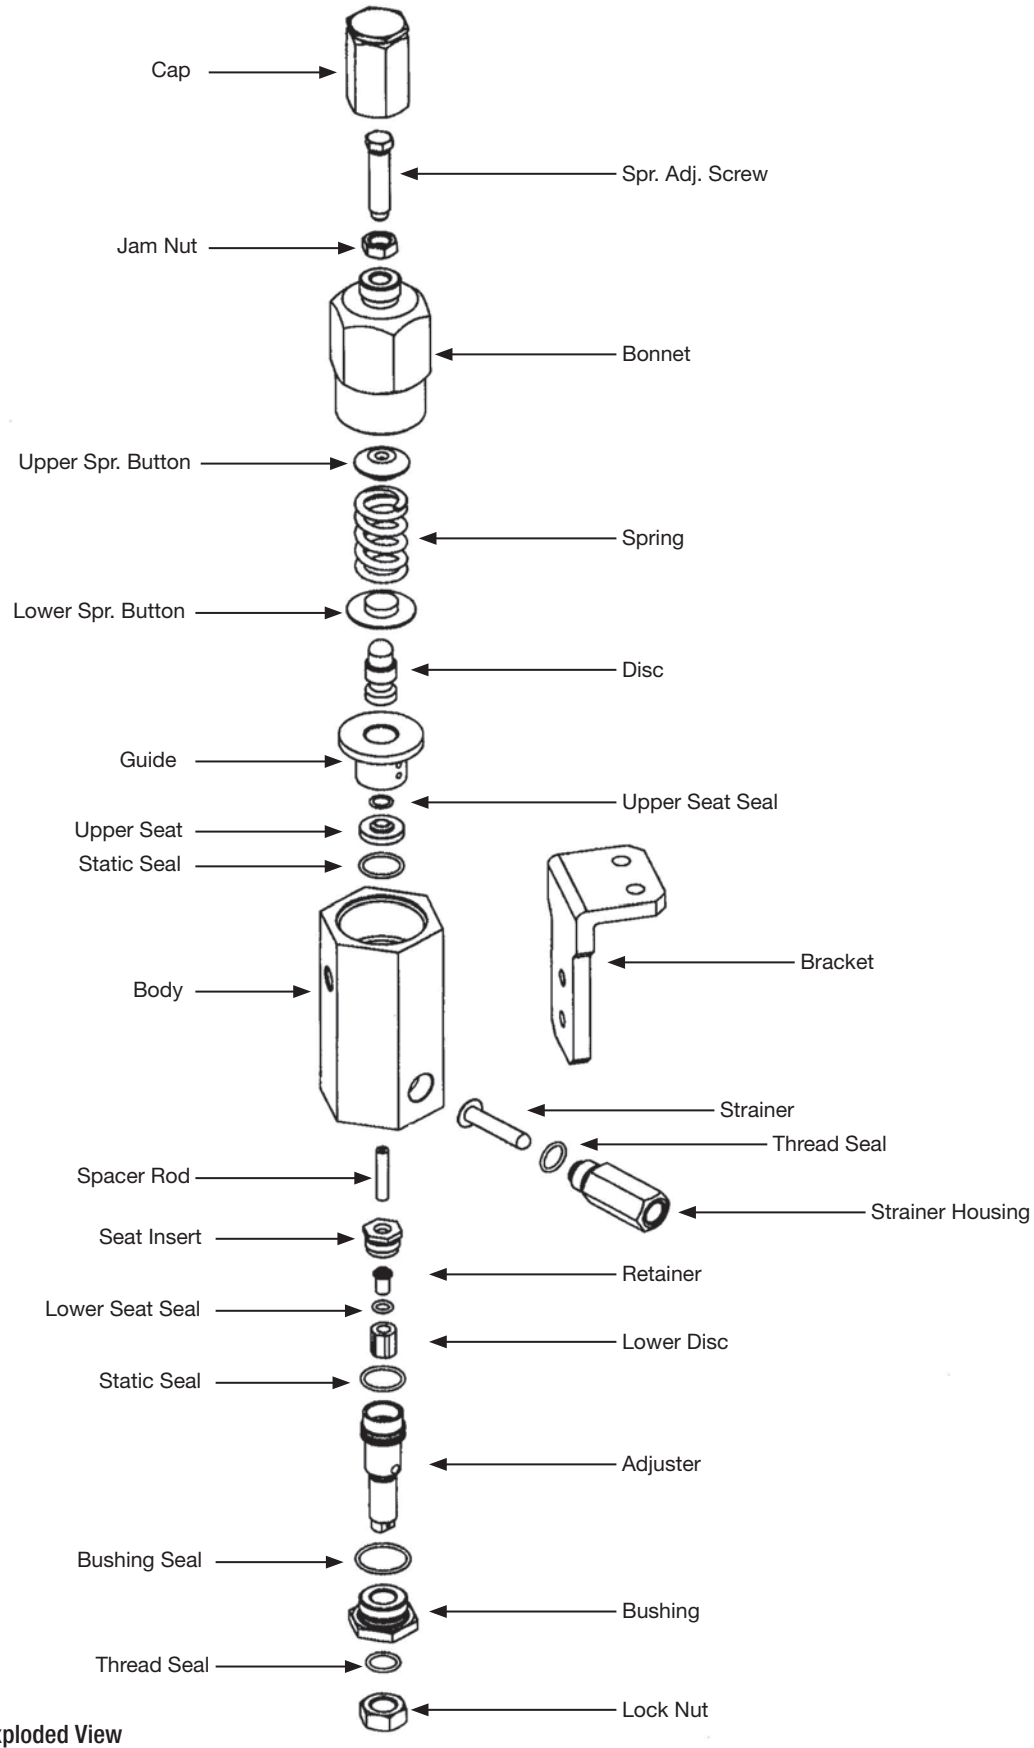

Figure 6.3
Snap-Acting Control Exploded View

Setting & Testing the Snap Acting Pilot Control

Testing of the snap acting pilot control will be performed only after correct assembly has been accomplished. Read the entire test procedure. Test should be conducted only by qualified personnel.

Connect the snap acting control to the test rig (see Test Stand Schematic, Figure 6.4).

A. Test Stand Schematic Description

- **V1 -** Isolation valve, normally open when test is in progress.
- **V2 -** Needle valve, regulates pressure into vessel.
- **V3 -** Vent valve, normally closed when going up on the receiver pressure; also used to dump pressure from vessel.
- **V4 -** Vent valve, normally closed when testing, used as an auxiliary pressure dump valve.
- **P1 -** Pressure gage, to read dome pressure.
- **P2 -** Pressure gage, to read vessel pressure.

Vessel Receiver – Test pressure receiver simulating a vessel.

Dome Receiver – Test pressure receiver simulating the dome/piston volume on the main valve.

In-Line Filter – Filters air going into the vessel.

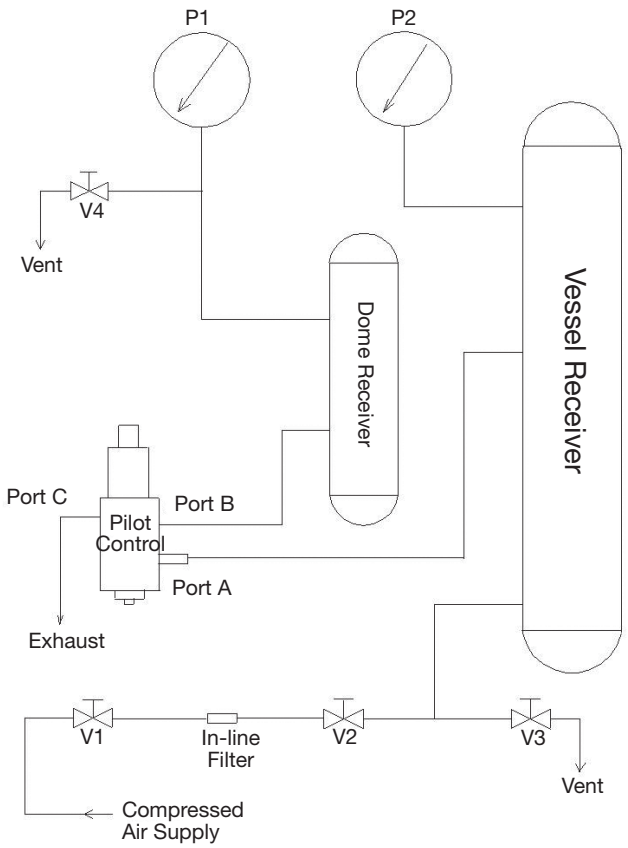

Figure 6.4 Test Stand Schematic

B. Port Identification and its Connections

Port A: Where the pilot control senses the vessel pressure. Connect this to vessel receiver.

Port B: Where the pilot control is connected to the dome or piston of the main valve. Connect this to the dome receiver.

Port C: The exhaust port, normally vented to the atmosphere (i.e. piped to the outlet of the main valve, with bug screen).

C. Set Pressure Testing

Setting the pilot control is similar to setting a spring loaded valve where the spring is being compressed to the desired set pressure. The set pressure is distinguished by the pop.

1. Refer to Table 6.2 (page 12) for the nominal number of turns on the spring adjusting screw required to set the valve. Start counting the number of turns when the spring adjusting screw approximately touches the upper spring button. This can be done by feel.
2. Set the blow down adjuster at its lowest position.
3. Pressurize the vessel receiver by slowly opening V2. Note: both pressure gages P1 and P2 shall have the same pressure reading.
4. Record pop (set) pressure. Note: After pop, P1 should drop to zero. If it does not, carefully turn the blow down adjuster up to equalize P1 and P2. Pop again to confirm zero pressure on P1. Overpressurize the vessel receiver to 10% or 3 psig, whichever is greater.
5. Fine tune the set pressure and blow down to requirement. Use Table 6.2 as a guide to the number of turns required.
6. When the set (pop) pressure on P2 is reached, P1 will read zero pressure (main valve is in the open or flowing mode).
7. Vent the vessel pressure slowly through V3 to determine the re-seat pressure of the valve. Proper re-seat (commonly there's a slurping sound) occurs when P1 and P2 read the same pressure.
8. When performance is satisfactory, tighten the lock nut, jam nut and cap.

D. Pilot Seat Tightness Testing

A 5/16" OD x 0.035" wall thickness copper tube or equivalent immersed no more than 1/2" deep in water shall be connected to the exhaust port. Raise the receiver pressure to the test pressure described below and observe for bubbles. No bubbles are allowed.

Test pressure:

- 90% of set pressure if set pressure is 50 psig or more OR
- 5 psig below set pressure if set pressure is less than 50 psig

Brush soap and water solution on joints internally exposed to pressure. Observe for leakage. No leakage at any joint is allowed.

E. Test Conclusion

Vent out pressure from the receiver tank. Unhook all test connections.

Go on to page 22 for final assembly.

Figure 7.1a Sample PCM Nameplate

General Notes:
1. For NACE service (S7 trim), substitute ethylene propylene soft goods and Inconel® X for return springs.
   Inconel is a registered trademark of Special Metals Corporation.

Disassembly

Like any other safety relief device, the modulating pilot control requires maintenance on a regular basis. Scheduling of maintenance is the responsibility of the end-user.

The modulating pilot control shall be taken off-line before any maintenance and service work can be performed. Arrangements for an alternate safety relief device shall be made, if system protection is to remain in effect. Only authorized repair facility with qualified personnel shall do any maintenance/repair.

It is necessary to have the right tools (Table 7.1) and a replacement elastomer kit.

Table 7.1

Item	Tool Description	Sizes
1	Soft Jaw Bench Vise	
2	Adjustable Wrenches	
3	Set Of Open Ended Wrenches	1/4, 7/16, 9/16, 5/8, 3/4, 1-1/8, 1-1/2 & 2 Inch Span
4	O-Ring Pick	
5	Wire Cutters	

Once the pilot control is out of service:

1. Place the pilot control on a clean and well-lit workbench.
2. Make a note of the physical condition of the valve before disassembly.
3. Cut and discard lead seals.
4. Remove the strainer assembly, the fitting for the piston (dome) line, and the exhaust port attachment.
5. Clamp the body of the valve on a bench vise. Remove the cap by unscrewing it from the bonnet.
6. Relieve the spring compression by loosening the spring adjustment screw. Take note of the number of turns from the locked position to the point where spring resistance is not felt. This will aid in setting the valve to its original set pressure.
7. Remove the bonnet and piston guide from the body to expose the diaphragm/spool sub-assembly. CAREFULLY arrange each part neatly on top of the workbench.
8. Release the body from the vise, invert, and re-clamp.
9. Remove the spool/cap by unscrewing from the body.
10. Unscrew the seat insert from the adjuster to access the lower disc assembly.

Cleaning & Repairing

Clean all parts with solvent and blow dry with air, being particularly careful on seating surfaces.

Inspect all parts and seating surfaces for excessive wear and corrosion. Discard and replace as necessary. NO REMACHINING IS ALLOWED. Replace all seals. Identify each new elastomer piece from the kit by matching it with Figure 7.2. Be sure to replace with proper compound for the particular service. If in doubt, contact the Farris Factory giving the serial number on the nameplate.

Figure 7.2 within this specification shows the actual sizes of O-ring seals. Match seals to the drawing for ease of seal identification. Immediately following Figure 7.2 are additional seals that are present depending on the type of modulating pilot control being assembled.

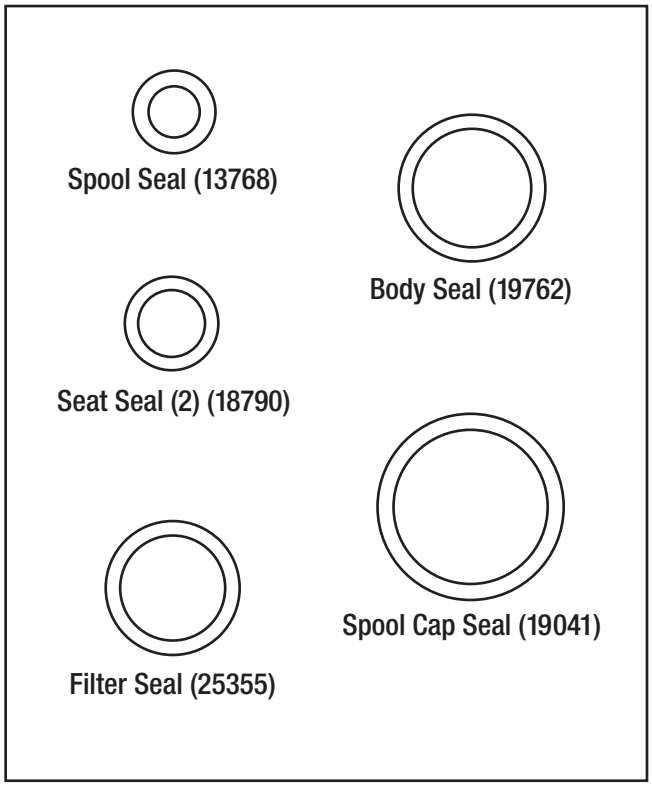

Figure 7.2
Seals for Modulating Pilot Control

Other seals specific to the modulating pilot type:

PCM – Diaphragm (26765)

HPCM – Piston Seal (7267), and Back-Up Ring (27106)

PCMS – Spring Energized Seal (27847), and Guide Seal (7272)

Assembly

A. Spool Sub-Assembly

Spool sub-assembly is identical between the PCM, HPCM, and PCMS.

1. Lay out the parts in sequence as shown in Figure 7.3a, on a clean and well-lit work area.
2. The spool uses three O-ring seals. The first (seat seal #1) is installed in the gland at the top near the flange, an intermediate one (seat seal #2) about midsection, and the lower ring (spool seal) at the bottom. Install seat seal #1 on the spool, starting from the bottom and working it to the flange end.
3. Insert the bottom of the spool through the top hole of the inlet seat. The bottom of the spool should protrude through the bottom end of the inlet seat.

s5. Install the spool seal on the bottom seal gland of the spool.

6. Install the body seal onto the seal gland located on the bottom of the inlet seat.
7. This sub-assembly (Figure 7.3b) is ready to be installed into the appropriate pilot control.

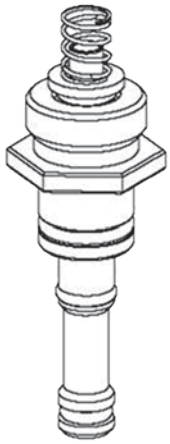

Figure 7.3b
Spool Sub–Assembly

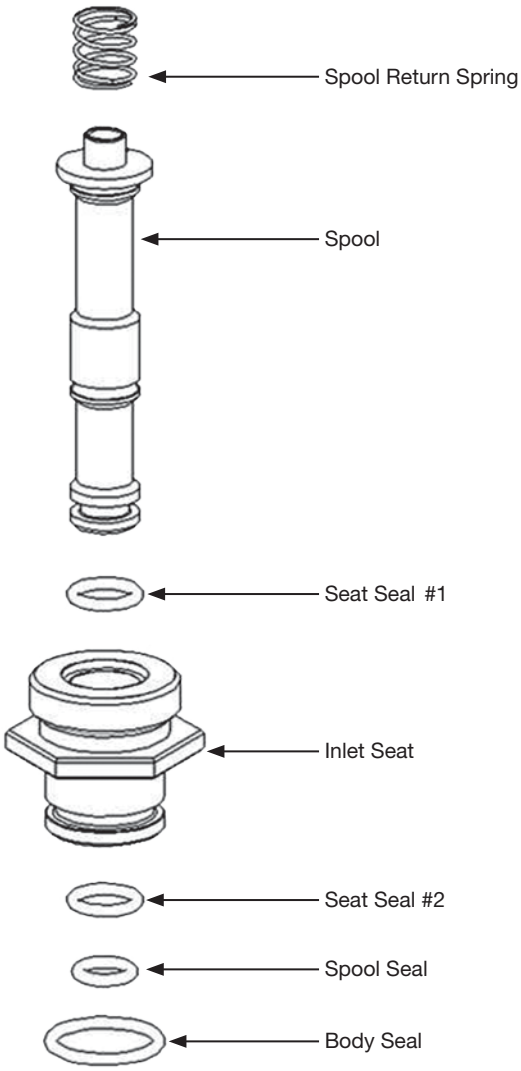

Figure 7.3a
Spool Sub–Assembly, Exploded

Assembly (continued)

B. Piston Sub-Assembly

Use the instructions for the appropriate type of modulating pilot control. Layout the components of the sub-assembly as shown in the corresponding figure.

PCM – Diaphragm Style

1. Lay out the parts in sequence as shown in Figure 7.4a, on a clean and well-lit work area.
2. Invert the diaphragm piston (threaded hole facing up) and clamp it on top of a bench vise using the milled flats provided.
3. Mate the diaphragm's back-side to the diaphragm piston. The back-side can be identified by two circular protrusions on its surface and is the non-pressurized side.
4. Align the axis of the diaphragm retainer with the hole on the diaphragm. Mate the diaphragm retainer to the flat surface of the diaphragm.
5. Install the retainer screw through the diaphragm retainer and diaphragm hole and into the diaphragm piston threads. Use a 3/16" hex key to tighten the retainer screw into the assembly.
6. Insert the spool return spring into the diaphragm retainer, bottoming one end of the spool return spring on the shoulder of the retainer screw.
7. Screw the inlet seat into the diaphragm retainer. The other end of the spool return spring should seat on the flange of the spool. Use a 1-1/8" and a 1" open end wrench on the wrenching flats of the diaphragm retainer and the inlet seat, respectively to tighten together.

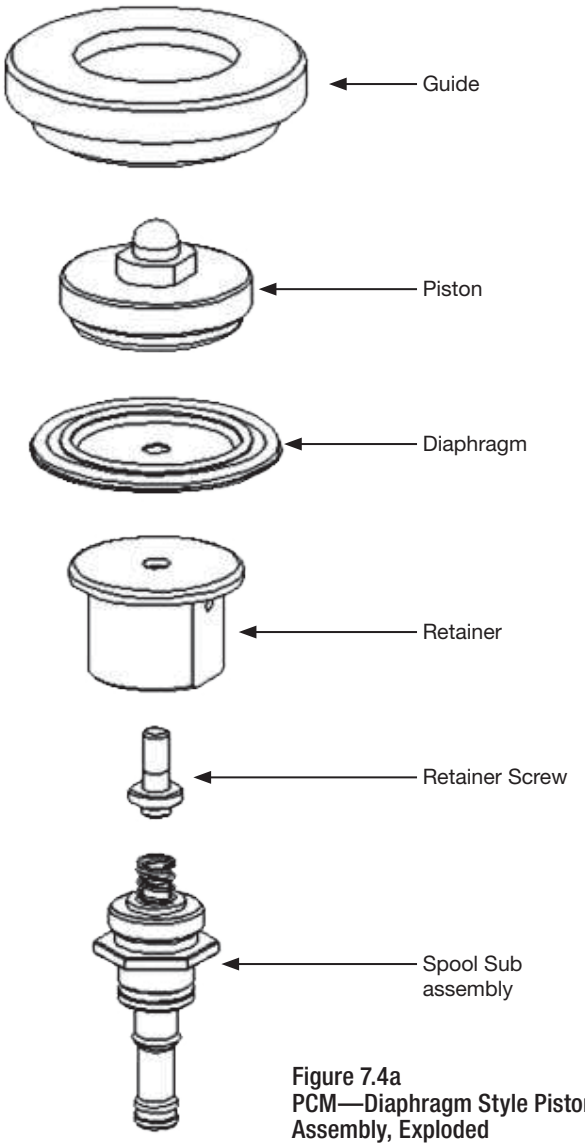

Figure 7.4a
PCM—Diaphragm Style Piston Assembly, Exploded

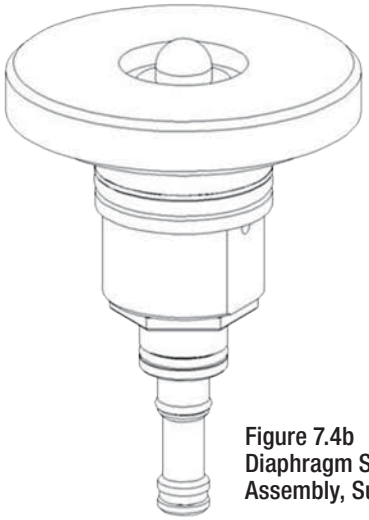

Figure 7.4b
Diaphragm Style Piston Assembly, Sub-Assembly

Assembly (continued)

B. Piston Sub-Assembly (continued)

HPCM – High Pressure Piston Style

1. Lay out the parts in sequence as shown in Figure 7.5, on a clean and well-lit work area.
2. Install the piston seal on the piston seal gland. Install the back-up ring on the gland. Note the ring to be in the upper part of the gland when the piston is oriented vertically.
3. Screw the inlet seat (with spool sub-assembly pre-assembled earlier) into the piston. One end of the spool return spring should seat in the counter bore inside the piston and the other end on the flange of the spool. Use a 1-1/8" and a 1" open end wrench on the wrenching flats of the retainer and the inlet seat, respectively to tighten together.

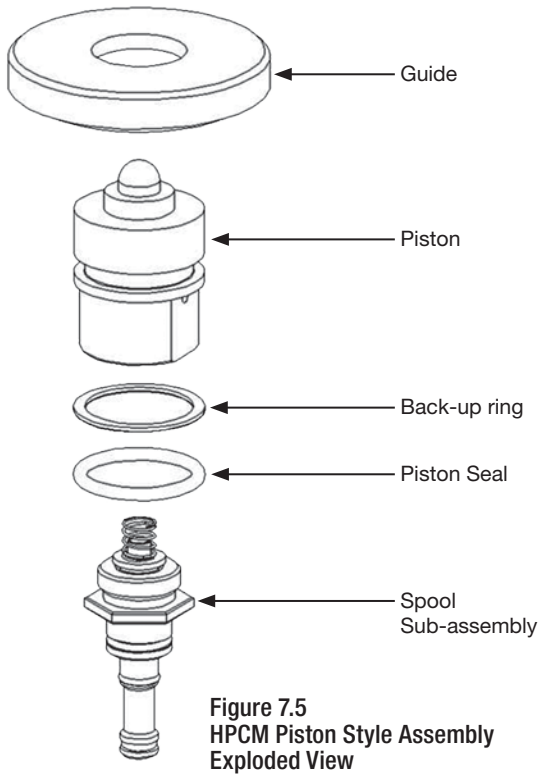

Figure 7.5
HPCM Piston Style Assembly
Exploded View

PCMS – Low and High Temperature Service Piston Style

1. Lay out the parts in sequence as shown in Figure 7.6, on a clean and well-lit work area.
2. Invert the piston (threaded hole facing up) and clamp it on top of a bench vise using the milled flats provided.
3. Install the spring-energized seal with spring exposed mating the bottom of the u-shaped seal with the piston outer ledge.
4. Align the axis of the retainer with the hole on the piston.
5. Install the retainer screw through the retainer and into the piston threads. Use a 3/16" hex key to tighten the retainer screw into the assembly.
6. Insert the spool return spring into the retainer, bottoming one end of the spool return spring on the shoulder of the retainer screw.
7. Screw the inlet seat (with spool sub-assembly pre-assembled earlier) into the retainer. The other end of the spool return spring should seat on the flange of the spool. Use a 1-1/8" and a 1" open end wrench on the wrenching flats of the retainer and the inlet seat, respectively to tighten together.

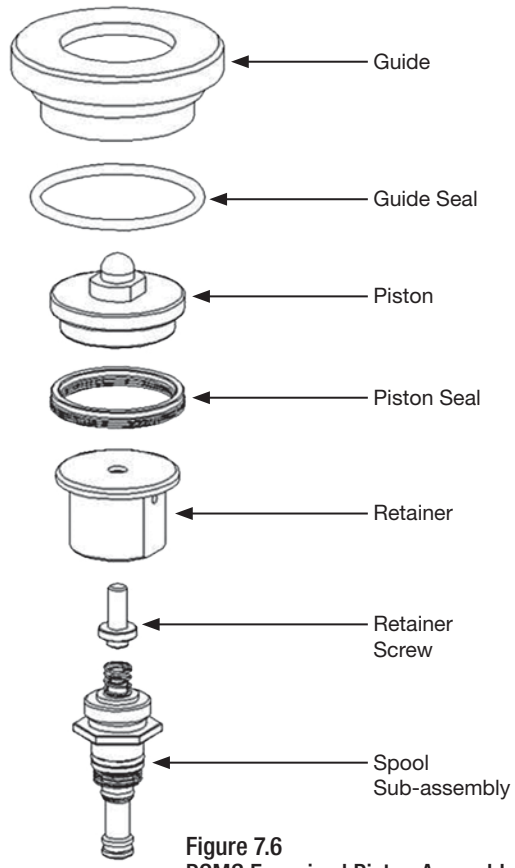

Figure 7.6
PCMS Energized Piston Assembly
Exploded View

Assembly (continued)

C. Body/Bonnet Assembly

1. Lay out the parts in sequence as shown in Figure 7.7, on a clean and well-lit work area.
2. Lightly lube the spool cap seals and install on the seal glands of the spool cap.
3. Insert the spool cap into the base of body and tighten.
4. Clamp the valve vertically in a vise by the body flange flats. Insert the lower return spring.
5. Lubricate the seals in the spool sub-assembly and insert into the body bore, as shown on Figure 7.7. Spool extension should fit into the hole of the spool cap. Apply a light amount of pressure on top of the internal sub-assembly to check for bottoming of seat seal #2 to the spool cap seat.
6. Install the guide over the spool sub-assembly and into the annular opening between the body bore and the diaphragm/piston circumference. For the PCMS the guide seal goes in before the guide.
7. With one spring button on each end of the spring, mate the bottom end to the top of the hemispherical radius on top of the diaphragm piston.
8. Install the bonnet over the spring and mate the bonnet counter bore surface to the guide. Orient the bonnet vent hole axis to the body exhaust port axis on the same plane.
9. Bolt down the bonnet using the bonnet cap screws through the bonnet flange holes and into the threaded holes of the body flange. Tighten the bolts in a crisscross pattern for uniform loading.
10. Screw the spring adjusting screw (SAS) into the jam nut and then into the bonnet until the SAS makes contact with the spring button.
11. Insert the filter; flange first, into the inlet port on the body. This port is closest to the body flange as shown in Figure 7.7. Install the filter seal over the filter and into the inlet port, bottoming on the filter flange inside the port.
12. Screw the filter housing into the body inlet port and tighten.

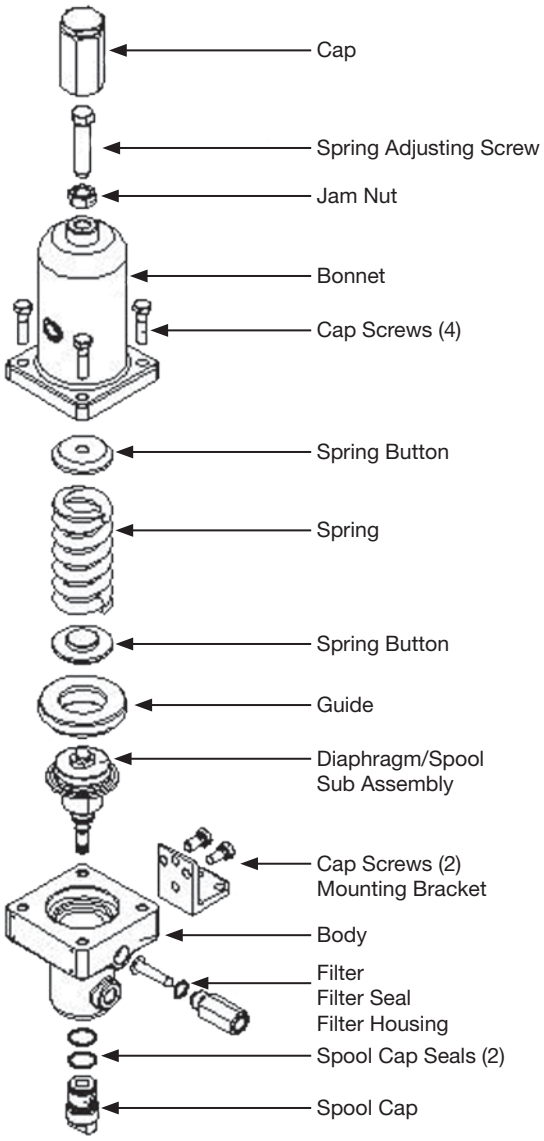

Figure 7.7

Setting & Testing the Modulating Pilot Control

Testing of the modulating control will be performed only after correct assembly has been accomplished. Read the entire test procedure. Test should be conducted only by qualified personnel.

Testing PORV as a Unit

A test stand typically used for conventional safety relief valve testing will be adequate to perform this test method.

1. Complete the assembly of the pilot control and the main valve.
2. Mount the main valve to the test stand.
3. Remove the modulating control cap to access the spring adjusting screw (SAS).
4. Using a wrench, rotate the SAS down (clockwise) a few turns to compress the modulating control spring.
5. Pressurize the test stand to the desired set pressure and let the pressure stabilize. If the main valve relieves before the desired set pressure, depressurize the test stand and turn the SAS down some more to compress the modulating control spring further.
6. When test stand pressure is at desired set point, unscrew the SAS (counterclockwise) slowly until the main valve piston starts to lift. For air testing, an audible leak on the main valve outlet is the common indication of the piston starting to lift. For liquid testing, the first visible flow of fluid from the main valve outlet is the common indication that the piston is starting to lift. The body bowl should be filled with water up to the lowest edge of the discharge outlet prior to testing to aid in determining first flow.
7. When test stand pressure is at desired set point, unscrew the SAS (counterclockwise) slowly until the main valve piston starts to lift. For air testing, an audible leak on the main valve outlet is the common indication of the piston starting to lift. For liquid testing, the first visible flow of fluid from the main valve outlet is the common indication that the piston is starting to lift. The body bowl should be filled with water up to the lowest edge of the discharge outlet prior to testing to aid in determining first flow.
8. The spring compression is close to the desired setting. Use the jam nut to lock the SAS in place.
9. Depressurize the test stand to approximately 80% of the desired set pressure.
10. To confirm the set point, slowly pressurize the test stand until the opening of the main valve is confirmed by either an audible opening of the piston (air), or a visible flow of water from the main valve outlet (liquid test). Fine tune setting by turning down (clockwise) the SAS to increase or unscrewing (counterclockwise) the SAS to decrease the set point. Tighten the jam nut to lock the SAS in place after final adjustments.
11. Install the modulating control cap and tighten before proceeding to Pilot Seat Tightness Testing, section D, in this procedure.

Testing the Modulating as a Separate Unit: (Alternate Method)

Connect the modulating control to the test rig (See Test Stand Schematic, Figure 7.5).

A. Test Stand Schematic Description

- **V1-** Isolation valve, normally open when test is in progress.
- **V2-** Needle valve, regulates pressure into vessel.
- **V3-** Vent valve, normally closed when going up on the receiver pressure; also used to dump pressure from vessel.
- **V4-** Vent valve, normally closed when testing, used as an auxiliary pressure dump valve.
- **P1-** Pressure gage, to read dome pressure.
- **P2-** Pressure gage, to read vessel pressure.

Vessel Receiver – Test pressure receiver simulating a vessel.

Dome Receiver – Test pressure receiver simulating the dome/piston volume on the main valve.

In-Line Filter – Filters air going into the vessel.

Setting & Testing (continued)

B. Port Identification and its Connections

Port A - is system pressure sensing port, it is the port on the filter housing.

Port B - is 180º from Port A, it connects to the main valve dome.

Port C - is the dome exhaust port, it is the lowest port in the body, 90º from Port A and Port B.

Port D - is the bonnet vent.

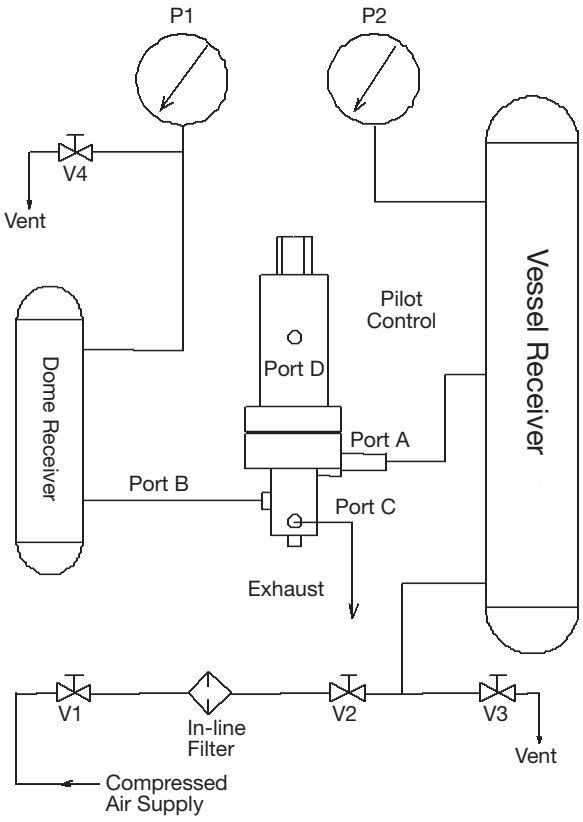

Figure 7.5 Test Stand Schematic

C. Set Pressure Testing

1. Mount the pilot control in the test stand following the port connections shown on the test stand schematic (Figure 7.5).
2. Compress the spring by turning the spring adjusting screw (SAS) clockwise, a few turns after coming in contact with the spring button.
3. Increase the pressure on the vessel receiver and observe the increase in pressure on the dome vessel. If the dome pressure does not increase along with the receiver pressure, stop and vent the pressure, increase the spring compression by turning the SAS clockwise and start over.
4. Increase the pressure on the vessel receiver to the desired set pressure. Dome pressure should read the same.
5. Decrease the spring compression by turning the SAS counterclockwise, to drop the pressure of the dome receiver. The valve is set once the pressure on the dome receiver drops down to the pressure (P_d) determined by the equation (eq. 1).
6. Verify the set point by decreasing the vessel receiver pressure to approximately 80% of the desired set and then increasing to the desired set. At the desired set pressure the dome receiver pressure should have dropped to the pressure (P_d) determined by the equation below (eq. 1).
7. Lock the spring adjusting screw with the jam nut and install the cap. Mount the pilot control to the main valve and connect the corresponding ports together. Proceed to Pilot Seat Tightness Testing Section D.

Equation to determine dome pressure at a given set pressure:

$$P_d = P_o \times m \qquad \text{(eq. 1)}$$

Where:

P_d = dome pressure at desired set pressure, tolerance = +/- 10% of value

P_o = desired set pressure

m = valve size multiplier, taken from table below

The piston vs. seat area ratio for the DX, DL and DM serial suffix valves vary by inlet size. The table below provides the correct multiplier, by inlet size, to allow the setting of a modulating pilot control, separate from the main valve.

The values for item 2 should only be used for the air, gas and vapor service valves, serial suffix DX and DM. The liquid service valves, serial suffix DL, should be converted to the current DA serial design for optimum performance.

Item	Serial Suffix	m Multiplier
1	DA (All Sizes)	0.70
2	DX, DL and DM	See Below
2a	1	0.41
2b	1-1/2	0.56
2c	2	0.60
2d	3 and 8	0.64
2e	4 and 6	0.69

Setting & Testing (continued)

D. Pilot Seat Tightness Testing

A 5/16" OD x 0.035" wall thickness copper tube or equivalent, immersed no more than 1/2" deep in water, shall be connected to the exhaust Port C and Bonnet Vent Port D. Raise the receiver pressure to the test pressure described below and observe for bubbles. No bubbles are allowed.

Test pressure:

- 90% of set pressure if set pressure is 50 psig or more OR
- 5 psig below set pressure if set pressure is less than 50 psig

Brush soap and water solution on joints internally exposed to pressure. Observe for leakage. No leakage at any joint is allowed.

Proceed to Final Assembly and Test.

Table 7.2 Modulating Pilot Control Spring Chart

Set Pressure (psig)	PCM & PCMS Spring Number	HPCM Spring Number
15 - 74	E3486PH	HPCM Control Not for use in these pressure ranges, consult factory

Final Assembly

The pilot control should have been tested and set prior to final assembly.

Assemble the pilot control to the main valve. Attach the mounting bracket securely to the pilot control. Bolt the mounting bracket to the main valve. Clear foreign matter in tubing by blowing compressed air through one end. The port connection and its orientation shall be exactly the same as the original configuration to guarantee valve operation. Refer to Figures 6.4 and 7.5 for port identification of the pilot control. Connect port A of the pilot control to the inlet of the main valve. Connect port B of the pilot control to the dome or piston of the main valve. Port C is the exhaust port, normally vented to the atmosphere.

Check all fittings for tightness. Pressurize the test stands to 95% of set pressure

Use Snoop or soap and water solution to check all tube fittings and joints internally exposed to pressure. No leaks are allowed on these joints. All leakage shall be corrected as necessary.

Test the assembled pilot valve for proper setting.

Main Valve Seat Tightness Test

Refer to Figure 8.1. Mount bubble test flange, tube, and cup on valve outlet. A tube of 5/16² OD X .035" wall submerged 1/2" below the water level shall be connected to the valve outlet. Apply nitrogen or air pressure to the valve inlet, equal to 90% of set pressure (if set pressure is 50 psig or more) or 5 psig below set pressure (if set pressure is less than 50 psig). This method tests for total leakage across valve seat plus piston seal leakage. No leakage is allowed.

The valve is now ready to be placed back in service.

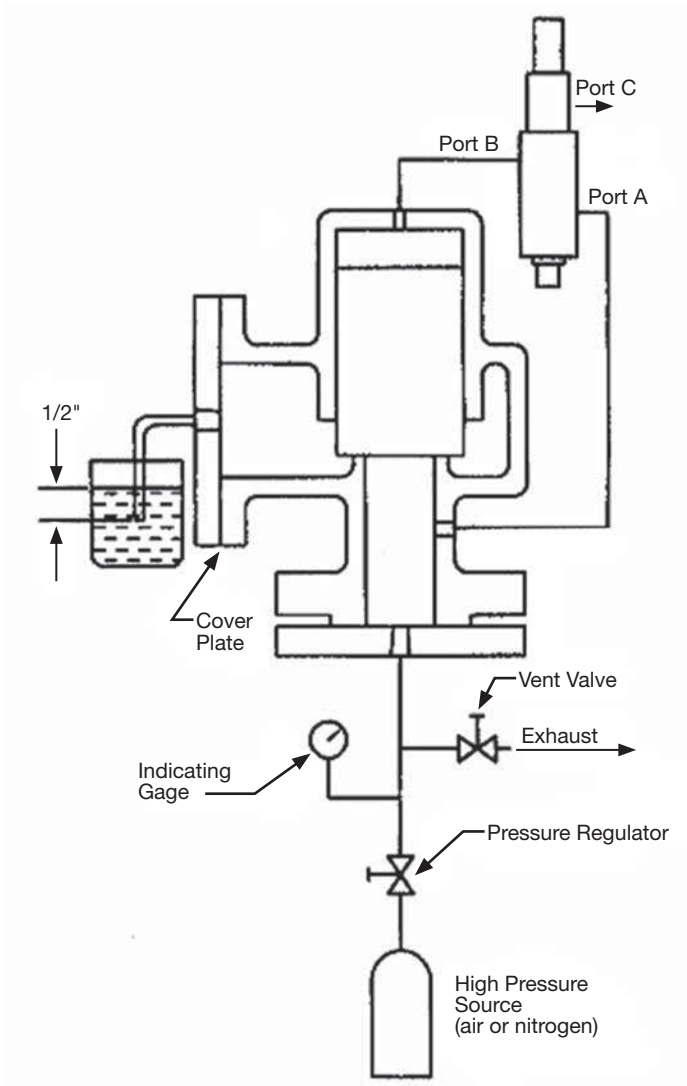

Fig. 8.1 Main Seat Tightness Test

Farris Aftermarket Services

Real Value Behind Every Valve.

Farris Engineering's aftermarket department and global FAST Center Network adds value to every Farris valve. At Farris, our work is never done. Once we sell you a valve, our FAST Team is there to keep your valves in service and your plant safe. Our FAST Centers are:

Responsive. Farris Engineering and its FAST Centers understand the need to quickly and efficiently respond to customer needs.

- **Global Access** - FAST Centers work with and in our extensive representative network, providing support to all global regions.
- **24/7 Valve Service and Replacement** - FAST Centers offer quick, localized testing and repair of valves, or the prompt installation of new Farris ASME certified valves.
- **Mobile Repair Units** - Available at select FAST Centers.

Experienced. Farris Engineering recognizes the value of having pressure relief valve experts as close to the customer as possible. This is accomplished through comprehensive training offered at the factory or on-site. FAST Center sales personnel and technicians are able to provide valuable experience to their customers.

- **Valve Expertise** - Every FAST Center is technically supported by Farris Engineering, a leader in valve design.
- **Factory Trained Technicians** - FAST technicians go through mandatory training consisting of classroom lecture and hands-on practical instruction on Farris Engineering pressure relief valves, repair procedures and applicable codes and standards. The result is a team of highly skilled technicians capable of handling both routine and complex pressure relief valve requirements around the world.
- **OEM parts** - FAST Centers use only OEM parts, restoring valves to OEM specifications. All valves are assembled and tested to ASME standards.

Dedicated. FAST Centers have committed to large investments in inventory, equipment and certifications to better support the customers in their territory.

- **Local Inventory** - Every FAST Center carries a large inventory of new pressure relief valves and spare parts, backed by a web-based global inventory to draw from.
- **ASME Certification** - FAST Centers carry all the required certifications to assemble, set and test Farris valves.
- **VR Certification** - FAST Centers have VR certification issued by The National Board of Boiler and Pressure Vessel Inspectors to effectively and efficiently repair all pressure relief valves where applicable.

Piloting the Way to Precision Control

The innovative, integrally cast, flanged, semi-nozzle valves of the Series 3800 are self-contained units actuated by either the snap-acting or modulating style pilot controls. Valves in the series are certified under Section VIII of the ASME Code for Air, Gas, Vapor, Steam and Liquid Service.

Available in API Orifices D through T as well as full port models, Series 3800 valves are provided with raised face or ring joint inlet flanges from 150# through 2500# ANSI classes with 150#, 300# and selected 600# outlets. Set pressures range from 15 to 6170 psig with temperatures of -450°F to 450°F for standard options. For higher temperature and pressure requirements, please consult the Factory.

All Series 3800 valves have non-flowing pilot controls with 316 stainless steel primary components as standard. The main valve body is carbon steel with 316 stainless steel trim. The main valve is also available in a full 316 stainless steel “S4” option, a NACE standard MR0175 “N1” or “N4” option, Monel® “M4” option, Hastelloy® “H4”option, with other materials available upon request.

Viton® soft goods are standard in both pilot control and main valves. Buna-N, neoprene, ethylene propylene, silicone, PTFE® and Kalrez® soft goods are available as options; contact Factory for more information.

Warranty

All products manufactured by Farris Engineering are warranted free of defects in material and workmanship when used within the range recommended for a period of one year after installation or eighteen months from delivery. When authorized, any defective product may be returned to the factory and if found defective will be repaired or replaced free of charge, solely at the discretion of Farris Engineering, ex-works our factory. No charge for labor or other expense incurred will be allowed, as the liability of Farris Engineering is measured by the refund price of the defective product only. All warranties are based on the product being used within the range recommended and does not cover damages or defects due to normal wear and tear, misuse, alteration or neglect. The purchaser shall determine the suitability of the product for use and assumes all risks and liabilities in connection therewith.

This warranty does not cover the performance of valves tested at site on test equipment that is not to the same technical standard as that used by the manufacturer

Soft Goods Disclaimer

All PORVs use soft goods for their seats and seals. In selecting a soft good, please note the following guidelines:

- Main valve and pilot control soft good selection is based upon set pressure and relieving temperature for non-fire cases. For fire case scenarios, base soft good selection on valve set pressure and operating temperature.
- Final soft goods selection should be chemically compatible with the process fluid.
- Selection of proper soft good material is customer's responsibility.

Principles of Operation – Snap Acting

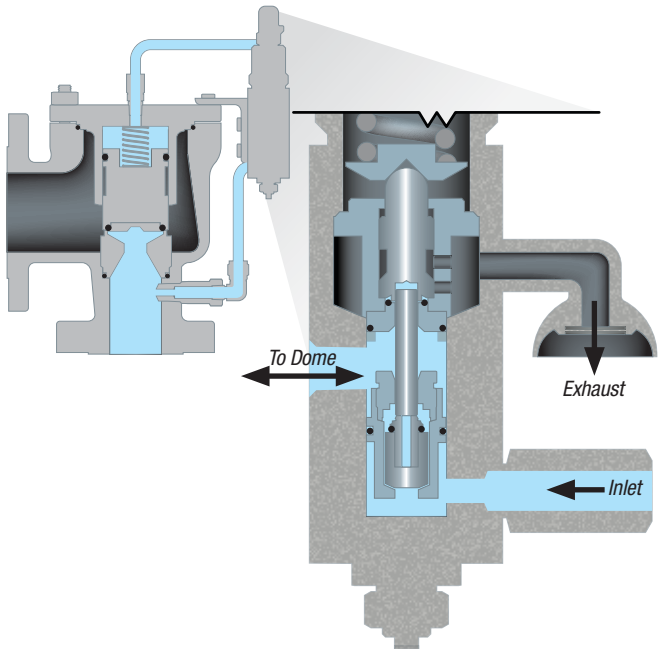
Closed Valve Position

The pilot control valves use system pressure to keep the main valve closed. System pressure is transmitted through the pressure pickup from the inlet of the main valve, through the pilot control and into the dome of the main valve. The system pressure exerts force upon the top of the piston in the dome, holding the piston firmly against the seat on the nozzle in the main valve. The surface area of the piston in the dome of the main valve is greater than the seat area, so the greater the system pressure, the greater the force holding the piston onto the main valve seat. As a result, the pilot operated relief valve gets tighter as the system pressure approaches set pressure.

Relieving Cycle

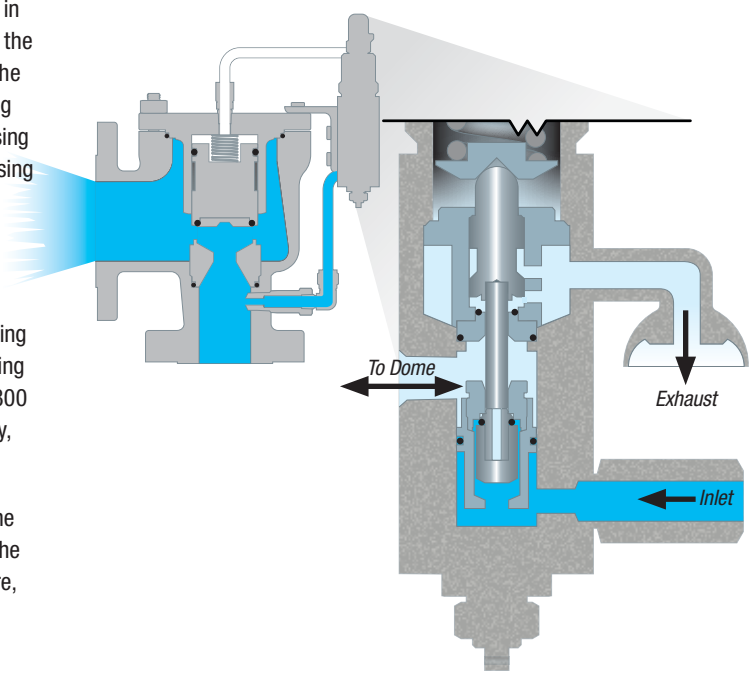
As system pressure reaches set pressure, the force acts upon the surface area of the pilot control disc, overcoming the spring force in the pilot valve, and the pilot valve lifts. As the seat assembly in the pilot control begins to lift, it seals off the flow of pressure to both the vent and the main valve dome. At the same time, the pressure in the dome is released through the pilot vent. Once the pressure in the main valve's dome has been released, the system pressure, acting on the bottom of the piston, will lift the piston and relieve system pressure until normal process conditions are restored.

Re-Closing Cycle



At the point where the system pressure blows down, the spring force in the pilot control overcomes the force of system pressure acting on the pilot control seat assembly, closing the upper seat and reopening the lower seat. This re-establishes flow through the pilot control, allowing system pressure to be redirected back into the main valve dome, closing the main valve. Blowdown can be precisely adjusted externally by raising or lowering the blowdown adjuster position in the pilot control.

Operating Advantages:



Bubble-tight closer to set pressure: Series 3800 valves operate bubble tight at higher operating pressure to set pressure ratios, allowing operators to run very close to the system's maximum allowable working pressure. While protecting the system from overpressure, Series 3800 allows maximum product throughput, increased system profitability, and reduced fugitive emissions.

Unaffected by back pressure: Unlike a direct spring loaded valve, the pilot operated valve's set pressure is not affected by back pressure. The pilot control valve, isolated from the influence of downstream pressure, controls the main valve's opening and closing.

Snap Acting Valve – Closed Position

Snap Acting Valve – Open Position

Principles of Operation – Modulating

Closed Valve Position

At normal operating system pressure, the modulating control performs the same as the snap acting control. The pressure pickup directs system pressure from the inlet of the main valve through to the pilot control inlet port and into the dome of the main valve. The pressure area of the piston in the dome of the main valve is greater than the nozzle seat area. The greater the system pressure, the greater the seating force holding the main valve piston onto the nozzle seat.

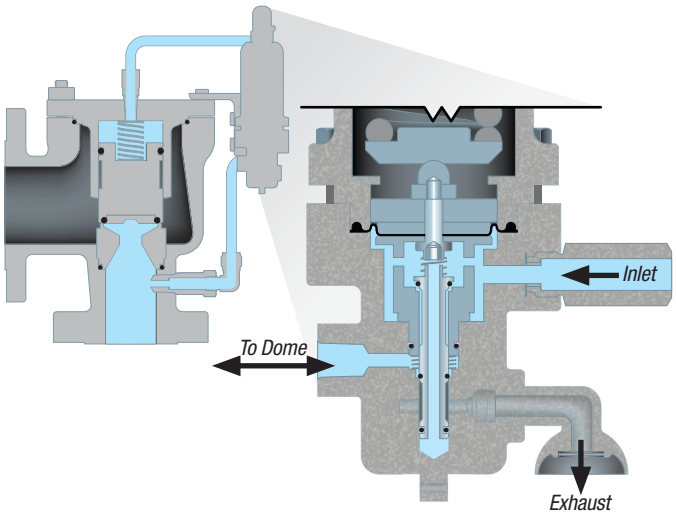
As system pressure increases and approaches the valve's set pressure, the force acting upward on the pilot control increases, overcoming the spring force of the pilot control causing the inlet seat to lift and seal against the floating spool. Pressure is maintained in the dome because the inlet and outlet seals remain closed.

Relieving Cycle

Any further incremental increase in system pressure near set pressure raises both the inlet seat and spool causing the outlet seat seal to crack open. This allows a partial venting of dome pressure in the event of an increase in system pressure. Similarly, any further decrease in system pressure near set pressure lowers both the inlet seat and spool causing the outlet seat seal to close. This allows for a re-pressurizing of the dome when the inlet seat opens at decrease in system pressure.

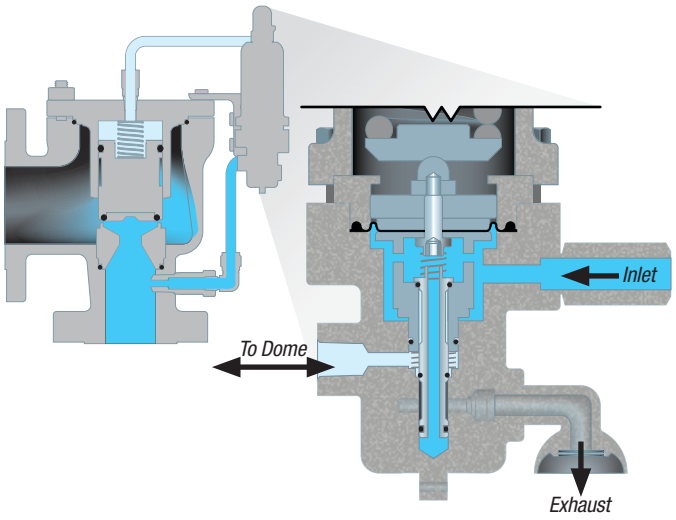
As the system pressure increases to set point, the modulating action of the pilot control, as described above, reduces the pressure in the main valve dome. The further decrease in dome pressure caused by increasing system pressure reduces the seating force to zero and opens the main valve seat to allow flow. The opening of the main valve responds gradually and proportionally to the rise in system pressure, either at or above the set pressure. The main valve will achieve full open and rated flow by 10% overpressure.

Re-Closing Cycle



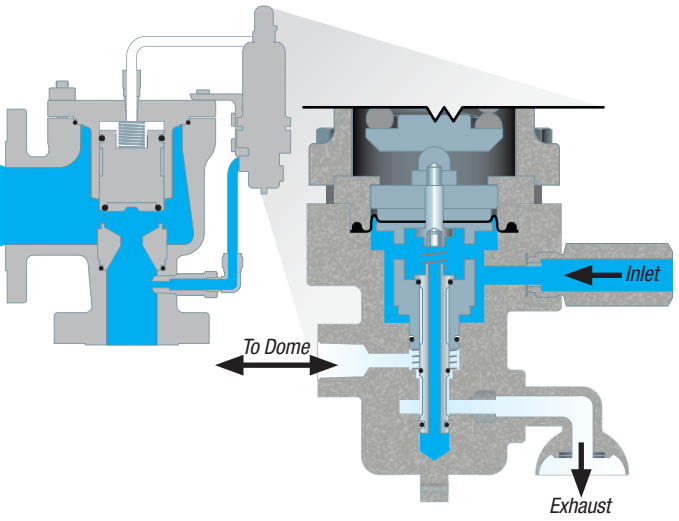
As the system pressure is decreased below set pressure, the spring force in the modulating pilot control overcomes the system pressure acting on the diaphragm/piston assembly and re-closes the outlet seat. The inlet seat then opens and allows system pressure back into the main valve dome, reseating the main valve.

Operating Advantages:



A pilot valve with a modulating control has the same operating advantages as a snap acting pilot control: operates bubble-tight close to set pressure and is unaffected by back pressure.

Minimizes product losses: In addition, the modulating control responds gradually and proportionately to the rise in over pressure, minimizing product losses and reducing reaction forces when the flow requirement is below the maximum rated flow of the valve.



Modulating Valve – Closed Position

Modulating Valve – Partially Open Position

Modulating Valve – Fully Open Position

Numbering System

To simplify the selection and specifying of Farris pressure relief valves, use the following type numbering system. The type numbering system is ideal as the digits which comprise a specific type number have a distinct significance. The digits describe the basic valve series, orifice, seat and internal construction, inlet temperature range, body, and spring material, inlet flange class as well as Code liquid design.

38	D	C	1
Series Number	Orifice Area	Construction	Temperatures & Materials

38

C Elastomer O-Ring Seat & Seals*

T PTFE O-Ring Seat & Seals (Main Valve Only)

*For set pressures above 1480 psig, main seat seal for all valves with 900#, 1500# and 2500# inlet flanges use PTFE.

Designation	Inlet Temperature Range °F	Material	
		Body & Cover	Piston
1	-20 to 450	Carbon Steel	Stainless Steel
2	-20 to + 520	Carbon Steel	PH St. St.
8*	-450 to -50*	Stainless Steel	Stainless Steel

*Use for cyrogenic applications, S4 special material suffix is not required.

Ordering Information

To properly process your order and avoid delay please specify the following:

1. Quantity
2. Inlet and Outlet Size
3. Farris Type Number*
4. Inlet and Outlet Flange Class and Facing
5. Materials of Construction, if other than Standard
6. O-Ring Seal Material (Viton is Standard)
7. Set Pressure*
8. Maximum Inlet Temperature*
9. Allowable Overpressure*
10. Fluid and Fluid State*
11. Backpressure, Superimposed Constant and/or Variable and Built-up*
12. Required Capacity*
13. Physical Properties of Fluid (Molecular Weight, Specific Gravity, etc.)*
14. Accessories, if any required such as:
    a) Manual or Remote Depressurizing
    b) Field Test Connection
    c) Reverse Flow Preventer
    d) Auxiliary Filter
    e) Any other
15. Code Requirements, if any required

*As a customer service we verify your selection and sizing. If this service is desired, you must include this information.

General Notes:
If valve modification or set pressure changes are required, consideration must be given to correct the nameplate and other data.

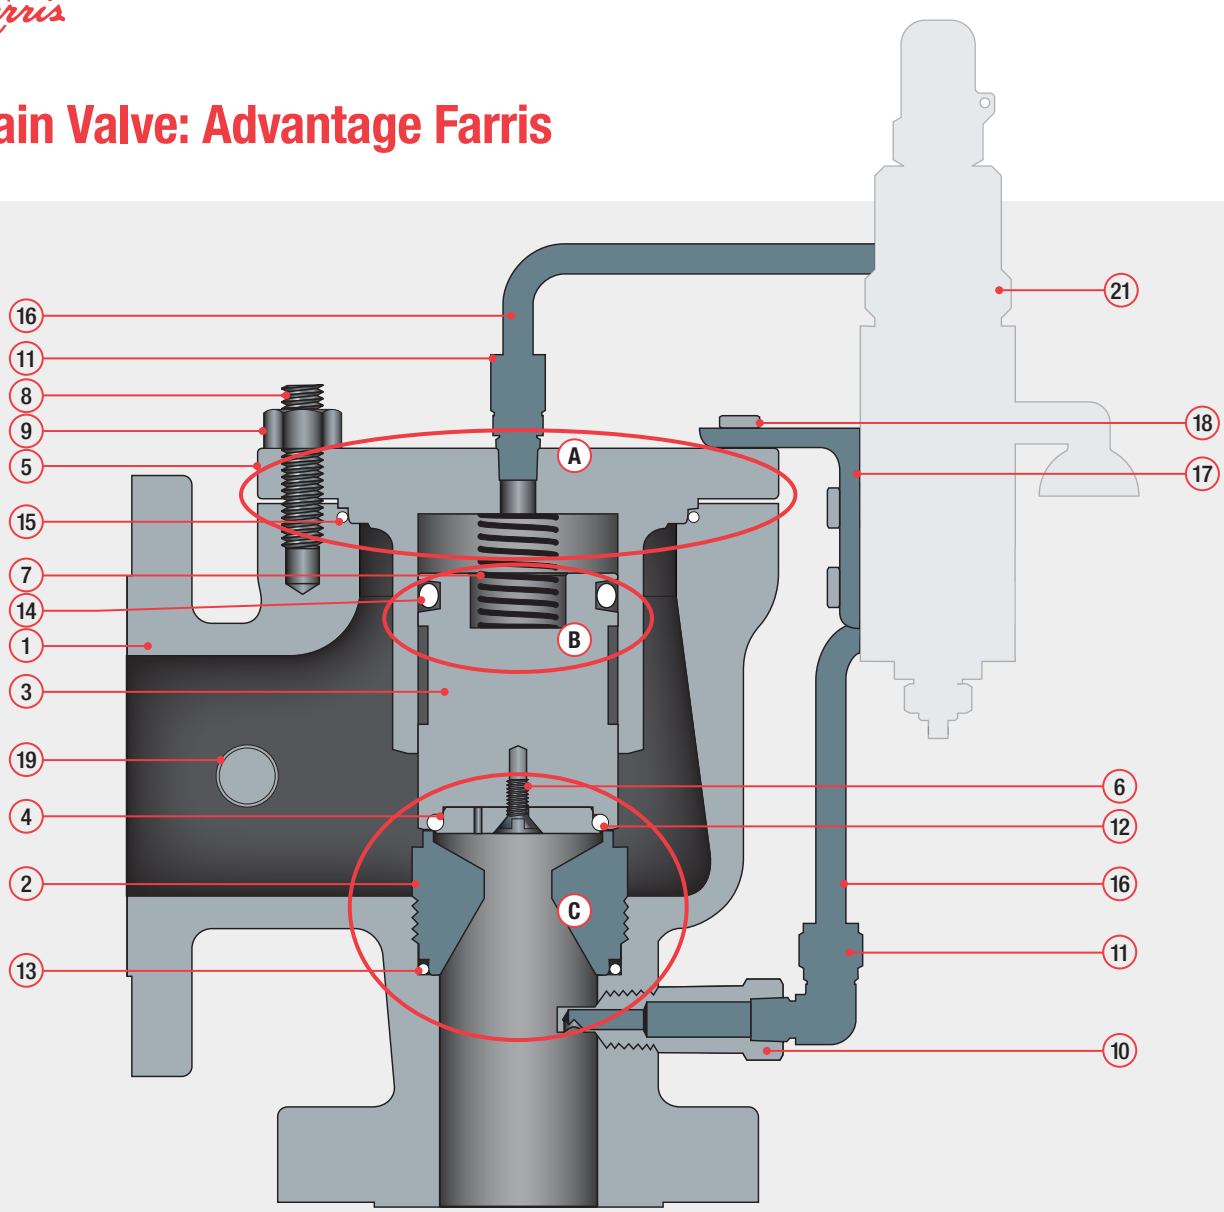
Parts Replacement

Valves: If an exact replacement valve is required, the valve type, size and serial number must be specified to assure proper dimensions and material being supplied. If a specific valve has become obsolete, a recommendation for the current equivalent, if any, will be made.

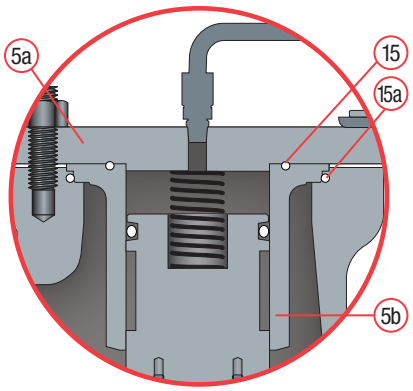
Spare Parts: When ordering parts, use part names as listed in the bills of material in this catalog. Specify valve type, size and serial number. If serial number is not available, the original Farris factory order number will assist in our supplying the proper part and material.

Springs: Order as an assembly to include spring with upper and lower spring buttons. Specify valve type, size, serial number, set pressure and back pressure, if any.



Codes for Common Accessory Combinations

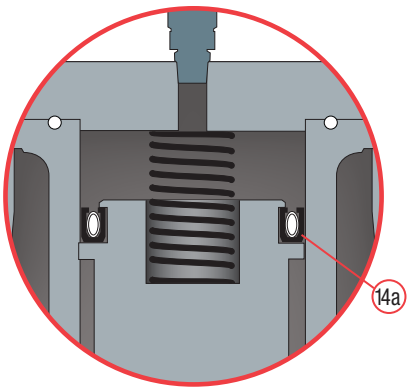
9	Four Auxiliary Functions: Options 4, 5 or F*, 6 & 8
A	Combo – Auxiliary Filter (3) & Field Test Connection (5 or F)*
B	Combo – Field Test Connection (5 or F)* & Reverse Flow Preventer (6)
E	Combo – Auxiliary Filter (3), Field Test Connection (5 or F)* & Reverse Flow Preventer (6)
C	Designation for combinations of options not listed



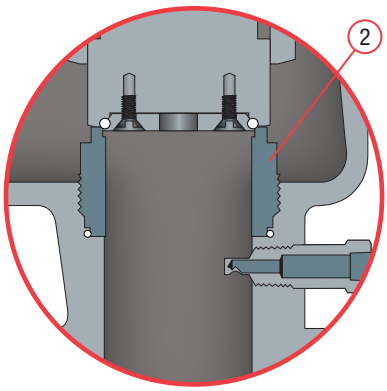
* For Modulating Controls, Field Test Connection w/ Indicator (F) is automatically supplied, unless specified otherwise.

General Notes:
1. Available on 6" and 8" inlet size valves only.
2. Historical designation for special inlet connections. This designation is obsolete.
3. Not available for all valve sizes or pressure classes. Please consult factory.
4. Duplex available upon request, contact factory.

Main Valve: Advantage Farris



A Two Piece Cover and Guide



Valves with 3" inlet and larger

B Energized Piston Seal

Used for cyrogenic, steam and special service

C Full Port Nozzle

Not available for liquid service

ASME UV

Built in conformance to ASME Code Section VIII for Air, Gas, Steam, and Liquid Service.

Convertible Design: the unique convertible design minimizes the number of components and maximizes their interchangeability, reducing parts inventories and overall costs.

Convertible Nozzle: threaded convertible nozzles can be removed and replaced easily without factory service. They can be installed with common tools while the valve is in line, saving time and money.

Fewer Internal Components: the valve design requires no lift stops and the main valve opens fully at set pressure. The orifice area is controlled by the nozzle, eliminating the need for additional parts to restrict lift.

One Piece Body: integrally cast flanges assure the highest material integrity and eliminate problems that may occur with welding.

Full 316 Stainless Steel Trim: this trim is standard and includes nozzle, piston, retainer and guide for long and versatile service life.

Main Valve Soft Seat: unlike metal seated valves which require costly machining and lapping procedures, the main valve soft seat is easily maintained and repaired.

Less Weight, Lower Profile: system pressure provides the seating force in pilot operated relief valves so pilot valves are smaller in size and weight than direct spring loaded valves.

Suitable for NACE Service: for high quality materials of construction that meet NACE MR0103 or MR0175 service, refer to N1 trim for carbon steel body and N4 trim for stainless steel.

Full Port Option: the full port option provides maximum capacity per inlet size.

General Notes:
1. Part used on 3" inlet sizes and larger.
2. Materials certified in compliance with NACE specifications.
3. PTFE for seals required in main valve for temperatures below -20°F. Consult the Factory.
4. PTFE used for Main Seat Seal (item 12) for all valves with 900#, 1500#, and 2500# inlet flanges.
5. We reserve the right to substitute comparable fluorocarbon materials.
6. EPDM is standard offering for NACE; other materials can be selected. Please specify at time of order.
7. Graphite reinforced PTFE with stainless steel spring.
8. Duplex available upon request, contact factory.

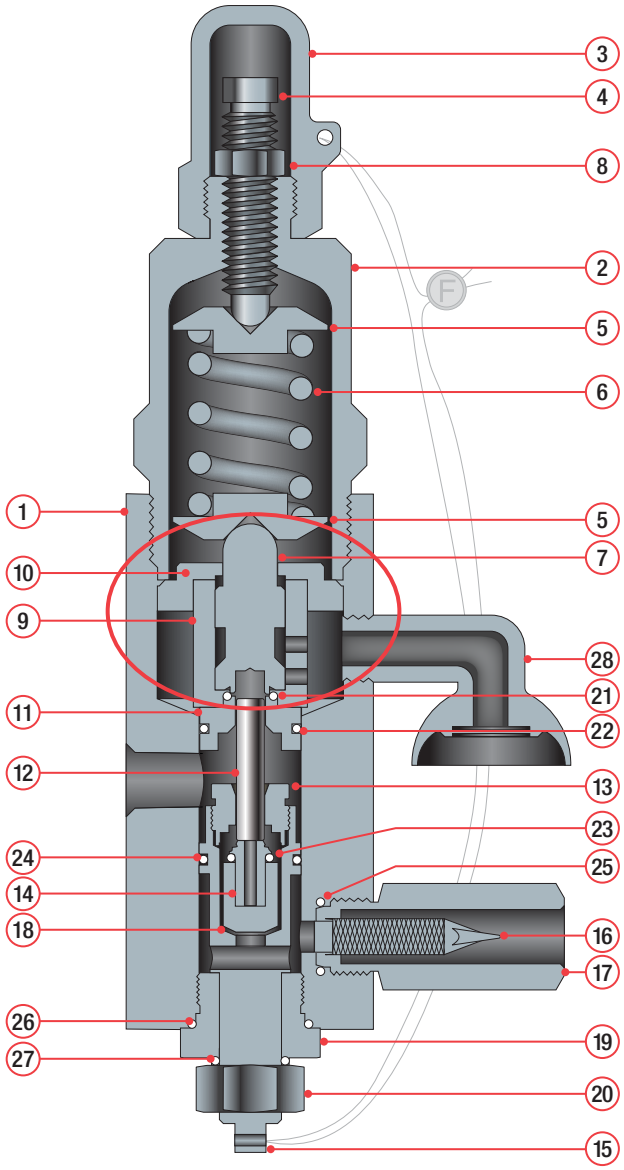
Inconel is a registered trademark of Inco Alloys International, Inc.

Snap Acting Pilot Control Features

Snap-Acting, Non-Flowing: the PCF5 and PCL pilot controls are snap acting and non-flowing, minimizing the flow of process media through the pilot for reduced fugitive emissions and extended valve life.

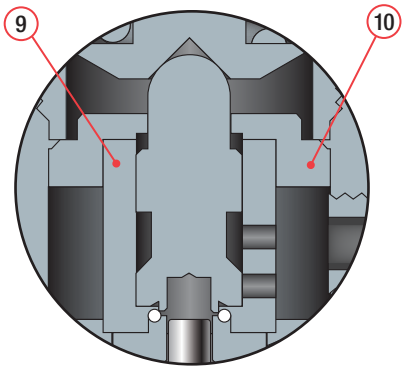
Full 316 Stainless Steel Construction: resists corrosion and extends the life and versatility of the PCF5 and PCL controls.

Adjustable Blowdown: allows setting blowdown at 3% of set pressure so that product loss is minimized and fugitive emissions reduced.



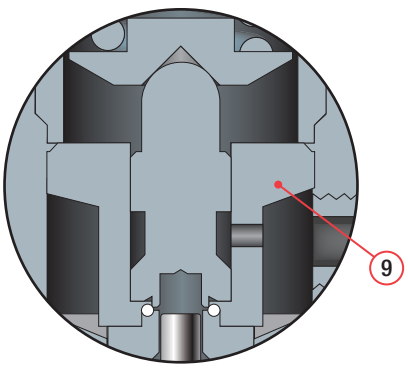
Viton Seats and Seals: these chemical-resistant seals and seats enhance a control's life. Neoprene, ethylene propylene, silicone, and Buna-N soft goods are optional and extend temperature ranges from -65°F to 450°F. Kalrez available when maximum resistance to chemical attack is required. Contact factory for more information.

Set Pressures and Blowdown Set at Pilot Control: in line service, settings and blowdown adjustments are completed quickly and easily without main valve intrusion. Subsequent reduction in product loss and fugitive emissions add to system profitability.



Field Test Capable: the use of a field test connection allows cycling the pilot control without interrupting system protection or removing the valve from the line. Field testing verifies system integrity in accordance with the requirements of the Code.

Remote Sensing Capable: when there is excessive inlet piping losses, or when the main valve must be installed at a different location on the protected system because of its service limitations, the pilot sensing line can be installed separate from the main valve.



Suitable for NACE Service: for high quality materials of construction that meet NACE MR0103 or MR0175 service, refer to N1 trim for carbon steel body and N4 trim for stainless steel.

PCF5(2): Snap Acting Control – Air, Gas, Vapor Service

PCL(3): Snap Acting Control – Liquid Service

ASME UV

Built in conformance to ASME Code Section VIII for Air, Gas, and Liquid Service.
ASME Code stamping not available on full port design in liquid service.

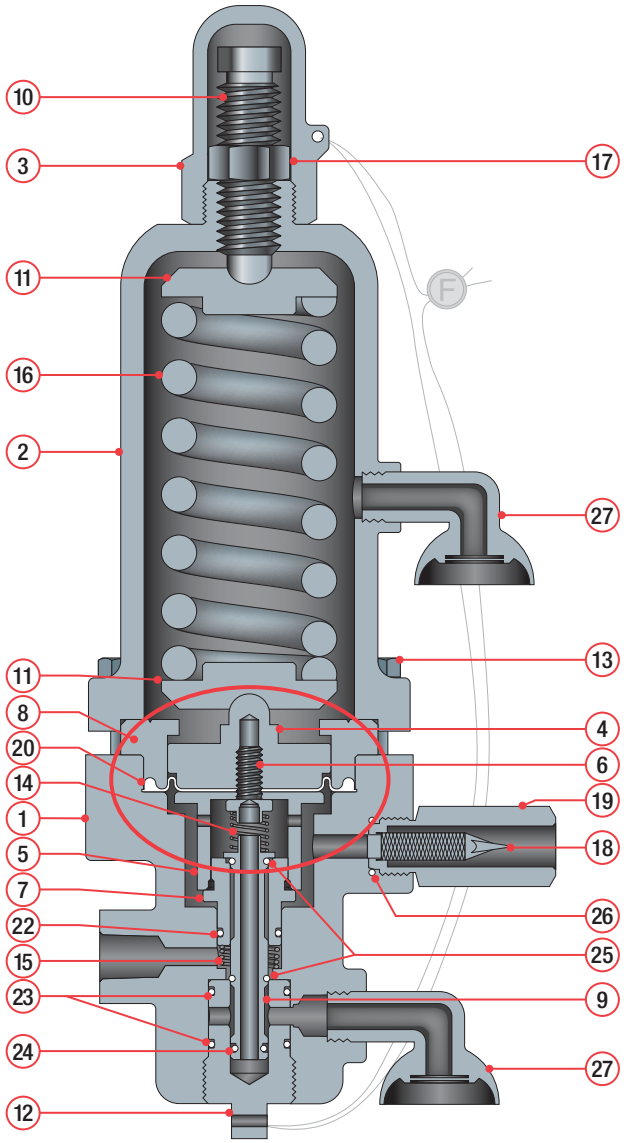
Modulating Pilot Control Features

Modulating, Non-Flowing: the PCM, PCMS and HPCM pilot controls are modulating and non-flowing, minimizing the flow of process media through the pilot for reduced fugitive emissions and extended valve life.

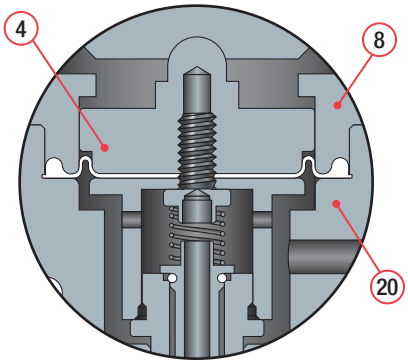
Full 316 Stainless Steel Construction: resists corrosion and extends the operation and versatility of the modulating control.

Blowdown: The modulating controls are a fixed blowdown pilot control with no external adjustment. Depending on fluid service, a blowdown of 3% to 6% is typical.



Viton Seats and Seals: have a wide spectrum of chemical compatibility and temperature range to meet most applications and enhance valve life. Buna-N and ethylene propylene soft goods are optional and extend temperature ranges from -65°F to 450°F. Contact the Farris Factory for more information on other construction materials.

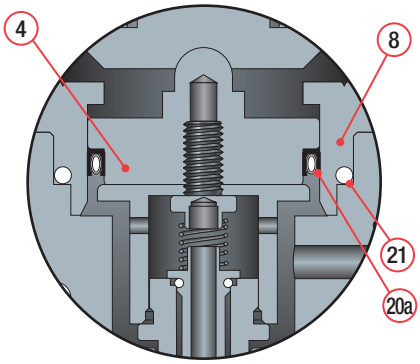
Set Pressure Set at Pilot Control: in-line service and setting adjustments are done quickly and easily without main valve intrusion. Subsequent reduction in product loss and fugitive emissions adds to the system's profitability.



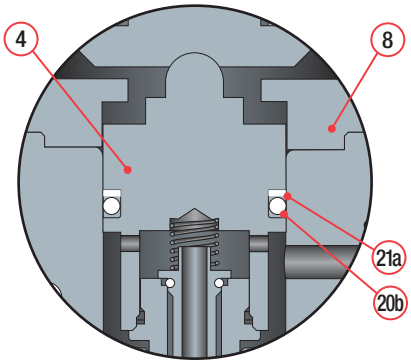
Field Test Capable: using a field test connection allows cycling the pilot control without interrupting system protection or removing the valve from the line. Field testing verifies system integrity in accordance with the ASME Code.

Remote Sensing Capable: when there is excessive inlet piping losses, or when the main valve must be installed at a different location on the protected system because of its service limitations, the pilot sensing line can be installed separate from the main valve.

Suitable for NACE Service: for high quality materials of construction that meet NACE MR0103 or MR0175 service, refer to N1 trim for carbon steel body and N4 trim for stainless steel.



PCM(4): Modulating Control – 15 to 740 psig



Air, Gas, Vapor and Liquid Service

PCMS(5): Modulating Control – 15 to 740 psig

Air, Gas, Vapor, Liquid and Steam Service

HPCM(6): Modulating Control – 740 to 2220 psig

Air, Gas, Vapor and Liquid Service

ASME UV

Built in conformance to ASME Code Section VIII for Air, Gas, Steam, and Liquid Service.
ASME Code stamping not available on full port design in liquid service.

General Notes:

1. Standard elastomer is Viton which is suitable to a maximum temperature of 450°F. For temperatures above 450°F the o-ring seals must be specified as Kalrez.
2. The 300# and 600# flanges have identical drilling with flange thickness equal to the 600# class.
3. For liquid service applications, add "L" to the end of the base type number for valves with standard size connections. Change the "X" to a "Y" for valves with oversize connections and change "D" to an "E" for valves with dual outlet. Examples: 38FC10L-120, 38FC10Y-120, 38TC10E-120.

General Notes:
1. Standard elastomer is Viton which is suitable to a maximum temperature of 450°F. For temperatures above 450°F the o-ring seals must be specified as Kalrez.
2. The 300# and 600# flanges have identical drilling with flange thickness equal to the 600# class.
3. Valves only certified for air, gas, vapor and steam service.
4. Valves with ring joint inlet connections available. Consult the Factory for final dimensions.
5. A 1" x 2" valve with an "G" orifice is only available when configured with a remote sensing option.

General Notes:
1. A 1" x 2" valve with an "A" orifice is only available when configured with a remote sensing option.
2. The 300# and 600# flanges have identical drilling with flange thickness equal to the 600# class.
3. Valves with ring joint inlet connections available. Consult the Factory for final dimensions.
4. Dual outlets only available for 6" and 8" inlet valves.
5. Standard elastomer is Viton which is suitable to a maximum temperature of 450°F. For temperatures above 450°F the o-ring seals must be specified as Kalrez.
6. Full port orifices require that inlet piping have a flow area equal to or greater than the full port orifice flow area.
7. Valves only certified for air, gas, vapor and steam service.

General Notes:

1. Capacities at 30 PSIG and below are based on 3 PSI overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for air, gas, and steam is 0.954 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for air, gas, and steam service is 0.859.

Air Capacities – 3800 Series: 10% Overpressure, Full Port

ASME Pressure Vessel Code (UV) – Capacities in Standard Cubic Feet Per Minute at 60°F – U.S. Customary Units

General Notes:

1. Capacities at 30 PSIG and below are based on 3 PSI overpressure.
2. For sizing purposes the coefficient of discharge, K for air, gas, and steam is 0.801
3. Full port orifices require that inlet piping have a flow area equal to or greater than the full port orifice flow area.

Steam Capacities – 3800 Series: 10% Overpressure, API

General Notes:

1. Capacities at 30 PSIG and below are based on 3 PSI overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for air, gas, and steam is 0.954 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for air, gas, and steam service is 0.859.
3. For full port sizing purposes the coefficient of discharge, K for air, gas, and steam is 0.801.
4. Full port orifices require that inlet piping have a flow area equal to or greater than the full port orifice flow area.

Water Capacities – 3800 Series: 10% Overpressure, API

General Notes:

1. Capacities at 30 PSIG and below are based on 3 PSI overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for liquids is 0.869 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for water is 0.782.
3 Values in this table assume no backpressure.

General Notes:

1. Capacities at 2.0 Barg set pressure and below are based on 0.2 Bar overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for air, gas, and steam is 0.954 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for air, gas, and steam service is 0.859.

Air Capacities – 3800 Series: 10% Overpressure, Full Port

ASME Pressure Vessel Code (UV) – Capacities in Standard Cubic Meters Per Minute at 15.6°C – Metric Units

General Notes:

1. Capacities at 2.0 Barg set pressure and below are based on 0.2 Bar overpressure.
2. For sizing purposes the coefficient of discharge, K_d for air, gas, and steam is 0.801.
3. Full port orifices require that inlet piping have a flow area equal to or greater than the full port orifice flow area.

General Notes:

1. Capacities at 2.0 Barg set pressure and below are based on 0.2 Bar overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for air, gas, and steam is 0.954 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for air, gas, and steam service is 0.859.
3. For full port sizing purposes the coefficient of discharge, K for air, gas, and steam is 0.801.
4. Full port orifices require that inlet piping have a flow area equal to or greater than the full port orifice flow area.

General Notes:

1. Capacities at 2.0 Barg set pressure and below are based on 0.2 Bar overpressure.
2. For sizing purposes the effective coefficient of discharge, K_d for liquids is 0.869 when sizing using the API effective areas. When sizing using the ASME actual areas, the certified coefficient of discharge K for water is 0.782.
3. Values in this table assume no backpressure.

Optional Accessories

A full line of accessories is available to meet your service requirements.

Dual Pilot Controls

Auxiliary Filters

Manual Depressurizing

Dual Pilot Controls

The dual pilot arrangement permits switching from an active control to a back-up control, ensuring uninterrupted pressure relief protection. The original, active control can be removed from the main valve for checking or maintenance purposes.

The spare pilot can be in place during operation or be installed just prior to switch over. When the pilot controls are subjected to corrosive service that can require more frequent maintenance cycles, this option maximizes in-service time of the PORV and increases the integrity level of the valve. Select Option #2 from page 5.

Auxiliary Filters

All pilot controls are manufactured with an internal filter that reduces particles in the process stream, as these particles can impede the operation of the pilot valve. For services where particulates are present in the process media, additional filtration may be required. Auxiliary filters for the pilot valve sensing line are available to complement the internal filter. This filter is mounted upstream to the pilot's internal filter, reducing the amount of particles that can enter the pilot. As our pilot valves are non-flowing, the life cycle of the filter is dependent on the valve size, particle size and the valve usage. Select Option #3 from page 5.

Manual or Remote Depressurizing

Pilot operated relief valves potentially need an option to manually or remotely depressurize before the normal overpressure settings have been reached. In addition, this option allows for testing the main valve function without cycling the pilot control. It also allows for the pilot valve, in conjunction with other valves, to provide emergency reduction of system pressure due to potential safety situations. The main valve can be cycled to the open position by venting the pressure in the dome above the piston. A manual valve option will mount directly on the main valve, which allows for manual depressurizing of the dome. Alternately, a solenoid valve will cycle the main valve remotely. Neither the manual nor remote blowdown system will interfere with the normal overpressure protection provided by the main valve and pilot. Select Options #4 or #8 from page 5.

Remote Depressurizing

Field Test Connection

Field Test Connection with Indicator

Reverse Flow Preventer

Field Test Connection or Field Test Connection with Indicator

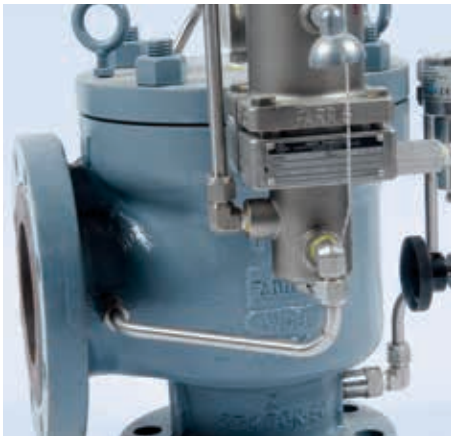
With the addition of a field test connection, the set pressure of Farris pilot operated relief valves can be verified without interrupting system protection and does not require overpressure of the system. An auxiliary source of pressure, such as a nitrogen bottle, is connected to the pilot sensing line through a stop valve. Increasing pressure is applied through the field test connection to the pilot control, simulating the increase in system pressure. A check valve restricts the source pressure from back flowing into the main valve inlet. When the applied pressure reaches set point, the pilot control reacts as if it were sensing overpressure via the main valve sensing line. When this occurs, the auxiliary pressure reading can be compared to the nameplate value to verify set pressure. For snap acting valves, both
the pilot and main valves will cycle at set pressure. For modulating valves, the modulating controls will crack slightly depending on current system pressure, the main valve may briefly cycle. To more accurately establish the modulating pilot relief valve's set pressure, a field test connection with indicator is recommended.

The field test connection with indicator provides positive verification that set pressure has been reached. The set pressure for the current modulating relief valves is defined as the point when dome pressure is reduced to 70% of set pressure. The field test indicator is activated when the applied pressure reaches the valve's set point and at this time, can be compared to nameplate value. Select Option #5 or F from page 5.

Reverse Flow Preventer

Reverse flow in a pilot relief valve can occur in systems where back pressure exceeds system pressure or where a vacuum can form at the inlet. In both cases a reverse differential pressure exists and it is possible for the main valve to open and allow flow from the discharge system to enter the inlet side.

A reverse flow preventer assures that the correct pressure differential is maintained and the main valve remains closed. A reverse flow preventer introduces outlet pressure into the dome of the main valve, keeping the piston firmly seated onto the nozzle, overcoming the effect of a reverse differential. This option also prevents reverse flow through the pilot control via the pilot sense line into the upstream side of the system. Select Option #6 from page 5.



Remote Sensing (no photo)

One of the causes of excessive chatter in a PRV is significant pressure losses on the inlet side during a relief episode. Recommended practice is to limit the non-recoverable (friction) losses to less than 3% of set pressure. When this cannot be accomplished with piping design changes, a pilot operated relief valve equipped with a remote sense line can mitigate this issue. This arrangement allows connecting the pilot sensing line at a location close to the equipment being protected, yet not affected by the inlet pipe pressure drop, thereby avoiding chatter, damage and unstable relieving flow. Select Option R from page 5.

Optional Accessories, continued

Pressure Spike Snubbers

Discharge to Outlet

Valve Lift Indicator

Pressure Spike Snubbers

Rapid pressure spikes often occur in systems with positive displacement pumps or compressors. When these pressure spikes approach or exceed the set pressure of the valve, the pilot control may actuate and cause a valve to open prematurely. A pressure spike snubber installed in the pilot valve sensing line will eliminate the negative effects of pressure pulsation. It assures that the pilot valve is sensing and reacting to mean pressure and not to instantaneous pressure spikes. Select Option #7 from page 5.

Discharge to Outlet

In order for a pilot operated relief valve to open, the system pressure retained in the main valve dome needs to be released. This small volume of process fluid in the dome is typically released to the atmosphere via the pilot control discharge port. This is true whether it is a snap-acting or a modulating pilot control.

Normally, the end user can accept this small amount of product loss and fugitive emissions when the process fluid is gaseous. However, if the process fluid is a liquid, flammable, or possibly hazardous, then the release to atmosphere may need to be minimized and/or eliminated.

The conventional solution is to pipe the discharge of the pilot control to a safe location or atmospheric collection system. This is not always possible or practical. In these cases, piping the modulating pilot control discharge directly to the main valve outlet is the solution. The design of the modulating pilot control features a balanced relief chamber that neutralizes the effects of back pressure to set pressure similar to that of a bellows-style spring loaded valve. Therefore the discharge for a modulating pilot control can be piped directly to the main valve outlet and is recommended for liquid applications.

This option is only available with the modulating pilot control and must be specified at the time of order. Select Option V from page 5.

Valve Lift Indicator

A valve lift indicator allows the operator to know when the pilot operated relief valve has opened. This auxiliary option consists of a differential pressure switch as the indicator. The switch is mounted to the dome of the main valve. When the dome pressure is reduced sufficiently so that the main valve opens, the switch is actuated, allowing a signal to be sent to a remote location. In order to supply this option, please be prepared to supply information regarding the electrical source, switch contact style, and switch rating, enclosure and hazard rating. This option will be designated under SP – special construction.

General Notes:
1. Materials of construction for the accessories will remain consistent with the main valve and pilot control constructions. Please consult factory for details.
2. Customer will need to provide supplemental information to specify this option.
3. Field test connection with indicator is the recommended option for modulating pilot control applications.
4. Complete details regarding electrical source, switch contact style, switch rating, enclosure and hazard rating must be provided by customer.
5. This option is recommended for modulating controls when process fluid is a liquid, flammable, or possibly hazardous.

Sizing Information

The following equations are presented in U.S. customary units. For metric equivalents please consult our sizing software, SizeMaster at **www.avrasoft.com/sizemaster.**

General Equations

Before beginning any calculations, it is necessary to establish the general category of the pressure relief valve to be used. This section covers pilot operated relief valves.

Given the rate of fluid flow to be relieved, the usual procedure is to first calculate the minimum area required in the valve orifice for the conditions contained in one of the following equations. In the case of steam, air or water, the selection of an orifice may be made directly from the capacity tables.

The second step is to select the specific type of valve that meets the pressure and temperature requirements.

General equations are given first, to identify the basic terms that correlate with ASME Pressure Vessel Code, Section VIII.

Since these equations are conservative, it is recommended that computations of relieving loads avoid cascading of safety factors or multiple contingencies beyond the reasonable flow needed to protect the pressure vessel.

Orifice Area Calculations	Constant Back Pressure
VAPORS or GASES – Lbs./hr.: $A = \frac{W\sqrt{T}\sqrt{Z}}{C K_d P \sqrt{M} K_b}$	K_b = 1 when back pressure is below 55% of abs. relieving pressure.
VAPORS or GASES – S.C.F.M.: $A = \frac{V\sqrt{G}\sqrt{T}\sqrt{Z}}{1.175\, C K_d P K_b}$	K_b = 1 when back pressure is below 55% of abs. relieving pressure.
STEAM – Lbs./hr.: $A = \frac{W_s}{51.5 K_d P K_b K_{sh} K_n}$	K_b = 1 when back pressure is below 55% of abs. relieving pressure. K_{sh} = 1 for Sat. Steam
AIR – S.C.F.M.: $A = \frac{V_a\sqrt{T}}{418 K_d P K_b}$	K_b = 1 when back pressure is below 55% of abs. relieving pressure.
LIQUIDS – 3800L Series, G.P.M., ASME Code: $A = \frac{V_L\sqrt{G}}{38.0 K_d\sqrt{\Delta P} K_u}$	K_u = 1 at normal viscosities

Nomenclature

A = Required orifice area in square inches. This value may be compared with the API effective areas included in this catalog and defined in ANSI/API Standard 526 or the ASME actual area.

W = Required vapor capacity in pounds per hour.

W_s = Required steam capacity in pounds per hour.

V = Required gas capacity in SCFM.

V_L = Required liquid capacity in U.S. gallons per minute.

G = Specific gravity of gas (air = 1) or specific gravity of liquid (water = 1) at actual discharge temperature.

M = Average molecular weight of vapor.

P = Relieving pressure in psia = set pressure + over pressure + 14.7 Minimum overpressure is 10% or 3 psi, whichever is greater.

P_1 = Set pressure at inlet, psig.

P_2 = Back pressure at outlet, psig.

ΔP = Set pressure + overpressure, psig – back pressure, psig. At 10% overpressure $\Delta P = 1.1P_1 - P_2$. Below 30 psig set, $\Delta P = P_1 + 3 - P_2$.

T = Inlet temperature absolute (°F+460).

Z = Compressibility factor corresponding to T and P (if this factor is not available, compressibility correction can be safely ignored by using a value of Z = 1.0).

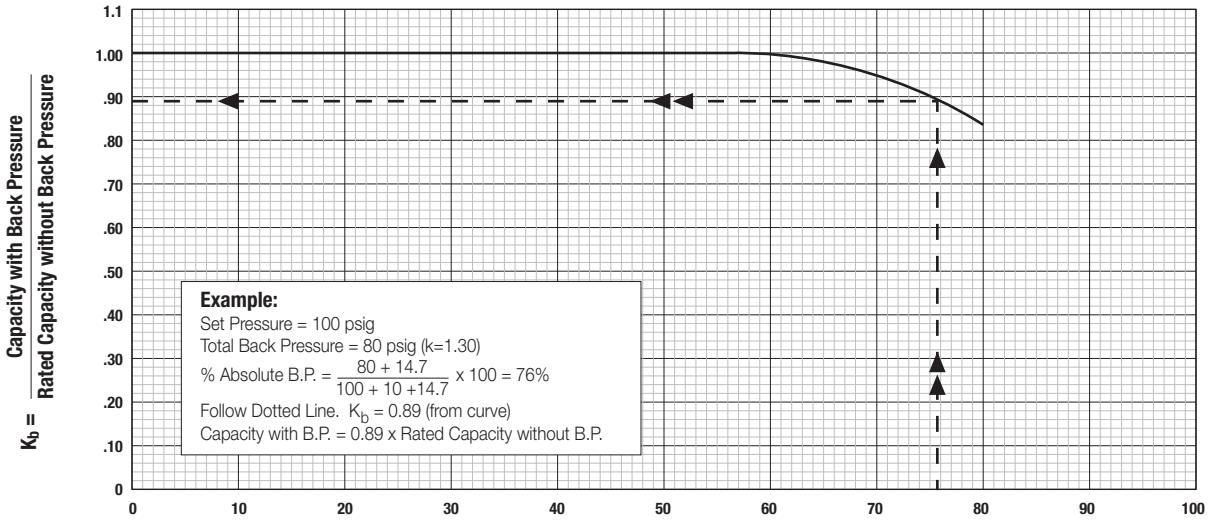
C = Gas or vapor flow constant.

k = Ratio of specific heats, C_p/C_v. This value is constant for an ideal gas. If this ratio is unknown, the value k = 1.001, C = 315 will result in a safe valve size. Isentropic coefficient n maybe used instead of k.

K_b = Vapor or gas flow correction factor for back pressures above critical pressure. See curve.

K_u = Liquid viscosity correction factor.

K_{sh} = Steam superheat correction factor. $K_{sh} = 1$ for saturated steam.



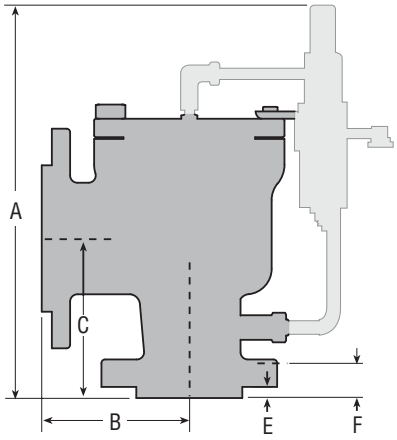
K_n = Napier steam correction factor for set pressures between 1500 and 2900 psig.

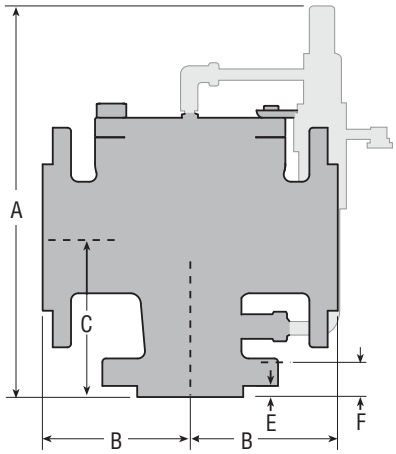
K_d = Coefficient of Discharge, where:

Service Fluid	K_d when sizing using	
	API Effective Areas	ASME Actual Areas
Air, Steam, Vapor & Gas (API nozzles)	0.954	0.859
Liquid (API nozzles)	0.869	0.782
Air, Steam, Vapor & Gas (Full Port nozzles)	n/a	0.801

Sizing Factors for Vapors and Gases

Back Pressure Sizing Factor K_b





$$\% \text{ Absolute Back Pressure} = \frac{\text{Back Pressure, psia}}{\text{Set Pressure + Over Pressure, psia}} \text{ X } 100$$

Superheat Steam Correction Factor

General Notes:

1. For liquid service valves with standard size connections (L in the type number), use the standard type number dimensions, i.e. 38HC10-120. For liquid service valves with oversize connections (Y in the type number), use the oversize type number dimensions, i.e. 38DC10X-120.
2. Valves with ring joint inlet connections available. Consult the Factory for final dimensions.
3. For modulating valves, add 2-1/2" (64 mm) to the A dimension.
4. F dimension meets or exceeds ANSI thickness requirement.
5. A 1" x 2" valve with a "G" orifice is only available with a remote sensing option.

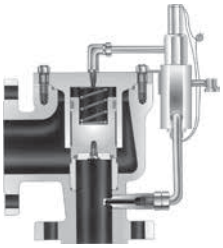
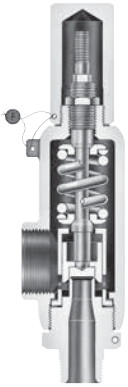
General Notes:
1. A 1" x 2" valve with an "A" orifice is only available when configured with a remote sensing option.
2. Valves with ring joint inlet connections available. Consult the Factory for final dimensions.
3. For modulating valves, add 2-1/2" (64 mm) to the A dimension.
4. F dimension meets or exceeds ANSI thickness requirement.
5. Full port orifices require that inlet piping have a flow area equal to or greater than the Full port orifice flow area.



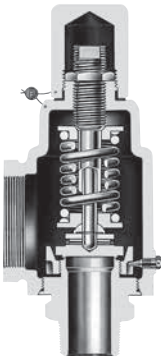
Farris Engineering Products

Process Pressure Relief Valves



SERIES 2600/2600L

- ASME NB Certified: Air, Steam & Water
- Sizes: 1" x 2" to 20" x 24"
- Pressure Range: 15 psig to 6000 psig
- Temperature Range: -450°F to +1500°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Options: Balanced Bellows, O-Ring Seat, Open Bonnet
- CE Approved

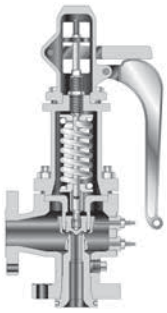


SERIES 3800 Pilot Operated

- ASME NB Certified: Air, Steam & Water
- Sizes: 1" x 2" to 12" x 16"
- Pressure Range: 15 psig to 6170 psig
- Temperature Range: -450°F to +500°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Actuation: Snap and Modulating Controls
- Options: Field Test Connections, Reverse Flow Preventer, Remote Depressurizing & Auxiliary Filters
- CE Approved

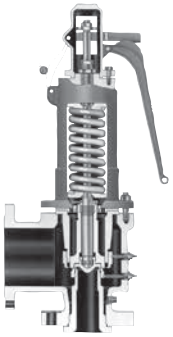
SERIES 2700

- ASME NB Certified: Air, Steam & Water
- Sizes: ½" x 1" to 1½" x 2½"
- Pressure Range: 15 psig to 6500 psig
- Temperature Range: -450°F to +750°F
- Materials*: Carbon Steel, Stainless Steel, Monel & Hastelloy C
- Options: Balanced Design, O-Ring Seats, Flanged, Socket Weld, Welding Nipple, & Sanitary Connections
- CE Approved



SERIES 2850/2856

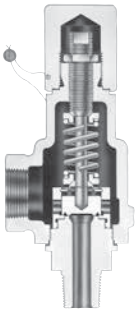
- ASME NB Certified: Air & Steam
- Sizes: ¾" x 1" to 1½" x 2" (2850) ¾" x 1¼" to 2" x 3" (2856)
- Pressure Range: 15 psig to 300 psig
- Temperature Range: -20° F to +750°F (2850) -450° F to +400°F (2856)
- Materials: Stainless Steel Body & Trim Steel Bonnet (2850) Brass Body & Trim, Bronze Bonnet (2856)



*Other materials available upon request. Please consult the factory.

Steam Safety Valves

SERIES 4200



- ASME NB Section I & VIII Certified: Steam & Air
- Sizes 1¼" x 1½" to 6" x 8"
- Pressure Range: 15 psig to 1000 psig
- Temperature Range: -20°F to +1000°F
- Materials: Carbon Steel, Stainless Steel, Chrome-Moly
- Options: Test Gag
- CE Approved

SERIES 6400/6600

- ASME NB Section I & VIII Certified: Steam & Air
- Sizes: 1" x 2" to 4" x 6"
- Pressure Range: 15 psig to 1500 psig
- Temperature Range: -20°F to +1000°F
- Materials: Carbon Steel, Stainless Steel, Chrome-Moly
- Options: Closed Bonnet (6600) & Test Gag

Special Purpose Pressure Relief Valves

SERIES 1890/1896M

- ASME NB Certified: Air, Steam & Water
- Sizes: ½" x 1" & ¾" x 1" (1890) ½" x ¾" & ¾" x ¾" (1896M)
- Pressure Range: 15 psig to 800 psig (1890) 15 psig to 300 psig (1896M)
- Temperature Range: -20°F to +750°F (1890) -450°F to +400°F (1896M)
- Materials: Stainless Steel Body & Trim (1890) Brass Body & Trim, Bronze Bonnet (1896M)

Farris Engineering Products and Services

The following is a list of Farris approvals currently on record:

- ASME “V”, “UV” and “NV”
- National Board “NB” approval
- ISO 9001-2008
- US Coast Guard
- PED 97/23/EC (European Pressure Equipment Directive)
- ATEX 94/9/EC (European Potentially Explosive Atmospheres)
- B51 CRN
- China Safety Quality License
- Russian GOST-R and RTN (Russian Certification and Permits)
- First Point Assesment Limited
- Nuclear – 10 CFR 50 Appendix B, NCA-4000, NQA-1, N285.0

Process Pressure Relief Valves

Series 2600	ASME NB Certified for Air, Steam and Water
Series 3800	ASME NB Certified for Air, Steam and Water
Series 2700	ASME NB Certified for Air, Steam and Water
Series 1890/1896M	ASME NB Certified for Air, Steam and Water
Series 2850/2856	ASME NB Certified for Air and Steam
Series 88/89	ASME NB Certified for Air and Steam
Series 570	ASME NB Certified for Air and Steam
Series 69	Liquid Service
Series 140	Air Service

Steam Safety Valves

Series 4200	ASME NB Certified for Steam – Section I & VIII
Series 6400/6600	ASME NB Certified for Steam – Section I & VIII
Series 560	ASME NB Certified for Steam – Section I & VIII

Nuclear Pressure Relief Valves

Series 4700/4700L	ASME NB Section III, Division 1 Class I, II & III
Series 2700/3700	ASME NB Section III, Division 1 Class I, II & III
Series 2600/2600L	ASME NB Section III, Division 1 Class I, II & III
Series 3800	ASME NB Section III, Division 1 Class I, II & III

Farris Product Line Scope

Series	ASME Certification			Pressure Equipment Directive	
	Section	Test Fluids	Code Symbol	Compliance	Directive Mark
2600	Section VIII	Air, Steam & Water	UV	yes	CE
2600L	Section VIII	Water & Air	UV	yes	CE
2700	Section VIII	Air, Steam & Water	UV	yes	CE
3800	Section VIII	Air, Steam & Water	UV	yes	CE
4200	Sections I & VIII	Air & Steam	V UV	yes	CE
6400	Sections I & VIII	Air & Steam	V UV	no	Not Available
1890	Section VIII	Air, Steam, & Water	UV	no	
1896M	Section VIII	Air, Steam, & Water	UV	no	
2850*	Section VIII	Air & Steam	UV	no	
2856*	Section VIII	Air & Steam	UV	no	

*Available for non-ASME code liquid applications.

General Notes
1. All valves are stamped with the appropriate ASME Code “V” or “UV” stamp as noted above.
2. In addition to the appropriate ASME Code stamp, valves shipped into the European market are marked with the “CE” symbol indicating compliance with the Pressure Equipment Directive.
3. Valves may also be supplied to ASME Code Section III, “NV” stamp.

Safety Warning & Instruction System

You will find safety warnings and instruction labels in this manual. These have been included to ensure your safety and must be followed. Safety labels are vertically oriented rectangles as shown in the samples below. These labels consist of three panels inside a border. Each safety label will communicate the following three key pieces of information. This information is communicated using narrative and pictorials.

- The nature and severity of the hazard
- The consequence of the hazard, if not avoided
- The precautions and measures required to avoid the hazard.

The top panel of the safety label illustrates the signal word (DANGER, WARNING, or CAUTION) which communicates the severity of the hazard, per the explanations to the right. The center panel contains a pictorial which communicates the nature of the hazard, and the possible consequence of hazard if not avoided. In some cases, the pictorial may depict the precautions or measures required to avoid the hazard. The bottom panel will then contain the remaining narrative information needed to ensure all three key pieces of information have been conveyed.

DANGER:
Indicates hazards which, if not avoided, will result in serious injury or death.

WARNING:
Indicates hazards which, if not avoided, could result in serious injury or death.

CAUTION:
Indicates hazards which, if not avoided, could result in minor or moderate injury.

NOTICE:
"NOTICE" is reserved for instructions given to prevent property, product, or environmental harm.

SAFETY INSTRUCTIONS:
"SAFETY INSTRUCTIONS" indicates processes or procedures recommended to ensure safety.

General Safety Instructions

These general installation and maintenance instructions are provided by Farris Engineering, a Curtiss-Wright Flow Control Company, to its customers as general guidance for the handling, storage, and installation of Farris valves. Pressure relief valves are critical components in pressurized systems to ensure the safety of personnel and property. Always follow all manufacturer and industry standard recommendations relating to proper installation, testing, maintenance, and reconditioning.

This should not be considered an exhaustive manual and it does not cover the full maintenance and repair of valves. Certain configurations, applications, and usages may not be covered. All information presented in this manual is subject to change without notice. If there is specific information needed that is not covered in this manual, the customer is advised to contact Farris. The purchaser should also contact Farris regarding any possible changes in information or specifications. Please use the contact information on the back of this manual.

To ensure reliable and safe operation, installation, testing, maintenance, adjustment, and repair of Farris valves, these activities shall only be performed by qualified personnel having the required skills and training. No repair, assembly, adjustment or testing performed by individuals other than Farris-authorized representatives shall be covered by the warranty extended by Farris to its customers. All applicable regulations, directives, codes and standards shall be adhered to when performing these activities. Failure to follow proper test procedures or failure to use proper test equipment will lead to incorrect test results, damage to the valve and will invalidate the warranty.

Likewise, use of parts in any maintenance or repair activity other than factory-supplied OEM parts will invalidate the warranty extended by Farris to its customers. Incorrect selection or application of Farris valves on the part of the customer is not covered by the warranty extended by Farris to its customers.

These general instructions have been provided not only to ensure the proper installation and maintenance of Farris pressure relief valves, but also to provide for the safety of personnel who handle our products. Failure to follow these procedures could result in severe bodily harm or even death.

General Safety Instructions, cont.

All possible hazards may not be identified in this manual. Conduct your own safety risk assessment given your specific system, environment, and configuration, and ensure proper control procedures are in place to prevent personal injury or illness and property, product or environmental harm.

DANGER

- When the valve is under pressure, do not place any part of your body near or in the path of the outlet of the main valve or other discharge areas. Doing so will result in serious injury or death upon valve discharge.
- If a test gag is provided with the valve, it must be removed prior to installation. Failure to do so will result in equipment failure, serious injury or death in the instance of an overpressure event.

WARNING

- Never attempt to remove, adjust, maintain, or repair a pressure relief valve while it is installed in a pressurized system unless you have been properly trained to do so. Doing so may result in serious injury or death.
- Ensure proper isolation of any energy sources and residual pressures by complying with all local, state and country-specific regulations/ directives applying to energy control procedures (lockout/tagout).
- Ensure that the pressure relief valve and system is at an ambient temperature before inspecting, servicing, or repairing. The valve, system, and contents may be extremely hot or cold. Failure do so may result in serious injury.
- The discharge from the main valve outlet or any other vents, should be piped or vented to a safe location to eliminate the potential for serious injury or damage during relief operation.
- Prior to valve disassembly, ensure that proper controls are implemented to address potential exposures to hazardous substances, including gases, liquids, or process byproducts contained in or contaminating the valve. Consult applicable material safety data sheets (MSDSs) and established exposure limits for the substances expected to be present to ensure proper exposure controls are implemented. Failure to do so could result in serious injury or illness.
- To ensure the valve is free to operate, check the inlet and outlet piping for potential obstructions which may exist as a result of process fluid solidification, polymerization or other system problems. Failure to do so could render the valve inoperable, leading to serious injuries or damage in the event of system over-pressurization.
- Use extreme caution when inspecting a pressure relief valve for leakage. Always stay clear of the valve outlet during seat leakage testing as the valve can suddenly open fully causing serious injury. Doing so could result in serious burn, chemical or injection injury.
- Use all appropriate personal protective equipment to protect against process hazards, including but not limited to, pressurization, temperature extremes, noise, and chemical hazards. Failure to do so could result in serious injury or death.

CAUTION

- Always use the appropriate tools, and in the correct manner, for adjustment or servicing of valves. Failure to do so could result in injury.

SAFETY INSTRUCTIONS

- It is the responsibility of the customer and user of Farris valves to properly train their personnel on all required maintenance procedures and safety standards to prevent injuries.
- Farris can provide comprehensive training on the maintenance and repair of all Farris products. Contact your local Farris representative or the factory.

NOTICE

- Improper handling, storage, installation and maintenance of a PRV can cause damage to the valve and will invalidate the warranty. Please follow all recommended procedures.

Introduction

WARNING

These installation and maintenance instructions are being provided to ensure the proper installation, repair and safe operation of Farris pressure relief valves. Pressure relief valves are precision instruments and should only be installed and repaired by personnel who have been properly trained and qualified to provide this service. Correct installation is essential for plant, property, personnel and public safety. Failure of a pressure relief valve can lead to catastrophic overpressure of equipment and/or the release of effluent under pressure. Effluent may be hazardous and all precautions should be taken to ensure safe disposal.

Receiving Inspection, Storage & Handling

NOTICE

Failure to inspect, store and handle the PRV can cause improper functioning of the valve. Please read and follow these instructions.

WARNING

Cleanliness is essential to the satisfactory operation and tightness of a pressure relief valve. Prior to installation the following practices should be followed:

- Upon receipt, look for any shipping damage. Inspect packaging for evidence that the valve has been tipped over or dropped.
- Verify the nameplate data against ordering documents.
- Confirm that factory wire seals are in place and not broken.
- If it appears that the wire seal has been broken, the name plate information does not match documentation, or if the packaging or valve appear to have been damaged in transit, please contact your local Farris representative.
- Inlet & outlet covers should be left in place until the valve is installed.
- Valves should be moved and installed with the stem upright, in the vertical position.

  Note: Pilot operated relief valves should never be lifted or handled using the tubing, piping, pilot, or pilot brackets. Use the lifting eyes provided on the main valve body to move the valve.
- Care should be taken to keep the inlet and outlet clean and free of foreign material.
- Valves that are not immediately installed in service should be stored indoors, in the original container and in an area free of dirt and other contamination. The storage area should be at normal temperatures (50 to 100 °F/10 to 38 °C).

Pre-Installation Testing

NOTICE

Failure to follow proper test procedures or to use proper test equipment will lead to incorrect test results, damage to the valve and will void the warranty.

Before installation, it is important to confirm the set pressure and seat tightness. This testing should only be performed by trained and qualified personnel using proper test equipment.

When performing pre-installation testing please note the following:

- Testing must only be performed using the correct test fluids. Air, gas and vapor service valves must be tested using air as the test fluid. Liquid service valves should be tested on water and steam service valves must be tested on steam.

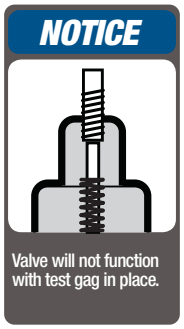
  Note: For pilot operated relief valves on liquid service, introducing liquid into the dome area of the main valve and pilot assembly during pre-installation testing may later cause problems when the valve is placed into service. An air test may be substituted to confirm valve functions, but set pressures may vary from actual setting due to the difference in test media.
- Set pressure testing must be performed first, followed by seat leakage testing. Seat leakage testing is performed at 90% of set pressure. For valves set at 50 psig (3.45 barg) or below, the test pressure is 5 psig (0.35 barg) below the set pressure.
- If qualified personnel and proper test equipment are not available the pre-installation testing should be skipped.

Installation

WARNING

Pressure relief valve performance can be adversely affected by improper installation. To ensure good performance and safe operation of the valve these guidelines should be followed. Failure to do so could result in valve failure, serious injury or death.

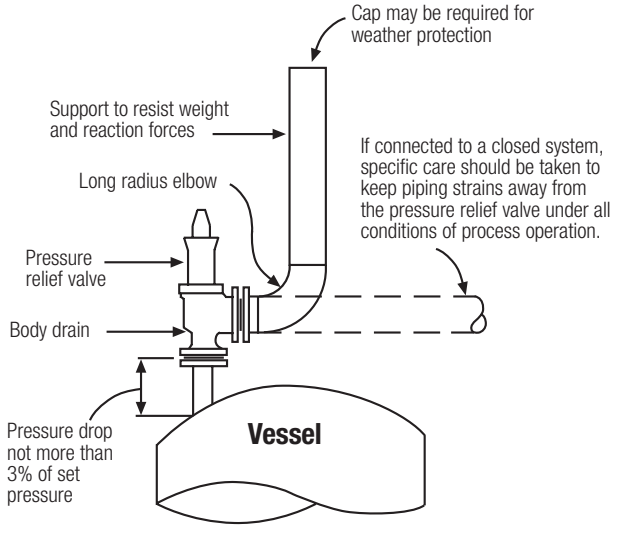
- Pressure relief valves may contain sharp surfaces. Proper personal protective equipment (PPE) should be used.
- Before installing a valve, depressurize the system.
- Always install valves upright with the stem in the vertical position and the inlet at the bottom. Remove the optional test gag, if supplied.
- Install valves close to the pressure source so that inlet pressure loss is no more than 3% of set pressure.
- To avoid reducing the valve's actual capacity, be sure piping connected to the valve's inlet/outlet connections is equal to or larger than the valve connections.
- Avoid installing valves close to equipment that can cause pressure fluctuations, such as compressor discharge lines.



- Install valves away from equipment that may cause turbulence, such as reducing stations, orifice plates/nozzles, and other valves and fittings.
- Make sure all inlet and outlet piping is properly supported to avoid putting excessive load on the valve. Provide drainage from the discharge piping or valve body.
- On valves with bellows, remove plastic shipping plugs from the bonnet and vent in a safe direction. Do not pipe bonnet vents to a pressurized system that would introduce backpressure.
- Clean inlet and outlet flange surfaces and valve interior cavity to remove rust inhibitors.
- Remove the inlet and outlet flange protectors and any extraneous packing or documentation materials inside the valve body or nozzle.
- Test levers are provided on some valves to allow the user to manually verify that the valve trim is free to move. Test levers should only be pulled when system pressure is greater than 75% of set pressure in order to avoid potential damage to the valve. In addition the valve should never be carried by the test lever as this can move the disc off the seat resulting in damage to both parts.
- Tighten all inlet and outlet flange bolts evenly. Leave enough room to allow for in-line maintenance and adjustments.

Additional Instructions for Pilot Valve:

- Pilot valves are equipped with bug vent(s) on the pilot control bonnet and/or body. Check to be sure vents have not been plugged.
- The pilot control discharge is vented to atmosphere since the volume released when the valve opens is small. If a release to atmosphere is not permitted, then vent the discharge to a safe location. Do not pipe discharge to a pressurized system that would introduce backpressure unless it is a balanced pilot control design.
- On pilot valves supplied with field test connections, remove the plastic shipping plug from the isolation valve and assure that it is partially open.



System Start Up and Testing:

It is recommended that the valve be isolated during pressure testing of the system either by blanking, closing a stop valve or using a test tag. If a test gag is used, exercise extreme caution to avoid damaging the valve stem or seat by over tightening the gag screw. Gag screws should be installed hand tight and should always be removed after system testing has been completed. Remove the optional test gag, if supplied.

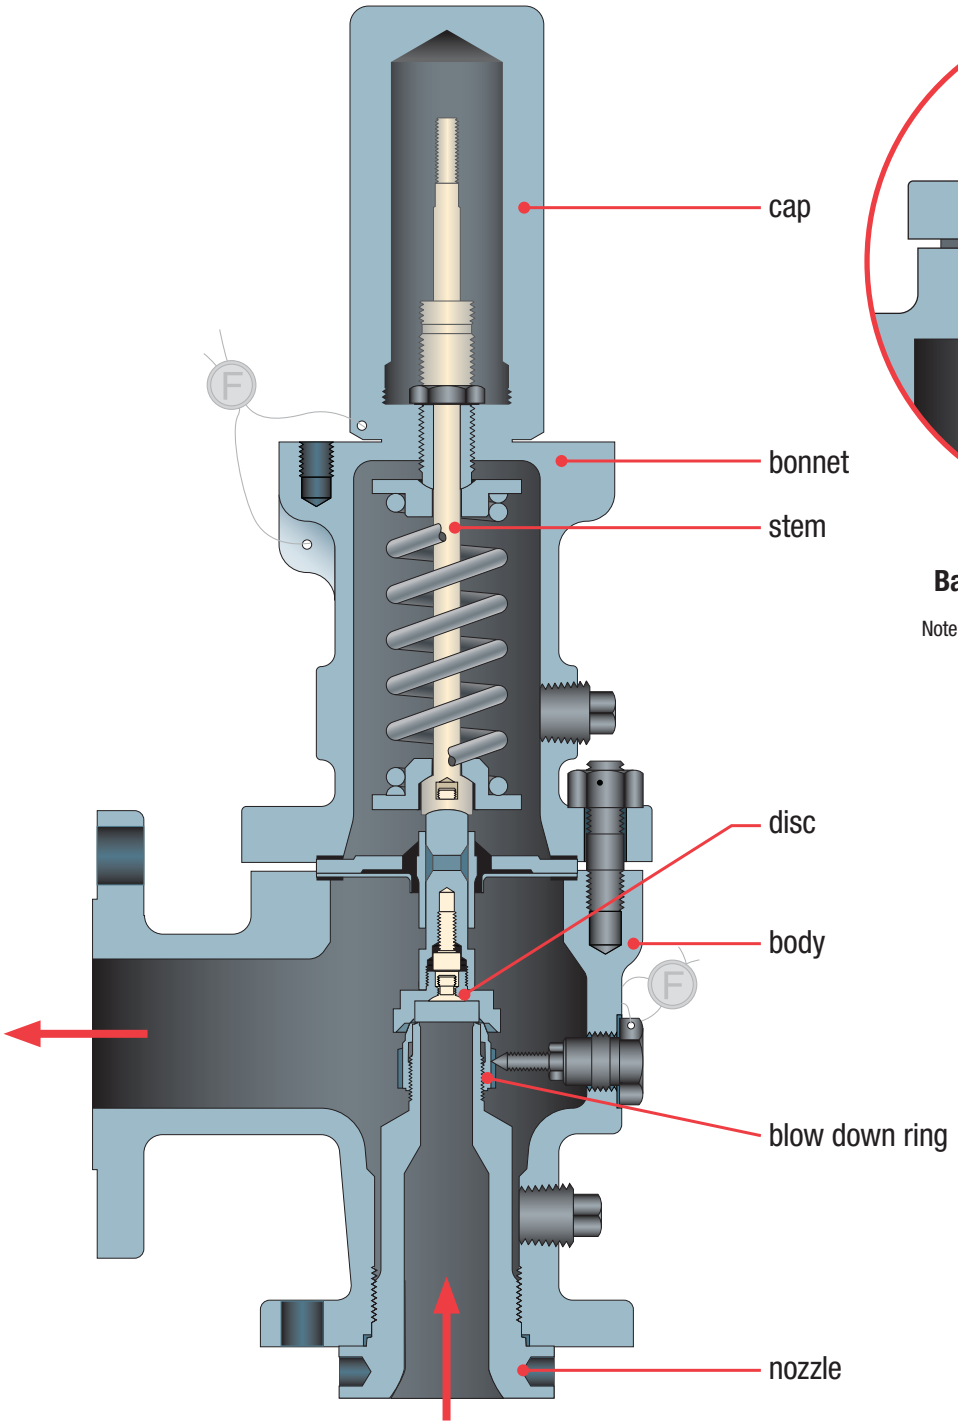
Maintenance Basics

WARNING Pressure relief valve maintenance should only be performed by trained and qualified personnel using proper test equipment. Repairs by unqualified personnel or use of improper test equipment may lead to poor valve performance.

These basic instructions apply to all Farris valve series. They do not provide information specific to product lines. For more detailed maintenance instructions, please consult the appropriate manuals for the valve under consideration. As a general rule, these procedures apply to all pressure relief valves:



- Proper personal protective equipment (PPE) should be used.
- Before repairing or servicing a valve depressurize the system.
- For valves, that have been in service, a review of the material safety data sheet (MSDS) of process effluent should be done prior to disassembly. Proper controls should be in place to address potential exposures to hazardous substances, including gases, liquids, process media, or process by-products contained in the valve.
- External surfaces of the valve, including flange face surfaces and threaded connections, should be examined for any signs of damage or rough handling.
- Completely disassemble the valve and thoroughly clean all parts.
- Parts should be examined for signs of corrosion or excessive wear. Particular attention should be given to ensuring all threads are clean and free of burrs.
- Examine stem to ensure it is straight.
- Lap the nozzle seat and disc seating surfaces to a flat mirror finish.
- Reassemble valve making sure to lubricate all threaded and bearing surfaces.
- Standard repair procedure requires that all gaskets and soft goods such as O-ring seals be replaced with new parts.

- Valve should be calibrated to the set pressure indicated on the nameplate unless a new pressure is required. When the set pressure is being changed maintenance personnel must confirm if the existing spring is acceptable or if a new spring is required.
- Testing must only be performed using the correct test fluids. Air, gas and vapor service valves must be tested using air as the test fluid, liquid service valves should be tested on water, and steam service valves must be tested on steam.

  Note: For pilot operated relief valves on liquid service, introducing liquid into the dome area of the main valve and pilot assembly during maintenance testing may cause problems when placed in service. The setting and testing of the pilot control may be done separately from the main valve on the proper fluid. An air test may be substituted to confirm valve functions, but set pressures may vary from actual setting due to the difference in test media.
- Set pressure testing must be performed first, followed by seat leakage testing. Seat leakage testing is performed at 90% of set pressure. For valves set at 50 psig (3.45 barg) or below, the test pressure is 5 psig (0.35 barg) below the set pressure.
- After the repair has been completed, all external adjustments should be wire-sealed to prevent tampering. Inlet and outlet openings should be sealed until the valve is ready for installation in order to prevent foreign material from entering the valve.

Farris Aftermarket Services

FAST Track Turnaround

Farris Engineering is dedicated to making our FAST Program work for you, which is why we have the FAST Track Center at our headquarters in Brecksville, OH. For urgent service requirements, our FAST Track Center has a large inventory of spare parts, finished valves, and dedicated machining and material resources. Farris can provide quick turnaround on inventory and machined parts for both current and obsolete valve designs.

FAST Centers

Our FAST Centers are a global network of independently owned and operated valve repair facilities offering:

- Total valve replacement, service and repair any hour, any day: 24/7 – 365
- Local pressure relief valve inventories, plus a Web-accessible global inventory
- Factory trained, ASME and VR approved facilities
- Asset management solutions to keep plants safe

Look for the FAST tag, your assurance for quality and safety.

FAST tags

In the US or Canada contact 1-877-FARRIS1 or 1-877-327-7471 to find the location of your nearest FAST Center, or for a global listing go to ***http://farris.cwfc.com/Services/spokes/fast_centers.asp***

GROVE B4, B5, & B7 Side-entry Ball Valves

FEATURES AND BENEFITS

Cameron's Valves & Measurement business segment is a leading provider of valves, valve automation, and measurement systems to the oil and gas industry.

We provide large-diameter valves for use in natural gas, LNG, crude oil, and refined products transmission lines as well as in many other general industrial applications.

Rigorously tested, field-proven, and backed by our services team, Cameron's GROVE® valves are among the best known valves in the world.

Applications

GROVE split-body side-entry ball valves are manufactured in a wide range of diameters and pressure classes.

In the standard versions, the valves are specified for transmission pipelines, pumping, compression and reinjection units, offshore platforms, onshore terminals, pig traps, measuring stations, and surge-relief skids.

These valves also can be built for speciality applications, such as subsea installations and LNG plants.

Split-body construction allows the use of forged materials in various grades of carbon steel, stainless steel, and high alloys, equipping the valves for some of the most severe service conditions.

B4 ● B5 ■ B7.1 ▲ B7.B ◆

GROVE B4

DESIGN FEATURES

Standard Features

The standard design valve code is B4.D.

- Double-barrier stem seals (the upper seal can be replaced with the valves in-line, under pressure, with the ball in the closed position)
- Short coupled trunnions reduce unit bearing loads and operating torque
- Factory-positioned external stops
- Stem separated from the ball; anti-blowout design; side load on stem
- Plastic polymer insert for seat sealing
- Self-relieving seats for ASME Classes 150 and 300
- Metal-backed, self-lubricating PTFE sleeve bearing and thrust washers reduce torque and extend service life
- Nickel plating for trim parts
- Fire-safe graphite rings for protection against external leakage

Options

According to the design impact of the optional features, the valve code may change to B4.B, B4.C, etc.

B4 – ALL TYPES

- PTFE various grades of reinforced gaskets, spring energized, for stem and seat sealing
- Antistatic device
- Metal-to-metal seats
- Double-sealing barrier in both directions (DPE) for ASME Classes 600, 900, and 1500; body relief valve for overpressure due to liquid thermal expansion
- Double block-and-bleed capabilities
- Explosive decompression-resistant seals

B4.B TYPE

When the valve design includes one or more of the following variations with respect to the standard design, the denomination becomes B4.B.

- Triple-barrier stem seals; upper stem seal O-ring replaceable with pressure in-line with the ball in the closed position
- Self-relieving seats

B4.C TYPE

This version of the B4 valves (in ASME Classes 600, 900, and 1500) features:

- O-ring seat seal
- Double-sealing barrier in both directions (DPE) and body pressure relief valve

Body Construction

The body is made of three forged parts, and the bolted construction allows disassembly in the field for repairs. The body drain is located in the lowest part of the body cavity and consists of a 1/4" NPT drain valve with safety plug. Graphite rings are provided for compliance with API 6FA and BS 6755 Part 2 fire-safe standards.

Stem Construction

The stem function is to transmit torque and to absorb the line pressure thrust together with the trunnion. The stem of Cameron's GROVE B4 valves has an anti-blowout design and incorporates a double-barrier system. The pressure thrust on the stem is supported by a thrust washer in antifriction material.

Seat Seal

The soft sealing between the seat and the ball is achieved by a plastic insert on B4.B, B4.D valves and by an O-ring on B4.C valves.

The block-and-bleed and double block-and-bleed capabilities are available as per API 6D definition on all types of B4 valves.

Self-relieving seats are standard on all B4.B, B4.C, and B4.D ASME Classes 150 and 300.

Independent sealing on upstream and downstream seats is available on B4.C and B4.D ASME Classes 600, 900, and 1500.

Ball Position

For valves normally mounted with lever, the ball open and closed positions are ensured by corresponding stops on the bearing housing. The lever position parallel to the line flow means the valve is open. For valves with gears or actuators, the stops are set at the factory as primary stops. An “open/closed” indicator also is provided.

MATERIALS SPECIFICATIONS

Materials Selection

The design of the valve also depends on the materials of construction selected.

After examination of service conditions, the selection criteria are based on the verification of the physical and chemical characteristics of the materials or product.

For the soft sealing (O-rings, inserts, and lip seal gaskets), the guidelines to be followed are relevant for hardness, tensile strength, modulus, compression set, swelling, and fluid suitability.

The process is qualified so that the final thickness after machining can verify the chemical composition as per the relevant ASTM standard. The final check is carried out by the liquid penetrant method.

Weld Overlays

Sealing areas and other critical parts of the valve can be weld overlayed in case of corrosive service.

More frequently used materials are AISI 316L and Alloy 625.

Duplex Stainless Steels Metallurgy

On duplex (22 Cr to 2 Ni) and superduplex (25 Cr to 5 Ni) stainless steels, corrosion-resistance qualification check can be as follows:

- Chloride corrosion as per ASTM G48 (104° F or 40° C, 72 hours)
- Cracking as per ASTM G36 (302° F or 150° C, 500 hours)
- Pitting corrosion PRE = 33 min. for duplex, 40 min. for superduplex
- Ferrite content 40% to 60%, as per ASTM E562

NACE Requirements

On request, GROVE side-entry ball valves can be supplied in accordance with NACE MR0175.

Severe Wet Sour Gas Service

In addition to NACE MR0175, the additional qualifications can be:

- Sulfur ≤ 0.015%
- Hydrogen-induced cracking as per NACE TM-02-84 (96 hours)
- Sulfide stress corrosion cracking as per NACE TM-01-77 (720 hours)

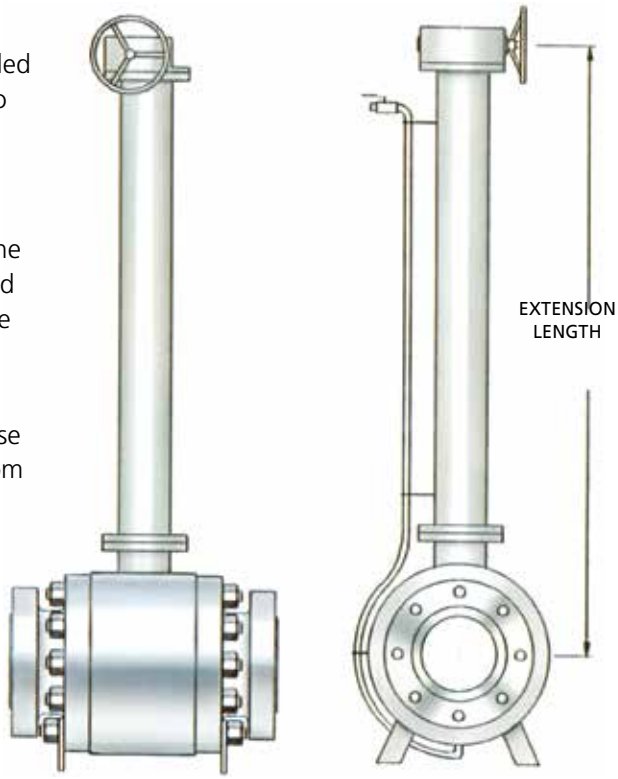
OPTIONAL FEATURES

Metal-to-Metal Seats

The contact area between the seats and the ball can be completely metallic. This feature is required when tight sealing is needed and the standard soft seal is no longer suitable due to the unfavorable combination of pressure, temperature, and chemical composition of the medium and/or when solid particles are present and when operating conditions prevail.

In case of metal-to-metal seats, the ball and seats coating can be obtained by means of various materials and processes, such as:

- Electroless nickel plating
- High-velocity application of carbide powder



When utilizing the metallic seats, it is necessary to verify the structure of the stem/ball coupling and the actuator choice, as there is an increase in the valve torque.

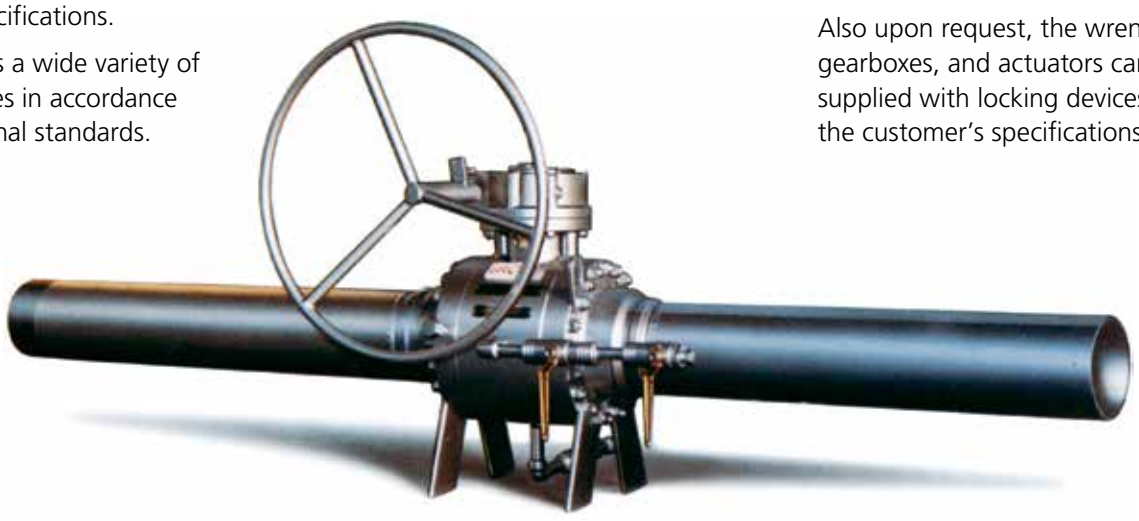
Stem Extensions

GROVE ball valves can be provided with optional stem extensions to permit buried or underground installations in remote or inaccessible areas.

When used for buried service, the stem extensions can be furnished watertight, and the piping of the grease injection system also will be extended.

When ordering extensions, please specify the distance required from the valve centerline to the handwheel centerline.

Transition Pieces



Cameron can weld transition pieces to the valve during the manufacturing process. Transition can be supplied by the customer or by Cameron to suit the customer's specifications.

Cameron offers a wide variety of weld procedures in accordance with international standards.

Other

Upon request, the valve can be furnished with specific adjustments for the installation with the horizontal stem.

Also upon request, the wrenches, gearboxes, and actuators can be supplied with locking devices to suit the customer's specifications.

SPECIAL APPLICATIONS

"S" Design for Subsea Service

The "S" valves are the subsea versions of the B4, B5, and B7 ball valves, specifically designed to suit subsea service conditions.

The "S" design takes into consideration the restrictive criteria used in the definition of safety coefficients relative to both pressure-retaining components and the stem connection between the valve and actuator, making the "S" valve suitable for EDS service.

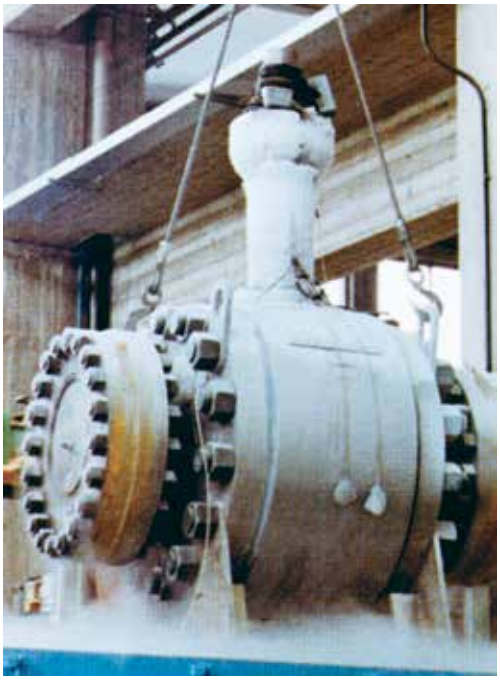
The critical internal sealing surfaces are protected from corrosion resistance by the overlay, generally dictated by customer specifications and checked by chemical analysis of test specimens and the part(s).

The body is coated with special products and the body/bonnet bolts are protected with special protective coatings and special sealing caps. The stem and external sealing areas are protected with additional seawater sealing gaskets.

The "S" valve is designed to be reliable and to provide optimum service with reduced maintenance. It usually is installed on modular rigs placed on the seafloor, complete with necessary components. When necessary, substitution or complete removal of these modules is possible.

"L" Design For Low-temperature Service

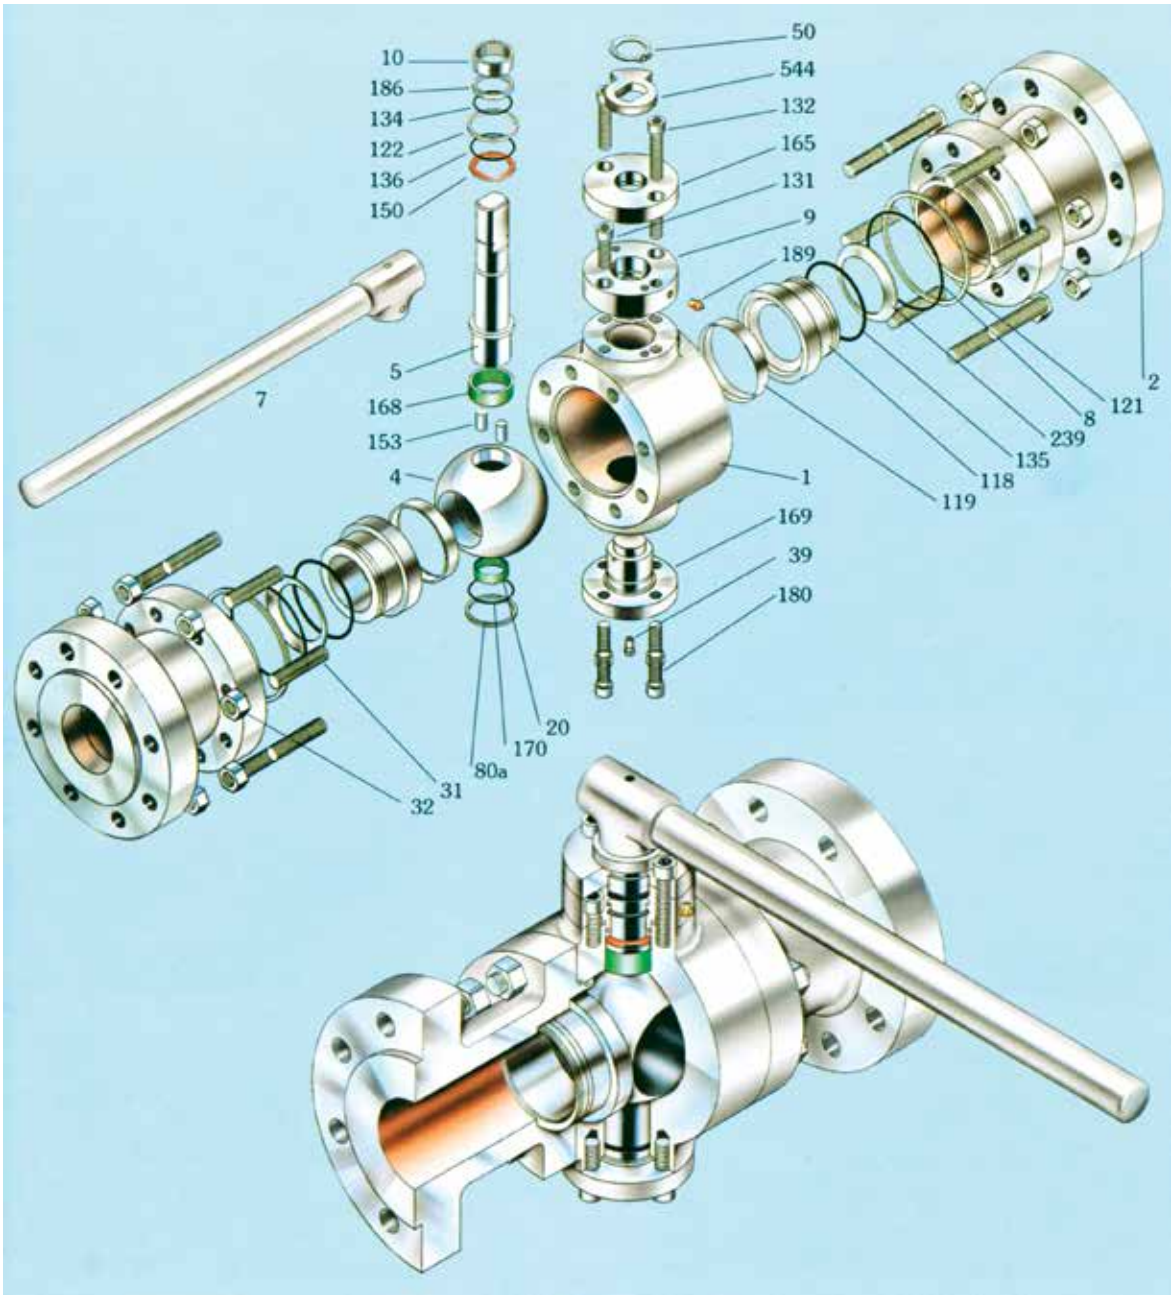
For certain gas treatment processes (e.g., LNG) and blowdown conditions, the valve must be able to limit the leakage within specified value and to ensure the maneuverability at a low temperature. The B4-L, B5-L, and B7-L valves are suitable for temperatures down to -184° F (-120° C).



The valves are referred to the respective standard types, but materials, parts dimensions, surface finishing, gaskets, and stem connections are specifically designed to suit low temperatures.

Epoxy-Phenolic Internal Coating

Cameron has developed a technology for anti-corrosive internal coatings. The products have been designed for oil brine, seawater and drinking water service, sour and corrosive applications.



The final thickness can be 180 to 350 microns. Hydrostatic shell testing is conducted before and after coating and thickness and holiday testing records are maintained.

GROVE B5

DESIGN FEATURES

Standard Features

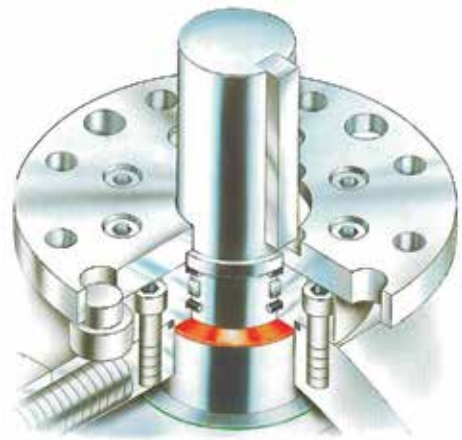
- Double-barrier stem seals
- Stem separated from the ball; anti-blowout design; no side load on the stem
- Bearing blocks absorb the pressure load on the ball
- Primary metal-to-metal seal and secondary protected synthetic O-ring seal
- Double-sealing barrier in both directions (DPE)
- Body relief valve for overpressure due to liquid thermal expansion
- Built-in sealant injection system for emergency seat seal
- Metal-backed, self-lubricating PTFE sleeve bearing and thrust washers reduce torque and extend service life
- Nickel plating for trim parts
- Trunnion mounted ball for ease of operation at high pressure
- Large-diameter, short coupled trunnions to reduce unit bearing loads and operating torque
- Bolted construction permits disassembly in the field for repairs
- Integral stop in the adapter plate for a permanent reference to open and closed position
- Antistatic device

Options

- Triple-barrier stem seals
- Emergency grease fitting for stem
- Self-relieving seats
- Plastic polymer O-ring or insert for primary seat sealing
- Double block-and-bleed capabilities
- PTFE various grades of reinforced gaskets, spring energized, for stem and seat sealing
- Metal-to-metal seat
- Explosive decompression-resistant seal

DESIGN FEATURES (CONT.)

Body Construction



The body is made of three forged parts, and the bolted construction allows disassembly in the field for repairs. The bolts threads areas are per ISO metric or ASME imperial, depending on the market request. The tightening of the bolts is made by hydraulic tools with a predetermined torque. The body drain is located in the lowest part of the body cavity and consists of an NPT drain valve with safety plug.

Stem Construction

The stem of Cameron's GROVE B5 valve is separated from the ball and is connected to the upper ball trunnion by steel pins. Bearing blocks are located on the upper and lower ball trunnions, which absorb all the pressure load on the ball.

The stem is a free member and carries no side thrust.The absence of this side load and friction drag on the stem ensures lower operating torque and long service life.

The stem is sealed by means of two O-rings. If leakage should ever occur through both stem seals, the outer O-ring can be replaced with the valve in the line, under pressure with the ball in the closed position. With no pressure in-line, it is possible to remove the gland plate for replacement of both primary and outer stem O-rings. The stem also can be removed and replaced if necessary.

Torque

Cameron's GROVE B5 valve's low operating torque is due to a combination of factors:

- The design of the stem, which is separated from the ball
- The side loads, brought on by differential pressure, are absorbed by two (upper and lower) rigid bearing retainers and large-diameter, short coupled trunnions to reduce unit bearing loads
- The metal-backed, self-lubricating sleeve bearing and the thrust washers reduce the torque and extend service life

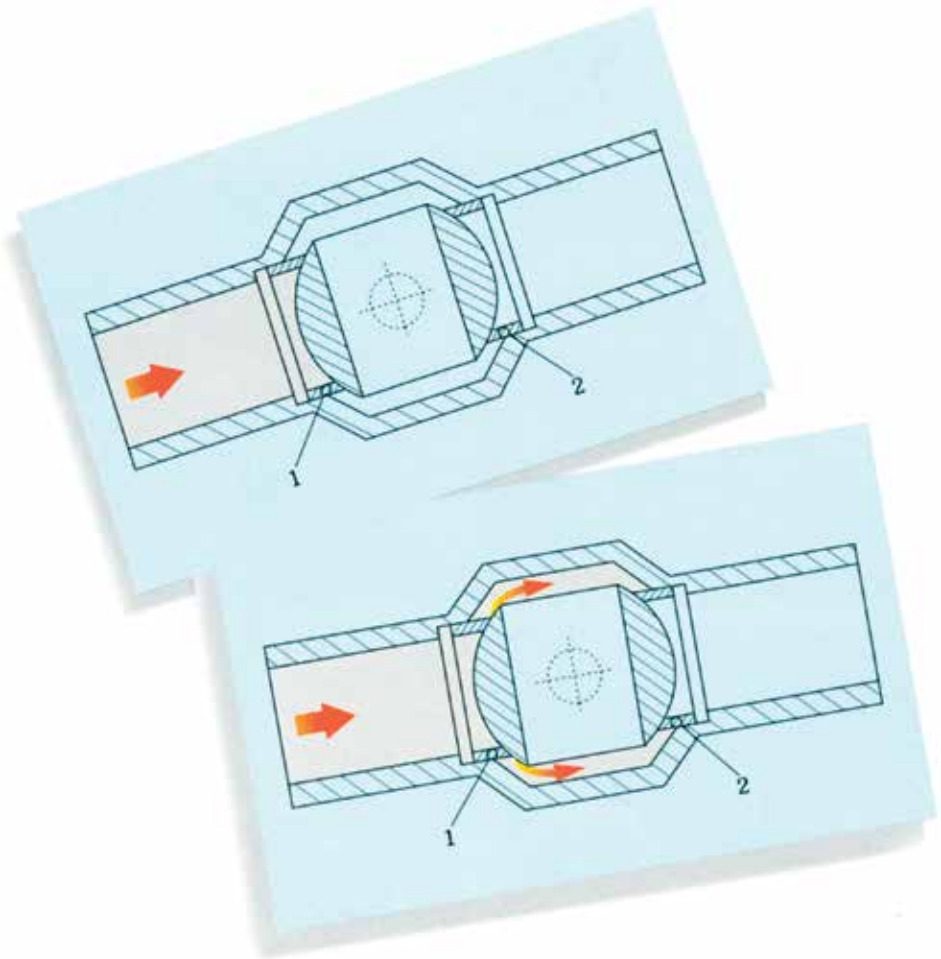
Ball Position

The ball's open and closed positions are ensured by corresponding stops on the adapter plate.

The valve normally is mounted with the actuator stops or the gear stops set at the factory as primary stops.
An “open/closed” indicator also is provided.

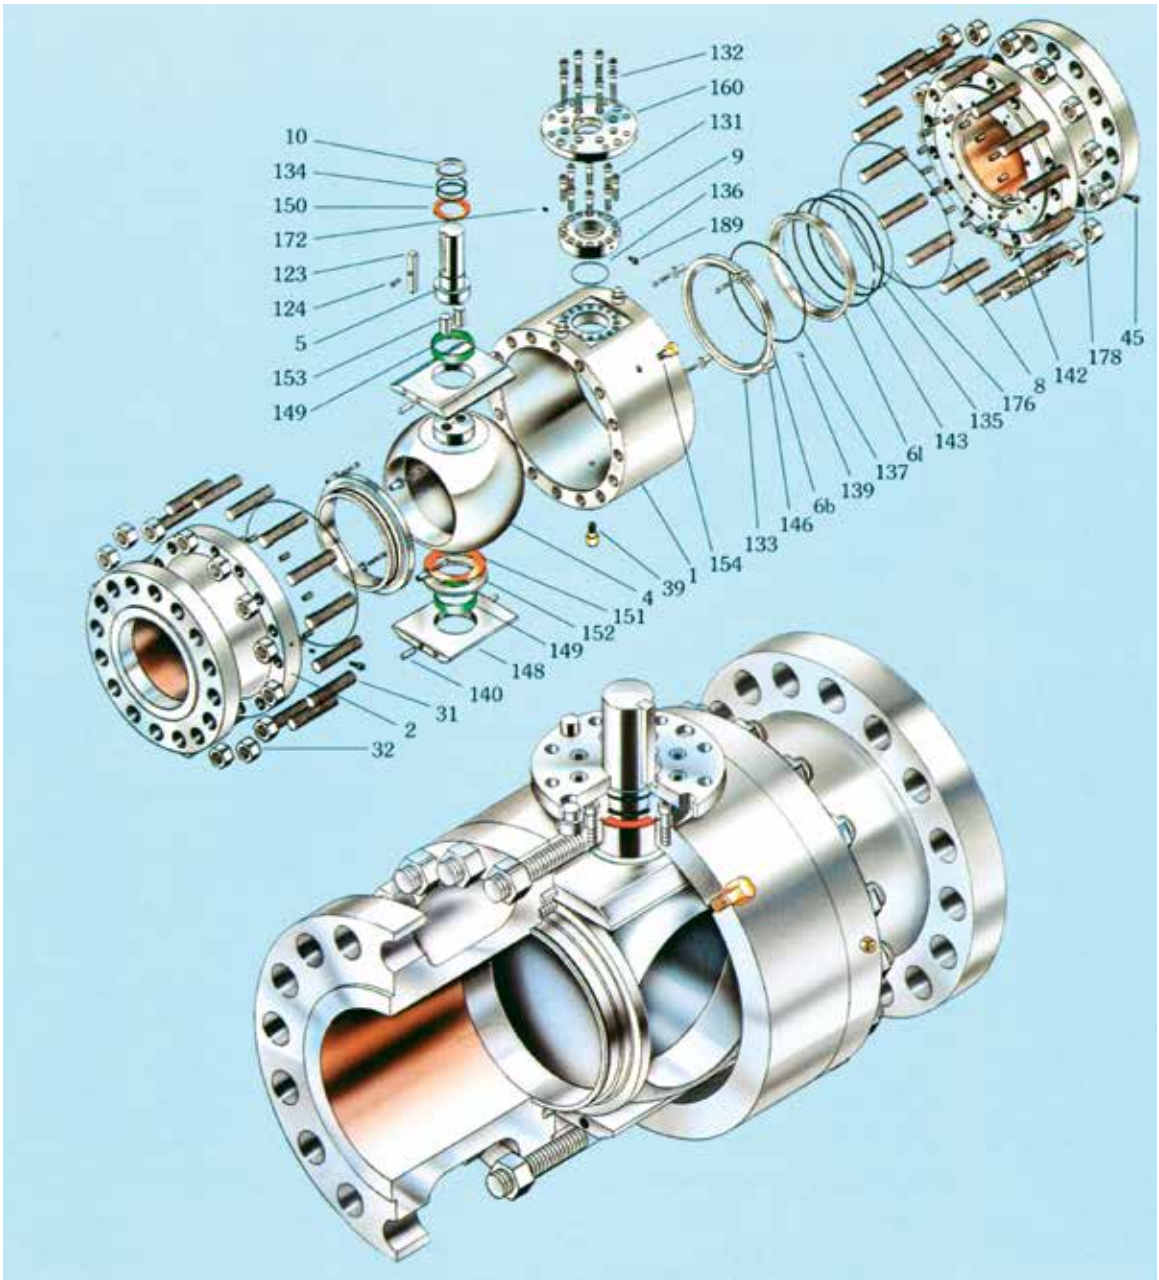
Seat Seals

The GROVE B5 seat design ensures double-barrier sealing in both directions (the normal self-relieving seats are a simple barrier of sealing). The sealing is performed by both a primary metal-to-metal seal and a secondary protected O-ring seal.



Double Piston Effect (DPE)

The DPE seat design was invented and patented by Cameron's GROVE team. The DPE seat design allows for both seats to seal with pressure acting from the same side of the valve. In the event one seat becomes damaged, the user has the added advantage of the opposite seat sealing. By means of this double barrier, the sealing is ensured regardless of the direction of the flow through the valve.



If the upstream seat (1) becomes damaged and leaks, the pressure entering the body cavity acts on the downstream seat (2), sealing the downstream seat tightly against the ball.

Note: The DPE feature and the double block-and-bleed feature are not to be confused with one another.

The initial seal, at extremely low pressure differential or vacuum conditions, is obtained with spring-loaded floating seats, which are free to move slightly along the longitudinal axis of the valve. Line pressure behind the seat ring supplements the seat spring load to force the seat tightly against the ball.

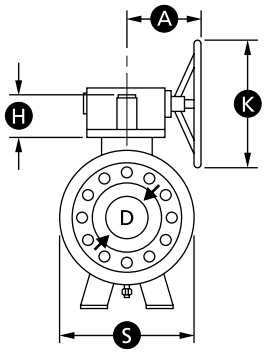
(1) Upon request



Flanges in accordance with ASME B16.5

Shaded bore sizes (D) according to API 6D
Shaded end-to-end dimensions (E) according to API 6D
Butt welding ends according to ASME B16.25

Larger sizes available on request
Reduced-bore valves also available

GROVE B7
DESIGN FEATURES

Standard Features

B7.1

- Triple-barrier stem seals
- Factory-positioned external stops
- Emergency grease fitting for stem
- Stem separated from the ball; anti-blowout design
- Plastic polymer insert for seat sealing
- Self-relieving seats
- Metal-backed, self-lubricating bearings/washers
- Nickel plating for trim parts
- Fire-safe graphite rings
- Antistatic device

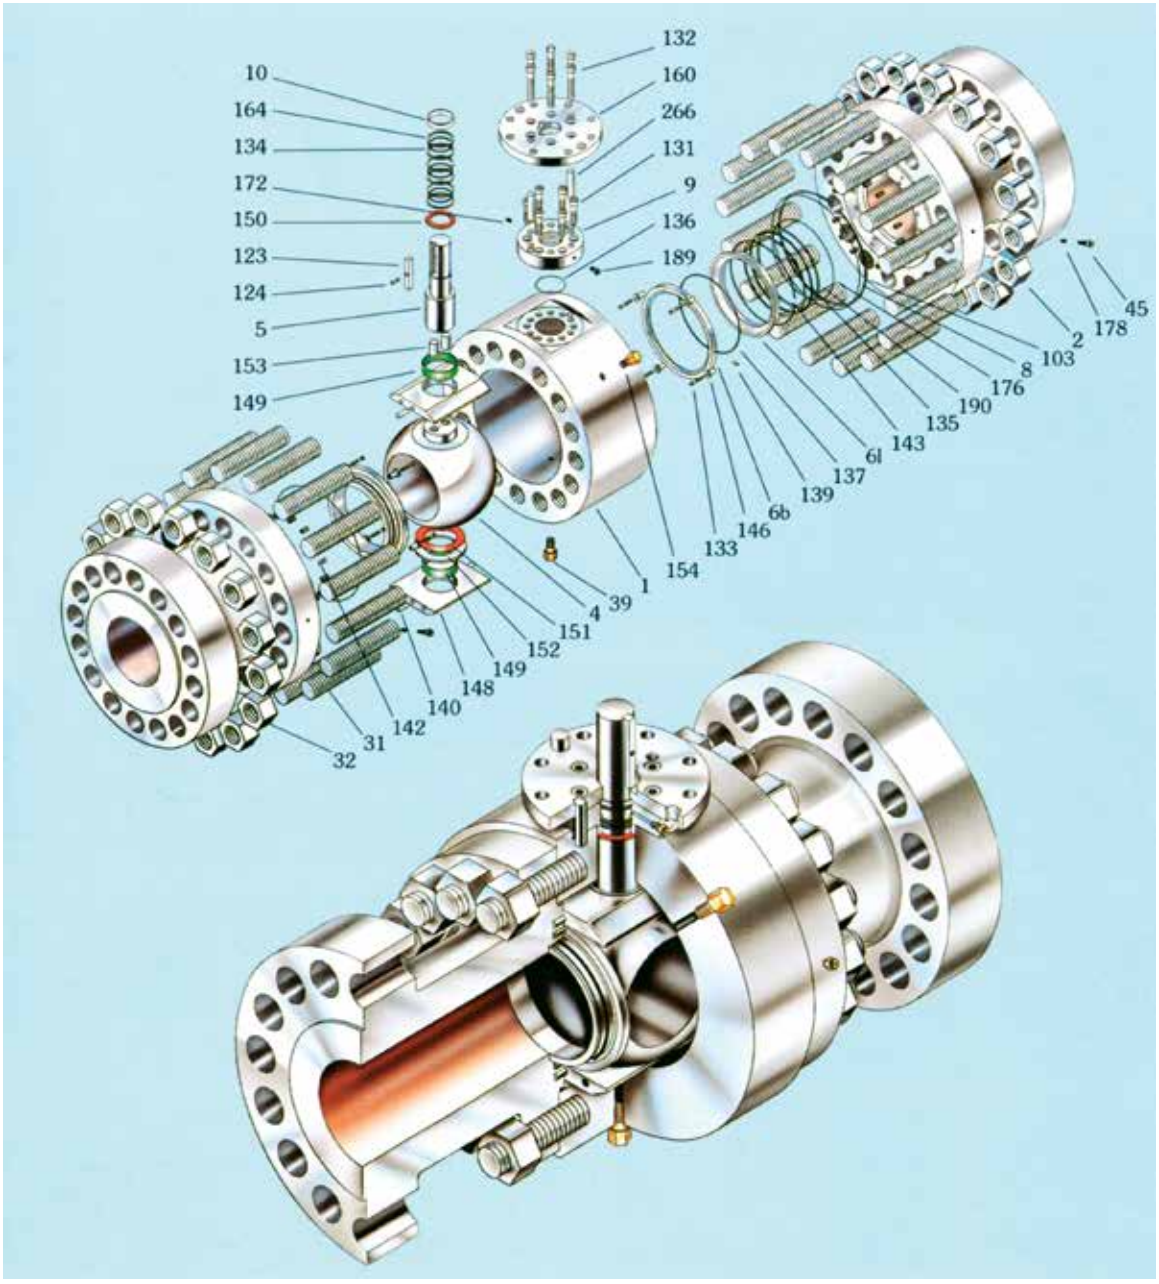
B7.B

- Triple-barrier stem seals
- Stem separate from the ball; anti-blowout design
- Ball load on the bearing blocks
- Double-barrier sealing in both directions (DPE)
- Body relief valve for overpressure
- Sealant injection system for emergency seal
- Metal-backed, self-lubricating bearings/washers
- Nickel plating for trim parts
- Trunnion mounted ball

Options

B7.1

- PTFE various grades of reinforced gaskets, spring energized, for stem and seat sealing
- Metal-to-metal seats
- Double-barrier sealing in both directions (DPE)
- Body relief valve for overpressure
- Double block-and-bleed capabilities



Valve Construction

The B7 denomination identifies the side-entry ball valve ASME Class 2500.

Due to the high pressure and strong force involved, the materials selection is carried out by paying particular attention to the anti-extrusion features of the gaskets and to the resistance of the ball and stem materials.

Quality System

Quality Assurance Program

ISO 9001:2000 and API Q1 Standards

All valves are designed in accordance with the most stringent industry procedures and standards and are built according to the European Directives PED and ATEX upon request.

Approvals

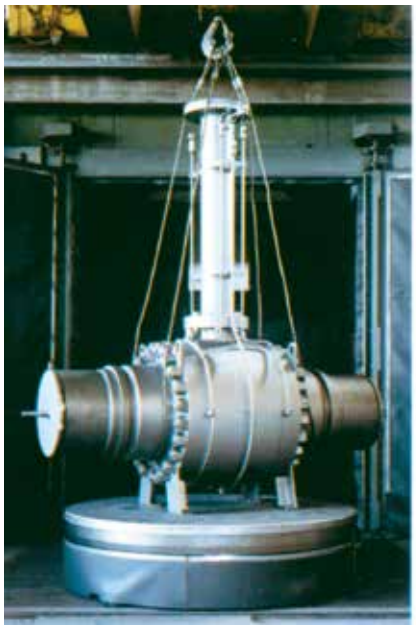
Cameron is an authorized licensee to use the American Petroleum Institute (API) monogram for specification API 6D and API 6A.

Certifications

- ISO 10423/API 6A
- ISO 14313/API 6D
- ISO 17423/API 6DSS

Inspection

Inspection is done per the Quality System requirements based on ISO 9001:2000 and API Q1. Cameron verifies all processes from material receipt to final customer inspection, including the liaison with third-party inspection and certifying authorities.



All products can be supplied with certified test reports, which include pressure testing, NDT, and chemical and physical analysis, along with any other specified special test requirements.

The material certification of the valve parts can be furnished in accordance with DIN 50049-EN 10204 3.1 (at least) or 3.2.

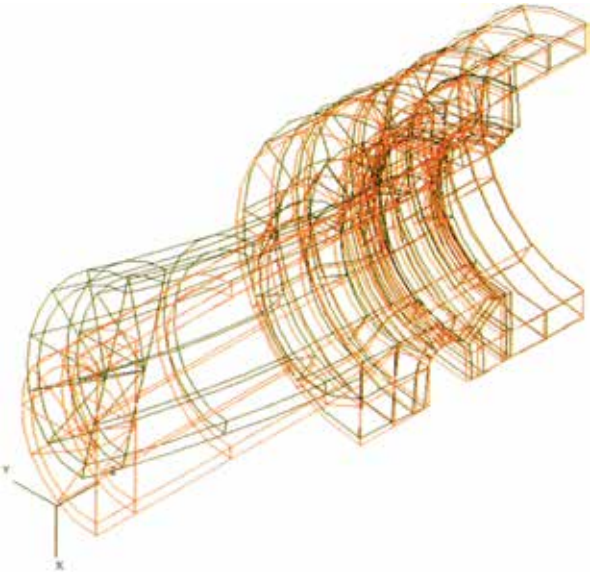
Special Process

Cameron operates its own in-house electroless nickel plating (ENP) facility.

ASTM B656 and ASTM B733 are the reference standards for plating process and control. Strict quality control procedures for critical process conditions and for the plated components maintain plating consistency.

Qualification Testing

Research and Development Lab



Cameron's GROVE valves are designed in accordance with the applicable or requested codes and are subjected to full in-house qualification testing. Our in-house testing facilities, with the participation of the major oil and gas companies' R&D programs, allow Cameron to supply high-quality products.

Hydraulic and gas sealing tests, functional tests, and cycling and torque tests all are carried out on prototype valves. These test procedures ensure that the design safety factors, the maximum allowable leakage rates, and the expected valve service life are achieved.

Structural Verification

Cameron's engineering department operates an advanced 3D CAD system and conducts finite element analysis (FEA) to simulate various load conditions to determine a component's suitability for the intended service.

Fire-Safe Tests and Certifications

Cameron conducts in-house fire-safe testing, and its GROVE valves are certified in compliance with API 6FA and BS 6755 Part 2 fire-safe standards.

A complete reference list of qualified and certified valves can be made available upon customer's request.

Cycle Testing Under Flow Conditions

Through its in-house flow facility, Cameron verifies the behavior of valves subjected to cycle testing under dynamic flow conditions with the presence of abrasive particles. This test loop has the capacity to test valves up to 6" nominal bore with a maximum service pressure of 2900 psi (200 bar).

The main test parameters are PC entered and recorded for future design reference.

High-Pressure Gas Testing

Customers' specifications may dictate more severe testing in addition to conventional hydrostatic testing.

Cameron is fully equipped to carry out enhanced gas testing at ambient, low and high temperatures using specially equipped bunkers. External leakage rates (if any) are verified by means of a mass spectrometer. Leakage through the seats (if any) is verified by means of calibrated flow meters.

For low- and high-temperature service, gas testing can be performed to customer-specified critical dimensions. Cameron has test facilities for various valve dimensions. Testing can be performed at a range of temperatures from -184° F to 752° F (-120° C to 400° C).

Services for Valves and Actuation

WE BUILD IT. WE BACK IT.

Global Network and Local Support

Cameron is well-positioned to deliver total aftermarket support, quickly and efficiently, with unmatched OEM expertise. Our highly skilled engineers and technicians are available around the clock, seven days a week to respond to customer queries, troubleshoot problems and offer reliable solutions.

Easily Accessible Parts and Spare Valves

- OEM spare valves, actuators and parts (including non-Cameron brands)
- Handling, storage, packaging and delivery
- Dedicated stocking program

Comprehensive Services Portfolio

- Parts and spare valves
- Repair
- Field services
- Preventative maintenance
- Equipment testing and diagnostics
- Remanufacturing
- Asset preservation
- Customer property management
- Training and recertification services
- Warranty

Customized Total Valve Care℠ (TVC) Programs

Customized asset management plans that optimize uptime, availability and dedicated services.

- Engineering consultancy
- Site management
- Flange management
- Startup and commissioning
- Spare parts and asset management
- Operational support

About This Manual

This manual is a detailed *how to* reference for installing, piping, wiring, configuring, starting up, operating, maintaining, calibrating, and servicing Honeywell's family of ST 700 SmartLine Pressure Transmitters, Standard and Basic models.
Users who have a Honeywell ST 700 SmartLine Pressure Transmitter configured for HART protocol or Honeywell's Digitally Enhanced (DE) are referred to the *ST 700 Series HART/DE Option User's Manual*, Document # 34-ST-25-47.
Users who have a Honeywell ST 700 SmartLine Pressure Transmitter configured for Fieldbus operation are referred to the *ST 700 Series Fieldbus Option User's Manual*, Document # 34-ST-25-48.

The configuration of your Transmitter depends on the mode of operation and the options selected for it with respect to operating controls, displays and mechanical installation. This manual provides detailed procedures to assist first-time users, and it further includes keystroke summaries, where appropriate, as quick reference or refreshers for experienced personnel.

To digitally integrate a Transmitter with one of the following systems:

- For the Experion PKS, you will need to supplement the information in this document with the data and procedures in the *Experion Knowledge Builder.*
- For Honeywell's TotalPlant Solutions (TPS), you will need to supplement the information in this document with the data in the *PM/APM SmartLine Transmitter Integration Manual*, which is supplied with the TDC 3000 book set. (TPS is the evolution of the TDC 3000).

Release Information

ST 700 SmartLine Pressure Transmitter User Manual, Document # 34-ST-25-44,
Revision 1, February, 2013

Revision 2, May, 2013 – Updates to Parts list, Explosionproof Seal class, Fail Safe and Comms Module procedures.

Revision 3, July 2013 – Control Drawing updated to Rev.D

Revision 4, December 2013 – STG73P Flush Mount

Revision 5, December 2014 – MID and MARINE Approvals added

Revision 6, March 2016 – Standard Display added

Revision 7, May 2016 – Approval updates and EU cert.

Revision 8, December 2016 – Basic models added.

Symbol Descriptions and Definitions

The symbols identified and defined in the following table may appear in this document.

Symbol	Definition
	**ATTENTION: Identifies information that requires special consideration.**
	**TIP: Identifies advice or hints for the user, often in terms of performing a task.**
CAUTION	**Indicates a situation which, if not avoided, may result in equipment or work (data) on the system being damaged or lost, or may result in the inability to properly operate the process.**
	**CAUTION: Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.** **CAUTION symbol on the equipment refers the user to the product manual for additional information. The symbol appears next to required information in the manual.**
	**WARNING: Indicates a potentially hazardous situation, which, if not avoided, could result in serious injury or death.** **WARNING symbol on the equipment refers the user to the product manual for additional information. The symbol appears next to required information in the manual.**
	**WARNING, Risk of electrical shock: Potential shock hazard where HAZARDOUS LIVE voltages greater than 30 Vrms, 42.4 Vpeak, or 60 VDC may be accessible.**
	**ESD HAZARD: Danger of an electro-static discharge to which equipment may be sensitive. Observe precautions for handling electrostatic sensitive devices.**
	**Protective Earth (PE) terminal: Provided for connection of the protective earth (green or green/yellow) supply system conductor.**
	**Functional earth terminal: Used for non-safety purposes such as noise immunity improvement. Note: This connection shall be bonded to Protective Earth at the source of supply in accordance with national local electrical code requirements.**
	**Earth Ground: Functional earth connection. Note: This connection shall be bonded to Protective Earth at the source of supply in accordance with national and local electrical code requirements.**
	**Chassis Ground: Identifies a connection to the chassis or frame of the equipment shall be bonded to Protective Earth at the source of supply in accordance with national and local electrical code requirements.**
continued	

Symbol	Description
	The Factory Mutual®: Approval mark means the equipment has been rigorously tested and certified to be reliable.
	The Canadian Standards mark means the equipment has been tested and meets applicable standards for safety and/or performance.
	The Ex mark means the equipment complies with the requirements of the European standards that are harmonised with the 94/9/EC Directive (ATEX Directive, named after the French "ATmosphere EXplosible").

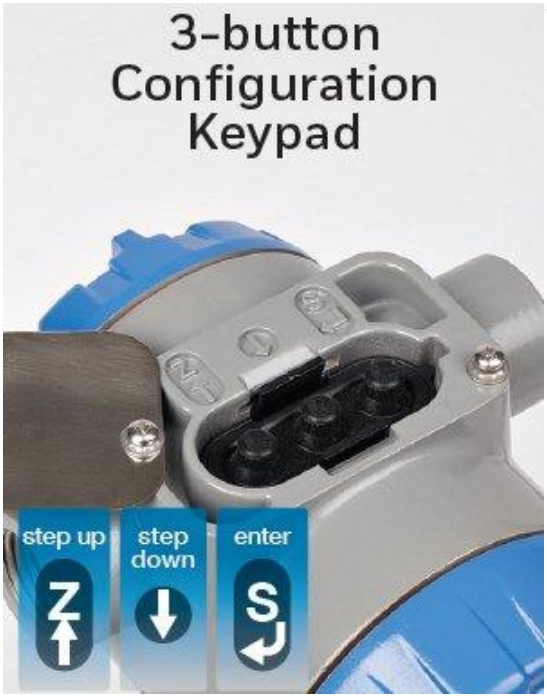
1. ST 700 Transmitter Series

1.1 Overview



SmartLine Pressure Transmitter ST 700 family conists of a series of ST 700 Standard Transmitter models and a series of ST 700 Basic Transmitter models.

The entire manual is broadly classified in two sections.
The first half of this manual, Sections **2** through **9**, are for ST 700 Standard Transmitter model series and the second half, Sections **10** through **17,** are applicable only to ST 700 Basic Transmitter model series.

Which type of transmitter do I have?
To determine which version you have:
Look at the nameplate on top of the unit shown in Figure 3. Refer to the Model number
If you have a ST 700 Standard Transmitter use Sections **2** through **9**.
If you have a ST 700 Basic Transmitter go straight to Sections **10** through **17.**
Appendix A - PRODUCT CERTIFICATIONS is applicable for both ST 700 Standard and Basic Transmitters.

Table 1 below to identify which type of Transmitter you have; Standard or Basic.

The Standard transmitter will have a three button assembly (see Figure 17), the basic Transmitter with have two button assembly (see Figure 18)

3-button Standard ST 700 Transmitter

2-button Basic ST 700 Transmitter

Table 1 – ST 700 Standard andf Basic model types

Transmitter Configuration	Smart Line Pressure ST700	
	Standard Models	Basic Models
Dual head DP	STD720/730/770	STD725/735/775
Dual head GP	STG730/740/770	STG735/745/775
Inline GP	STG73L/74L/77L/78L/79L	STG73S/74S/77S/78S/79S
Inline flush GP	STG73P	STG73SP
Dual head AP	STA722/740	STA725/745
Inline AP	STA72L/74L/77L	STA72S/74S/77S
Flush flanged level	STF724/732	STF725/735
Pseudo flanged level	STF72F/73F	STF72P/73P
Remote seal DP/GP	STR73D/74G	STR735D/745G

,

2. Introduction to the ST 700 Standard Transmitter

This section is an introduction to the physical and functional characteristics Honeywell's family of the ST 700 Standard Transmitters.

2.1 Features and Options

The ST 700 Standard Transmitter is available in a variety of models for measuring Differential Pressure (DP), Gauge Pressure (GP), and Absolute Pressure (AP). Table 2 lists the protocols, human interface (HMI), materials, approvals, and mounting bracket options.

Table 2 – Features and Options_ST 700 Standard transmitter

Feature/Option	Standard/Available Options
Communication Protocols	HART® version 7, Digitally Enhanced (DE), Fieldbus
Human-Machine Interface (HMI) Options (Basic Display/Standard Display)	**Basic Digital Display:** • Three-button programming (optional) • Basic display language: English only
	Standard Display (HART® only): • Two-button programming (optional) • Standard display language: English only • Two-mode operations: PV display and Menu Navigation
Calibration	Single
Approvals for details go to page 130	FM, CSA, ATEX, IECEx, SAEx, INMETRO, NEPSI, GOST and MARINE
Mounting Brackets	Angle/flat carbon steel/304 and 316 stainless steel, Marine 304 stainless steel, 316 Stainless Steel
Integration Tools	Experion

	The three-button option is available for the Basic Display. The two-button option is available for the Standard Display. Also, for the Basic Display, the three button reed switch is used only for span & zero correction and not for the Display navigation.

2.1.1 Physical Characteristics

As shown in Figure 1, the ST 700 Standard is packaged in two major assemblies: the Electronics Housing and the Meter Body. The elements in the Electronic Housing respond to setup commands and execute the software and protocol for the different pressure measurement types. Figure 2 shows the assemblies in the Electronics Housing with available options.

The Meter Body provides connection to a process system. Several physical interface configurations are available, as determined by the mounting and mechanical connections, all of which are described in the **Installation** section of this manual.

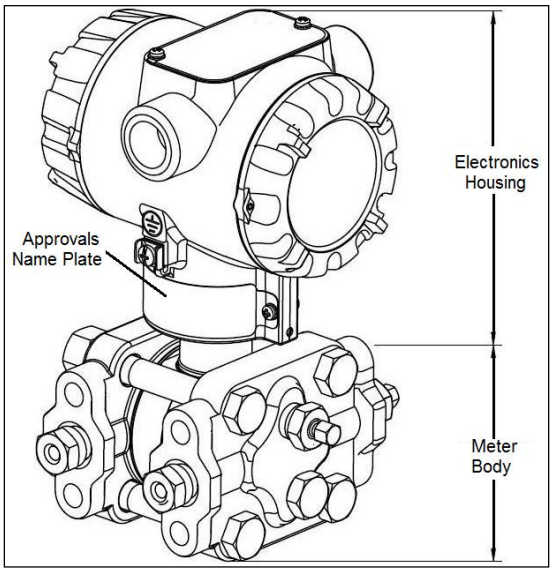


Figure 1 – ST 700 Standard Transmitter Major Assemblies

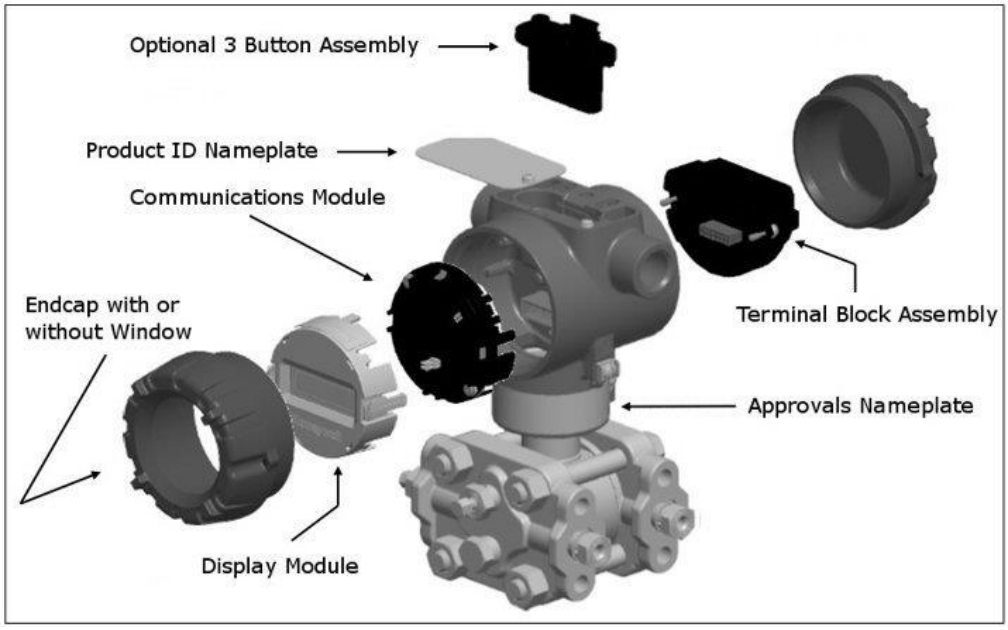

Figure 2 – ST 700 Standard Transmitter Electronics Housing Components

2.1.2 Functional Characteristics

The ST 700 Standard Transmitter measures process pressure and provides a proportional analog 4 to 20mA output to the measured process variable (PV). Available output communication protocols include Honeywell Digitally Enhanced (DE), HART®, and FOUNDATION™ Fieldbus.

The Standard display is only available on HART transmitters.

An optional 3-button assembly is available to set up and make adjustments to the Transmitter. In addition, a Honeywell Multi-Communication (MC) Toolkit (not supplied with the Transmitter) can facilitate setup and adjustment procedures. Certain adjustments can be made through an Experion Station or a Universal Station if the Transmitter is digitally integrated with Honeywell's Experion or TPS/TDC 3000 control system.

The Standard Display Menu is implemented as one long single-level menu and will "wrap around" when it reaches the start or end of the menu. The Standard Display uses an optional two-button assembly to set up and make adjustments to the Transmitter.

2.2 ST 700 Standard Transmitter Nameplate

The Transmitter nameplate mounted on the bottom of the electronics housing (see Figure 1) lists its model number, physical configuration, electronics options, accessories, certifications, and manufacturing specialties. Figure 3 is an example of a typical Gauge Pressure (GP) or Atmospheric Pressure (AP) Transmitter name plate. The model number format consists of a Key Number with several table selections. The Differential Pressure (DP), Absolute Pressure (AP), and Gauge Pressure (GP) name plates are essentially the same. The DP model provides one additional entry (7 vs. 6) in the Meter Body Selections (Table I) to accommodate the static pressure rating.

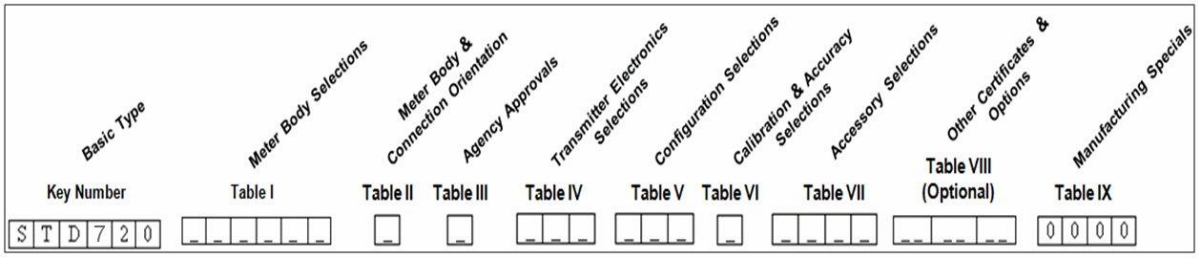

Figure 3 –ST 700 Standard Transmitter - Typical Name Plate

You can readily identify the series and basic Transmitter type from the third and fourth digits in the key number. The letter in the third digit represents one of these basic transmitter types:

- A = Absolute Pressure
- D = Differential Pressure
- F = Flange Mounted
- G = Gauge Pressure
- R = Remote Seals

For a complete selection breakdown, refer to the appropriate Specification and Model Selection Guide provided as a separate document.

2.3 Safety Certification Information

An “approvals” name plate is located on the bottom of the Electronics Assembly; see Figure 1for exact location. The approvals name plate contains information and service marks that disclose the Transmitter compliance information.
Refer to Section Appendix A in this document for safety certification requirements and details.

2.4 Transmitter Adjustments

Zero and Span adjustments are possible in ST 700 Standard Transmitter with the optional 3 button and two-button assemblies.

You can also use the Honeywell MC Toolkit or other third-party hand-held configurator to make adjustments to the ST 700 Standard Transmitter. Alternately, certain adjustments can be made through the Experion or Universal Station, if the Transmitter is digitally integrated with a Honeywell Experion or TPS system.

2.5 Display Options –Standard Display

Table 3 – Available Display Characteristics

Basic Display	• Suitable for basic process needs • 360^{o} rotation in 90^{o} Increments • 2 lines, 16 characters • Standard units of measurement: Pa, KPa, MPa, KGcm2, TORR, ATM, inH2O, mH2O, bar, mbar, inHg, FTH2O, mmH2O, MMHG, & PSI • Diagnostic messaging • Square root output indications
Standard Display	• 360^{o} rotation in 90^{o} Increments • 2 lines, 8 characters • Standard units of measurement: Pa, KPa, MPa, KGcm2, TORR, ATM, inH2O, mH2O, bar, mbar, inHg, FTH2O, mmH2O, MMHG, Flow Units (DP models only) ,PSI , cmH2O and mH2O • Diagnostic messaging

2.6 Optional Integrated Two-Button Assembly (Standard Display)

The Standard Display does not support all the transmitter configuration parameters and has limited features.
The optional Integrated two-Button Assembly for the Standard Display provides the following features and capabilities:

- Menu and enter key functionality.
- With the menu-driven display:
  - Comprehensive on-screen menu for navigation.
  - Transmitter configuration: enter LRV, enter URV and Loop Test.
  - Transmitter calibration
  - Display configuration (contrast only)
  - Set zero and span parameters.

	If you are using the optional external two-button assembly with the Standard Display then you can perform all the above operations without removing external glass cap using the external buttons

	**Lower range value (LRV):** A display parameter (Standard display), which allows users to enter the measuring value for which the analog output will be scaled to 4mA. **Upper range value (URV):** A display parameter (Standard display), which allows users to enter the measuring value for which the analog output will be scaled to 20mA.

3. Application Design for the ST 700 Standard Transmitter

3.1 Overview

This section discusses the considerations involved with deploying a Honeywell ST 700 Standard Transmitter in a process system. The following areas are covered:

- Safety
- Input and output data
- Reliability
- Environmental limits
- Installation considerations
- Operation and maintenance\
- Repair and replacement

3.2 Accuracy

The ST 700 Standard Transmitter measures the gauge, differential, or absolute pressure of a process and reports the measurement to a receiving device.

3.2.1 Diagnostic Messages

Transmitter standard diagnostics are reported in the two basic categories listed in Table 4. Problems detected as critical diagnostics drive the analog output to the programmed burnout level. Problems detected as non-critical diagnostics may affect performance without driving the analog output to the programmed burnout level. Informational messages (not listed in Table 4) report various Transmitter status or setting conditions. The messages listed in Table 4 are specific to the Transmitter, exclusive of those associated with HART and DE protocols. HART and DE diagnostic messages are listed and described in the *ST 700 SmartLine Pressure Transmitter HART/DE Option User Manual*, Document # 34-ST-25-47.

	**The Standard Display is only available on HART transmitters**

	**The Standard Display only displays critical diagnostics (Meter Body Fault, Electronics Module Fault and Meter Body Communication Fault). Non-critical diagnostics are not displayed.**

Table 4 – ST 700 Standard transmitter - Basic Display Diagnostics Messages

Critical Diagnostics (Failure Conditions)	Non-Critical Diagnostics (Warning Conditions)	
Sensor Comm Timeout	No DAC Compensation	No DAC Calibration
Meter Body Critical Failure	No Factory Calibration	Tamper Alarm
Electronic Module Diag Failure	PV Out of Range	Meter Body Unreliable Comm
Config Data Corrupt	Fixed Current Mode	Loop Current Noise
Meter Body NVM Corrupt	Sensor Over Temperature	AO Out of Range
Electronic Module DAC Failure	Meter Body Excess Correct	URV Set Error – Span Config Button
	Local Display	LRV Set Error – Span Config Button
	Low Supply Voltage	

3.3 Safety

3.3.1 Safety Integrity Level (SIL)

The ST 700 Standard transmitter has met manufacturer design process requirements of Safety Integrity Level (SIL) 3. These are intended to achieve sufficient integrity against systematic errors of design by the manufacturer.

A Safety Instrumented Function (SIF) designed with this product must not be used at a SIL level higher than the statement, without "prior use" justification by the end user or diverse technology redundancy in the design.

Refer to the *Honeywell SmartLine Safety Manual*, Document # 34-ST-25-37, for additional information.

4. Installation and Startupfor the ST 700 Standard Transmitter

4.1 Installation Site Evaluation

Evaluate the site selected for the ST 700 Standard Transmitter installation with respect to the process system design specifications and Honeywell's published performance characteristics for your particular model. Some parameters that you may want to include in your site evaluation are:

- Environmental Conditions:
  - Ambient Temperature
  - Relative Humidity
- Potential Noise Sources:
  - Radio Frequency Interference (RFI)
  - Electromagnetic Interference (EMI)
- Vibration Sources
  - Pumps
  - Motorized System Devices (e.g., pumps)
  - Valve Cavitation
- Process Parameters
  - Temperature
  - Maximum Pressure Rating

4.2 Honeywell MC Toolkit

In preparation for post-installation processes, refer to the *MC Tookit User Manual,* Document # 34-ST-25-20, for battery conditioning and device operation and maintenance information.

4.3 Display Installation Precautions

Temperature extremes can affect display quality. The display can become unreadable at temperature extremes; however, this is only a temporary condition. The display will again be readable when temperatures return to within operable limits.

The display update rate may become slower at cold temperature extremes, but as with readability, normal updating resumes when temperatures are within limits for full operability.

	The ST 700 Standard Transmitter should not be operated without the endcap covers on. Covers can be removed temporarily for configuration with buttons or during maintenance/wiring. The static voltage must be discharged before removing the cover.

4.4 Mounting ST 700 Standard Transmitters

4.4.1 Summary

The ST 700 Standard transmitter models, except flush mounts and those with integral flanges, can be attached to a two-inch (50 millimeters) vertical or horizontal pipe using Honeywell's optional angle or flat mounting bracket; alternately you can use your own bracket. Flush-mount models are attached directly to a process pipe or tank by a one-inch weld nipple. Models with integral flanges are supported by the flange connection.

Figure 4 shows a typical bracket-mounted and flange-mounted transmitter installations.

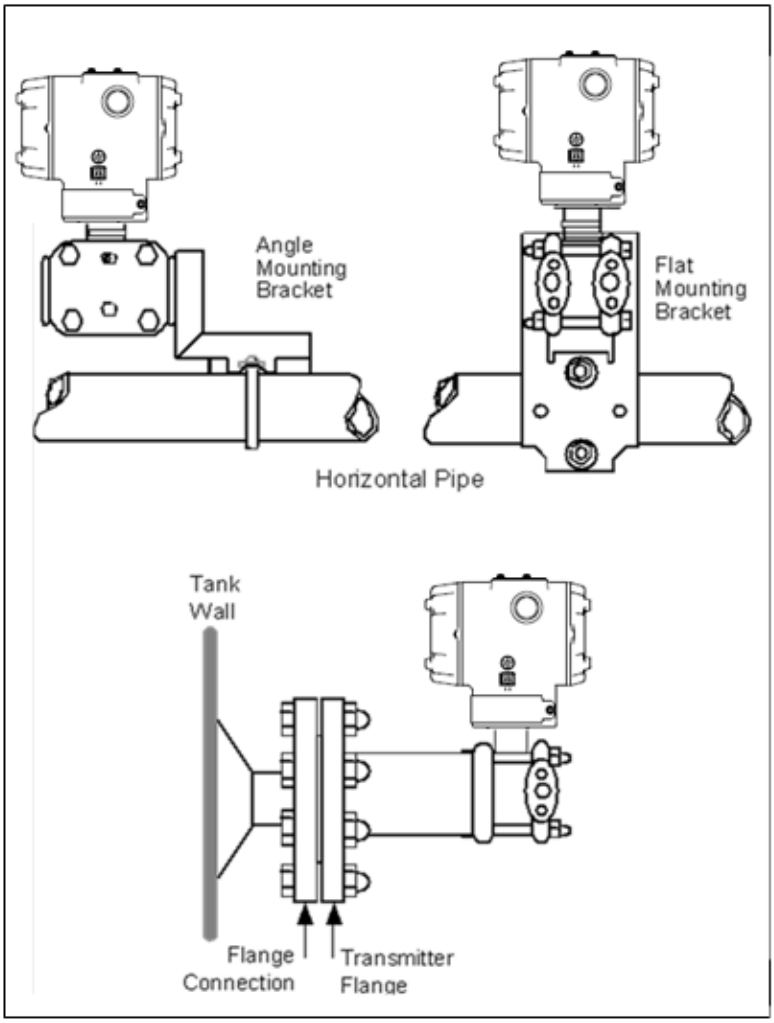

Figure 4 – ST 700 Standard Transmitter - Typical Bracket and Flange Mounted Installations

4.4.2 Flush mounting - ST 700 Standard Transmitter

To mount a flush mounted model, cut a hole for a 1" standard pipe in the tank or pipe where the transmitter is to be mounted. Weld the 1" mounting sleeve to the wall of the tank or to the hole cut on the pipe. Insert the meter body of the transmitter into the mounting sleeve and secure with the locking bolt. Tighten the bolt to a torque of 6,4 Nm +/- 0,30 Nm (4.7 ft-lbs +/- 0.2 ft.-lbs.). Figure 5 shows a typical installation for a transmitter with a flush mount on a pipe.

Once the transmitter is mounted, the electronics housing can be rotated to the desired position. See Figure 8 for details.

ATTENTION: On insulated tanks, remove enough insulation to accommodate the mounting sleeve.

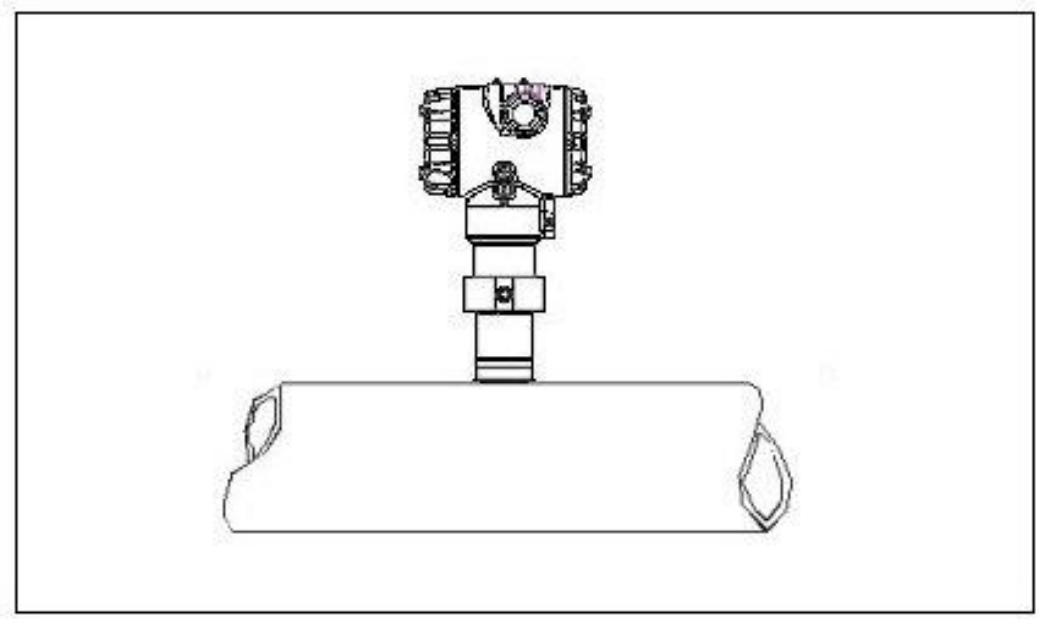

Figure 5 - ST 700 Standard Transmitter - Typical Flush Mounted Installation

4.4.3 Mounting Dimensions

Refer to Honeywell drawing number 50049930 (Dual Head), 50049931 (In-Line), 50049932 (Flange Mount) 50049933 (Extended Flange), 50049934 (Remote Seal) and 50049936 (Flush Mount Pressure Transmitter) for detailed dimensions. Abbreviated overall dimensions are also shown on the Specification Sheets for the transmitter models. This section assumes that the mounting dimensions have already been taken into account and the mounting area can accommodate the Transmitter.

4.4.4 Bracket Mounting Procedure

If you are using an optional bracket, start with Step 1. For an existing bracket, start with Step 2.

1. Refer to Figure 6. Position the bracket on a 2-inch (50.8mm nominal diameter, 2.38" (60.4mm) actual OD) for a horizontal or vertical pipe, and install a "U" bolt around the pipe and through the holes in the bracket. Secure the bracket with the nuts and lock washers provided.

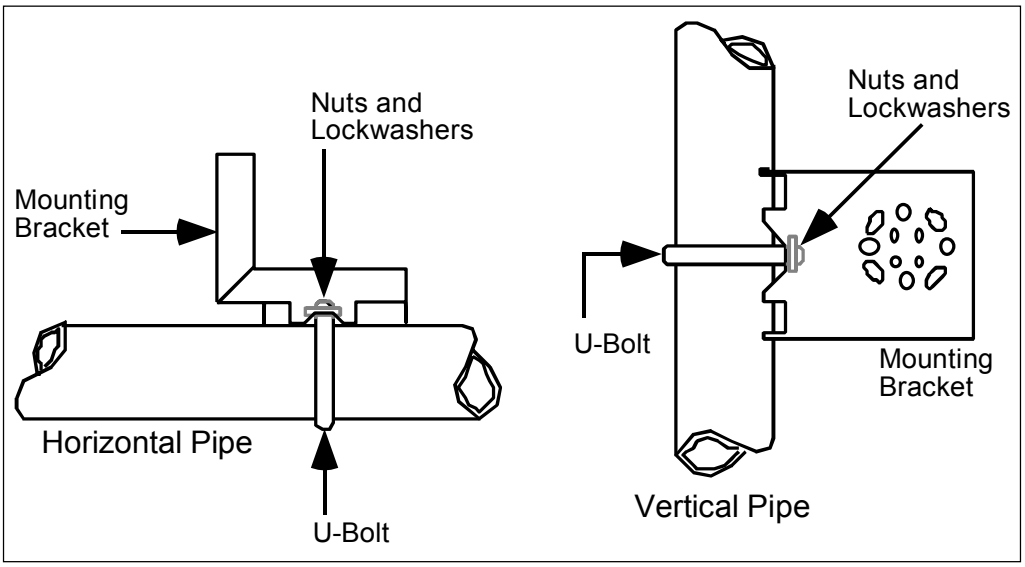

Figure 6 – ST 700 Standard Transmitter - Angle Mounting Bracket Secured to a Horizontal or Vertical Pipe

2. Align the appropriate mounting holes in the Transmitter with the holes in the bracket. Use the bolts and washers provided to secure the Transmitter to the bracket; see the following variations.

Table 5 - ST 700 Standard Transmitter - Mounting Bracket procedure

Transmitter Type	Use Hardware
DP with double-ended process heads and/or remote seals	Alternate mounting holes in the ends of the heads
ST 700 Standard transmitter models only. In-line GP: STG7x0 and STG7xL AP models: STA7xL and STA72x, STA740	The smaller "U" bolt provided to attach the meter body to the bracket. See the following example.
Dual-head GP and AP	Mounting holes in the end of the process head.

Example: Inline model mounted to an optional angle bracket. See Figure 7**.**

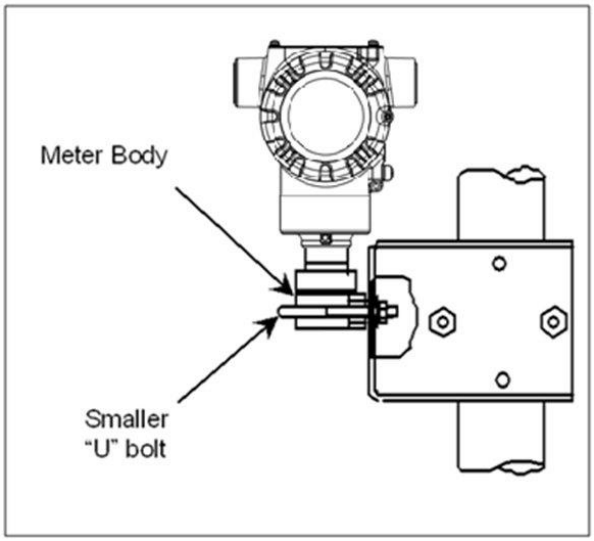

Figure 7 – ST 700 Standard Transmitter - Inline Model Mounted to an Optional Bracket

3. Loosen the set screw on the outside neck of the Transmitter one (1) full turn.

4. Rotate the Electronics housing a maximum of 180° left or right from the center to the position you require, and tighten the set screw using a 4mm metric socket head wrench. See the following example and Figure 8.

   Example: Rotating the Electronics Housing

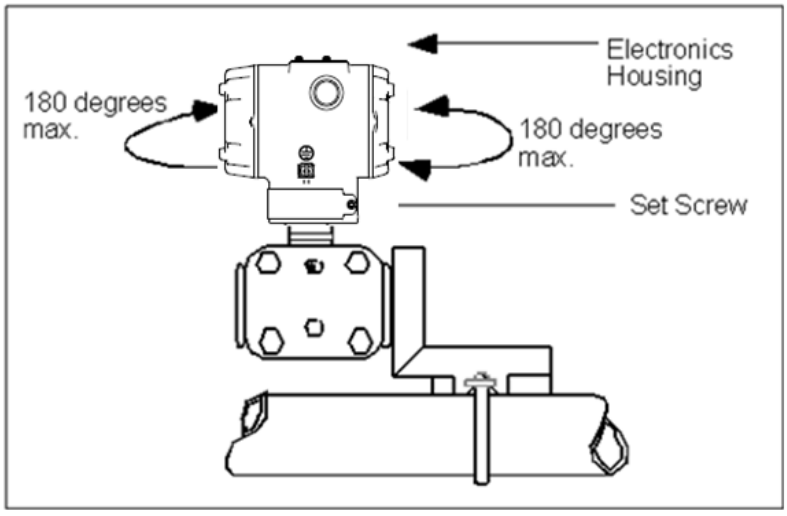

Figure 8 – ST 700 Standard Transmitter - Rotating the Electronics Housing

The mounting position of AP models STA722 and STA72L becomes critical as the Transmitter spans become smaller. A maximum zero shift of 2.5mmHg for these models can result from a mounting position that is rotated 90o from the vertical.
A typical zero-shift of 0.12mmHg or 0.20 inH_2O can occur for a five (5)-degree rotation from the vertical.

4.4.5 Mounting Transmitters with Small Absolute or Differential Pressure Spans

To minimize positional effects on calibration (zero shift), take the appropriate mounting precautions for the respective Transmitter model. Ensure that the Transmitter is vertical when mounting models STA722 and STA72L. You do this by leveling the Transmitter side-to-side and front-to-back. **Figure 9** shows how to level a Transmitter using a spirit level.

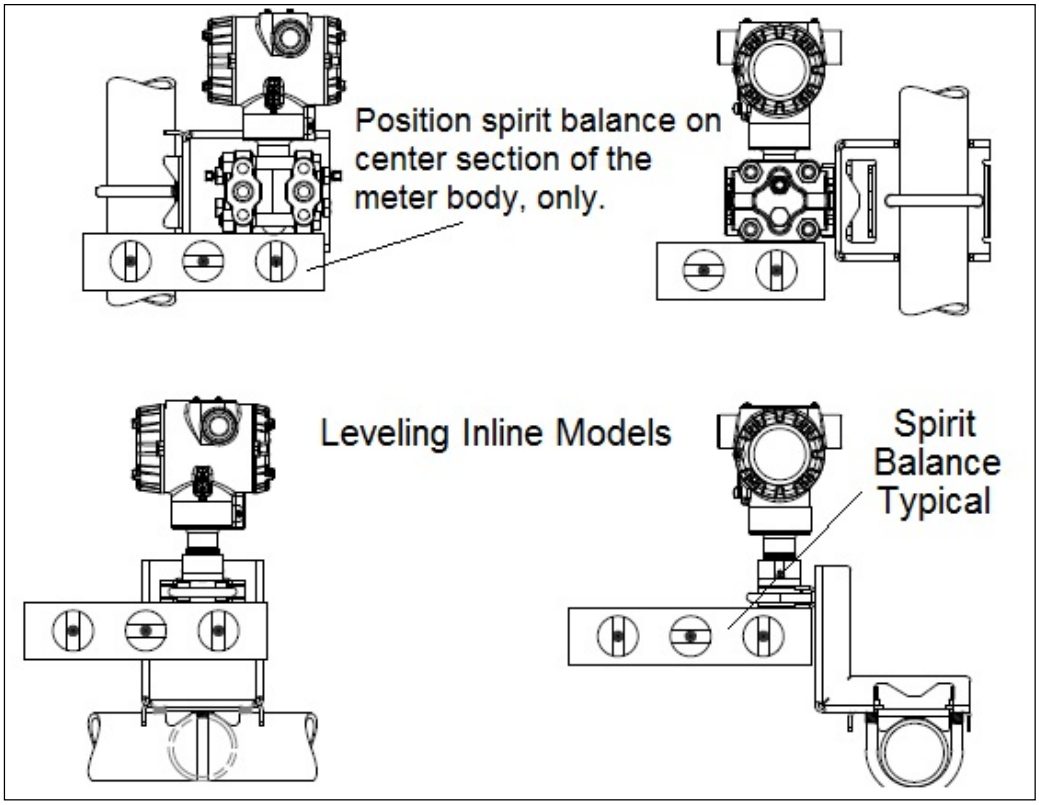

Figure 9 – ST 700 Standard Transmitter - Using a Spirit Balance to Level a Transmitter

4.4.6 Flange Mounting

Figure 10 shows a typical tank-flange mount installation, with the Transmitter flange mounted to the pipe on the wall of the tank.

On insulated tanks, remove enough insulaiton to accommodate the flange extension.

When flange-mounting to a tank, note the following:

- The End User is responsible for providing a flange gasket and mounting hardware suitable for the Transmitter service conditions.
- To avoid degrading performance in flush-mounted flanged Transmitters, exercise care to ensure that the internal diameter of the flange gasket does not obstruct the sensing diaphragm.
- To prevent performance degradation in extended-mount flanged Transmitters, ensure that sufficient clearance exists in front of the sensing diaphragm body.

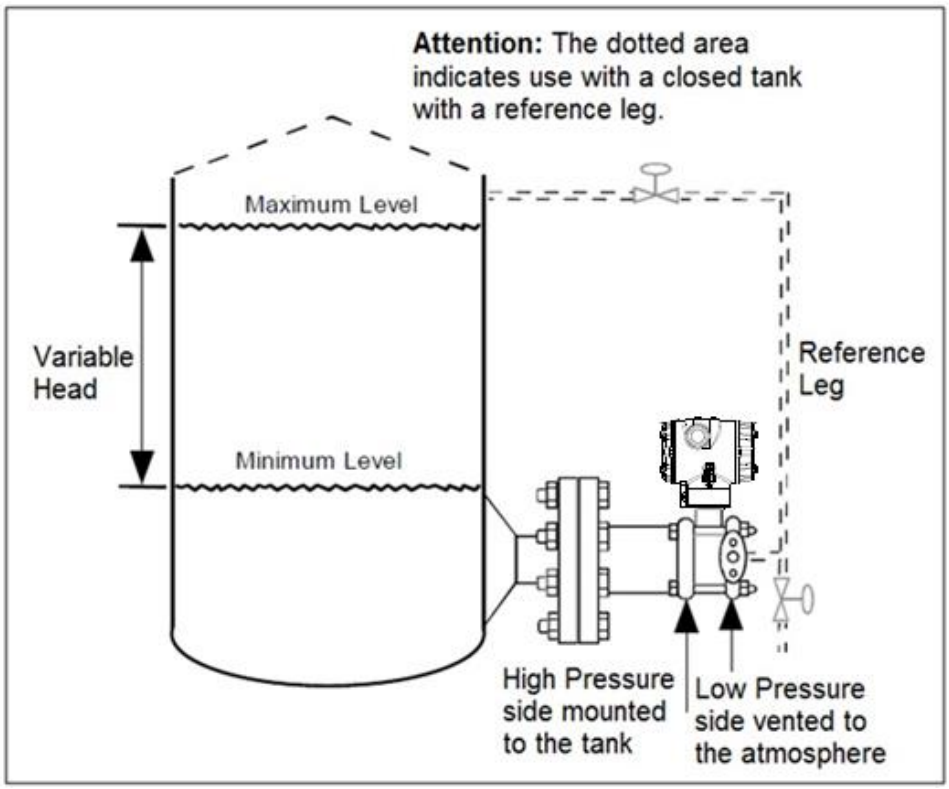

Figure 10 – ST 700 Standard Transmitter - Tank-Flange Mounted Transmitter

4.4.7 Remote Diaphragm Seal Mounting Information

The combination of tank vacuum and high pressure capillary head effect should not exceed nine (9) psi (300mmHg) absolute. For insulated tanks, be sure to remove enough insulation to accommodate the flange extension. The end user is responsible for supplying a flange gasket and mounting hardware suitable for the service condition of the Transmitter.

Mount the Transmitter flanges within the limits in **Table 6** for the fill fluid in the capillary tubes, with a tank at one (1) atmosphere.

Table 6 – ST 700 Standard Transmitter - Flange Mounting Guidelines

Fill Fluid	Mount the Flange…
Silicone 200 Oil	≤22 feet (6.7 meters) below the Transmitter
Chlorotrifluorethylene (CTFE)	≤11 feet (3.4 meters) below the Transmitter

Refer to Figure 11 for a representative remote diaphragm seal installation. Mount the Transmitter at a remote distance determined by the length of the capillary tubing.

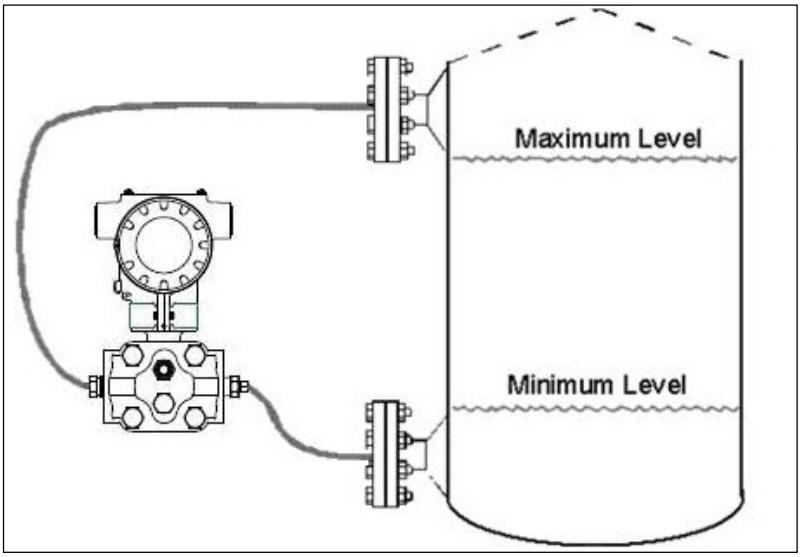

Figure 11 – ST 700 Standard Transmitter - Representative Remote Diaphragm Seal Transmitter Installation

Depending on Transmitter model, connect the remote seal to the tank according to Table 7.

Table 7 – ST 700 Standard Transmitter - Remote Diaphragm Mounting Details

Transmitter Model	Connect the Remote Seal on ….	
	Variable Head	Fixed or Constant Head
STR73D	Transmitter High Pressure (HP) Side to tank wall lower flange mounting.	Transmitter Low Pressure (LP) side to tank wall upper flange.

4.5 Piping the ST 700 Standard Transmitter

4.5.1 Piping Arrangements

Piping arrangements vary depending upon process measurement requirements and the Transmitter model. For example, a differential pressure transmitter comes with double-ended process heads with ¼-inch NPT connections, which can be modified to accept ½-inch NPT through optional flange adapters. Gauge pressure transmitters are available with various connections for direct mounting to a process pipe.

A ½-inch, schedule 80, steel pipe is commonly used for Transmitter integration into a process system. Many piping arrangements use a three-valve manifold to connect the process piping to the Transmitter. A manifold makes it easy to install and remove or re-zero a Transmitter without interrupting the process. A manifold also accommodates the installation of blow-down valves to clear debris from pressure lines. Figure 12 represents a typical piping arrangement using a three-valve manifold and blow-down lines for a differential pressure transmitter being used to measure flow.

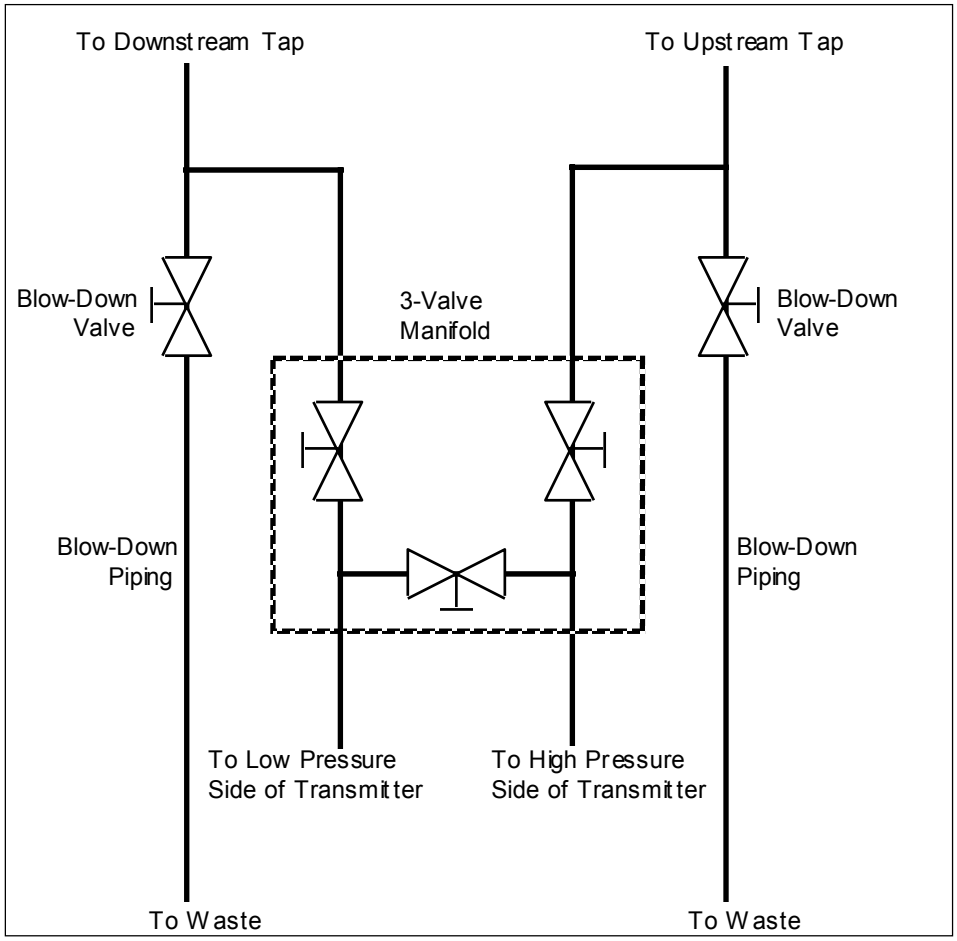

Figure 12 – ST 700 Standard Transmitter - Typical 3-Valve Manifold with Blow-Down Piping

4.5.2 Transmitter Location

The following are suggested connections based on what is being processed by the system.

Table 8 – ST 700 Standard Transmitter - Suggested Connection Locations

Process	Suggested Location	Description
Gases	Above the gas line.	The condensate drains away from the Transmitter.
Liquids	Below but near the elevation of the process connection.	This minimizes that static head effect of the condensate.
	Level with or above the process connection.	This requires a siphon to protect theTransmitter from process steam. The siphon retains water as a *fill fluid*.

1. For liquid or steam, the piping should slope a minimum of 25.4mm (1 inch) per 305mm (1 foot).
2. Slope the piping down toward the Transmitter if it is below the process connection to allow the bubbles to rise back into the piping through the liquid.
3. If the transmitter is located above the process connection, the piping should rise vertically above the Transmitter. In this case, slope down toward the flow line with a vent valve at the high point.
4. For gas measurement, use a condensate leg and drain at the low point (freeze protection may be required here).

ATTENTION Care must be taken when installing transmitters on hot processes. The operating temperature limits for the device (as outlined in Table 5) must not be exceeded. Impulse piping may be used to reduce the temperature of the process that comes into contact with the transmitter meter body. As a general rule there is a 56°C drop (100°F) in the temperature of the process for every foot of ½ inch uninsulated piping.

4.5.3 General Piping Guidelines

- When measuring fluids that contain suspended solids, install permanent valves at regular intervals to blow-down piping.
- Blow-down all lines on new installations with compressed air or steam, and flush them with process fluids (where possible) before connecting these lines to the Transmitter Meter body.
- Verify that the valves in the blow-down lines are closed tightly after the initial blow-down procedure and each maintenance procedure thereafter.

4.5.4 Procedure to Install Flange Adapters

The following procedure provides the steps for removing and replacing an optional flange adapter on the process head. Refer to Figure 13.

This procedure does not require that the Meter body be removed from the Electronics Housing. If flange adapters are being replaced with parts from other kits (for example, process heads), follow the procedures for the kits and incorporate the following procedure.

The threaded hole in each Flange Adapter is offset from center. To ensure proper orientation for re-assembly, note the orientation of the offset relative to each Process Head **before removing the adapter**.

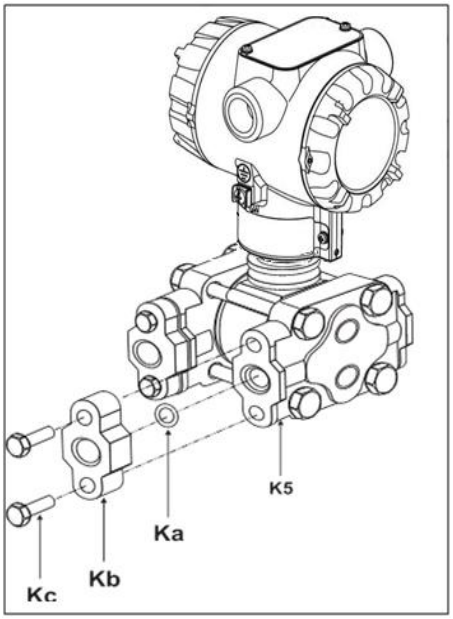

Figure 13 – ST 700 Standard Transmitter - Flange Adapter Removal and Replacement

Refer to the instructions included with the kit for removal and replacement procedures.

4.6 Wiring the ST 700 Standard Transmitter

4.6.1 Overview

The transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range shown in Figure 14.

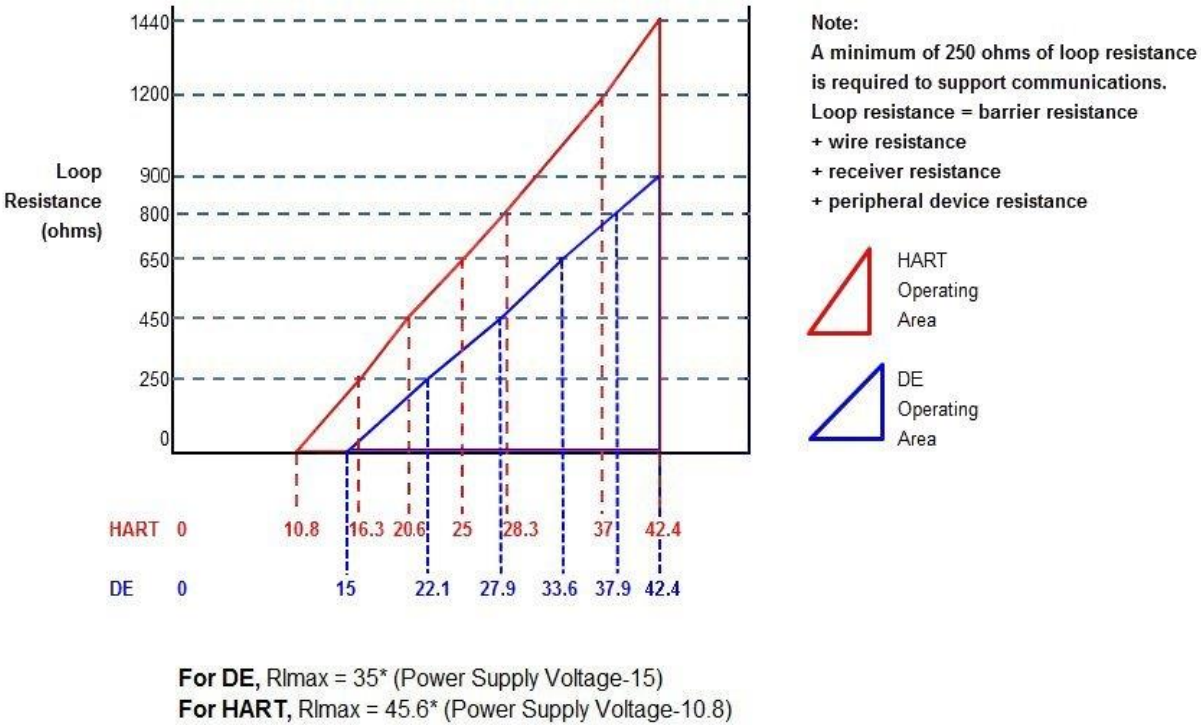

Figure 14 – ST 700 Standard Transmitter - Operating Ranges

Loop wiring is connected to the Transmitter by simply attaching the positive (+) and negative (–) loop wires to the positive (+) and negative (–) terminals on the Transmitter terminal block in the Electronics Housing shown in Figure 15.

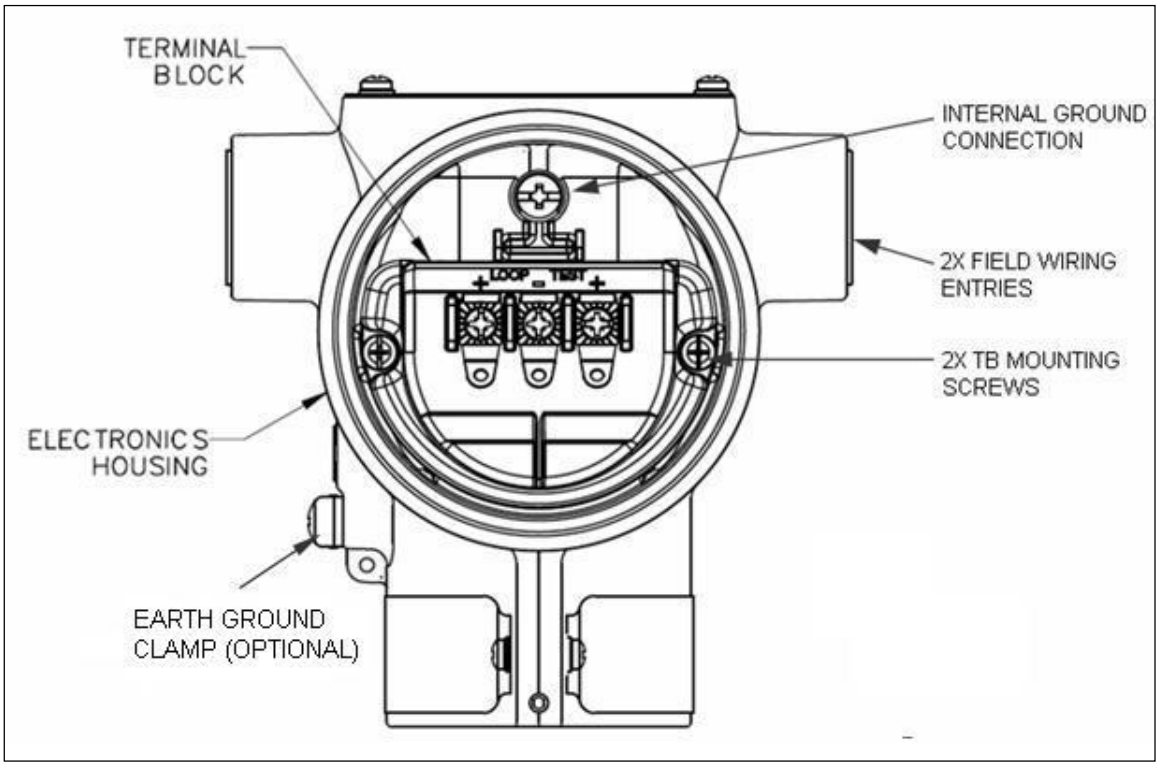

Figure 15 – ST 700 Standard Transmitter - 3-Screw Terminal Board and Grounding Screw

As shown in Figure 15, each Transmitter has an internal terminal to connect it to earth ground. Optionally, a ground terminal can be added to the outside of the Electronics Housing. While it is not necessary to ground the Transmitter for proper operation, doing so tends to minimize the possible effects of noise on the output signal and affords protection against lightning and static discharge. An optional lightning terminal block can be installed in place of the non-lightning terminal block for Transmitters that will be installed in an area that is highly susceptible to lightning strikes.

Wiring must comply with local codes, regulations and ordinances. Grounding may be required to meet various approval body certification, for example CE conformity. Refer to Appendix A of this document for details.

Note: The right hand terminal is for loop test and is not applicable for the Fieldbus option.

The Transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range; see

Figure 14. With optional lightning protection and/or a remote meter, the voltage drop for these options must be added to the basic 10.8-volt supply requirements to determine the required Transmitter voltage (V_{XMTR}) and maximum loop resistance ($R_{LOOP\ MAX}$). Additional consideration is required when selecting intrinsic safety barriers to ensure that they will supply at least minimum

Transmitter voltage ($V_{XMTR\ MIN}$), including the required 250 ohms of resistance (typically within the barriers) needed for digital communications.

Transmitter loop parameters are as follows:
$R_{LOOP\ MAX}$ = maximum loop resistance (barriers plus wiring) that will allow proper Transmitter operation and is calculated as $R_{LOOP\ MAX} = (V_{SUPPLY\ MIN} - V_{XMTR\ MIN}) \div 21.8mA$.

In this calculation:

$V_{XMTR\ MIN} = 10.8V + V_{LP} + V_{SM}$
$V_{LP} = 1.1V$, lightning protection option, LP
$V_{SM} = 2.3V$, remote meter

Note that V_{SM} should only be considered if a remote meter will be connected to the transmitter.
The positive and negative loop wires are connected to the positive (+) and negative (–) terminals on the terminal block in the Transmitter Electronics Housing.

Barriers can be installed per Honeywell's instructions for Transmitters to be used in intrinsically safe applications.

4.6.2 Digital System Integration Information

Transmitters that are to be digitally integrated to Honeywell's Total Plant Solution (TPS) system will be connected to the Pressure Transmitter Interface Module in the Process Manager, Advanced Process Manager or High Performance Process Manager through a Field Termination Assembly. Details about the TPS system connections are given in the *PM/APM SmartLine Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

If you are digitally integrating a Transmitter in an Allen Bradley Programmable Logic Controller (PLC) process system, the same Field Terminal Assembly (FTA) and wiring procedures used with Honeywell's TPS system are also used with the Allen-Bradley 1771 and 1746 platforms.

4.6.3 Wiring Variations

The above procedures are used to connect power to a Transmitter. For loop wiring and external wiring, detailed drawings are provided for Transmitter installation in non-intrinsically safe areas and for intrinsically safe loops in hazardous area locations.

If you are using the Transmitter with Honeywell's TPS system, see *PM/APM Smartline Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

4.6.4 Wiring Procedure

1. See Figure 15, above, for parts locations. Loosen the end cap lock using a 1.5mm Allen wrench.
2. Remove the end cap cover from the terminal block end of the Electronics Housing.
3. Feed loop power leads through one end of the conduit entrances on either side of the Electronics Housing. The Transmitter accepts up to 16AWG wire.
4. Plug the unused conduit entrance with the appropriate plug for the environment.
5. Connect the positive loop power lead to the positive (+) terminal and the negative loop power lead to the negative (-) terminal. Note that the Transmitter is <u>not</u> polarity-sensitive.
6. Replace the end cap, and secure it in place.

4.6.5 Lightning Protection

If your Transmitter includes the optional lightning protection, connect a wire from the Earth Ground Clamp (see Figure 15) to Earth Ground to make the protection effective. Use a size 8 AWG or (8.37mm^2) bare or green covered wire for this connection.

4.6.6 Supply Voltage Limiting Requirements

If your Transmitter complies with the ATEX 4 directive for self-declared approval per 94/9EC, the power supply has to include a voltage-limiting device. Voltage must be limited such that it does not exceed 42V DC. Consult the process design system documentation for specifics.

4.6.7 Process Sealing

The ST 700 SmartLine Pressure Transmitter is CSA-certified as a Dual Seal device in accordance with ANSI/ISA–12.27.01–2003, "Requirements for Process Sealing Between Electrical Systems and Flammable, or Combustible Process Fluids."

4.6.8 Explosion-Proof Conduit Seal

 When installed as explosion proof in a Division 1 Hazardous Location, keep covers tight while the Transmitter is energized. Disconnect power to the Transmitter in the non-hazardous area prior to removing end caps for service.

When installed as non-incendive equipment in a Division 2 hazardous location, disconnect power to the Transmitter in the non-hazardous area, or determine that the location is non-hazardous before disconnecting or connecting the Transmitter wires.

Transmitters installed as explosion proof in Class I, Division 1, Group A Hazardous (classified) locations in accordance with ANSI/NFPA 70, the US National Electrical Code, with 1/2 inch conduit do not require an explosion-proof seal for installation. If 3/4 inch conduit is used, a LISTED explosion-proof seal to be installed in the conduit, within 18 inches (457.2mm) of the Transmitter.

4.7 Startup – ST 700 Standard Transmitter

4.7.1 Overview

This section identifies typical start up tasks associated with several generic pressure measurement applications. It also includes the procedure for running an optional analog output check.

4.7.2 Startup Tasks

After completing the installation and configuration tasks for a Transmitter, you are ready to start up the process loop. Startup usually includes:

- Checking zero input
- Reading inputs and outputs
- Applying process pressure to the transmitter.

You can also run an optional output check to *wring out* an analog loop and check out individual Process Variable (PV) outputs in Digitally Enhanced (DE) mode before startup.

The actual steps in a startup procedure vary based on the type of Transmitter and the measurement application. In general, the procedures in this section are based on using Honeywell MC Toolkit to check the Transmitter input and output under static process conditions, and make adjustments as required initiating full operation with the running process. Note that similar checks can be made using the optional three-button assembly, where the Transmitter is equipped. Operation with the three-button assembly is discussed in the Operation section.

When the Standard Display is connected, the two-button assembly for the Standard Display is present. The buttons will function 1 second after powering up.

4.7.3 Output Check Procedures

The Output Check comprises the following procedures:

- The Loop Test procedure checks for continuity and the condition of components in the output current loop.
- The Trim DAC Current procedure calibrates the output of the Digital-to-Analog converter for minimum (0%) and maximum (100%) values of 4mA and 20mA, respectively. This procedure is used for Transmitters operating online in analog mode to ensure proper operation with associated circuit components (for example, wiring, power supply, control equipment). Precision test equipment (an ammeter or a voltmeter in parallel with precision resistor) is required for the Trim DAC Current procedure.
- The Apply Values procedure uses actual Process Variable (PV) input levels for calibrating the range of a Transmitter. To measure a liquid level for example, a sight-glass can be used to determine the minimum (0%) and maximum (100%) level in a vessel. The PV is carefully adjusted to stable minimum and maximum levels, and the LRV and URV are then set by commands from the MC Toolkit.

The Transmitter does not measure the given PV input or update the PV output while it operates in the Output mode.

4.7.4 Constant Current Source Mode Procedure

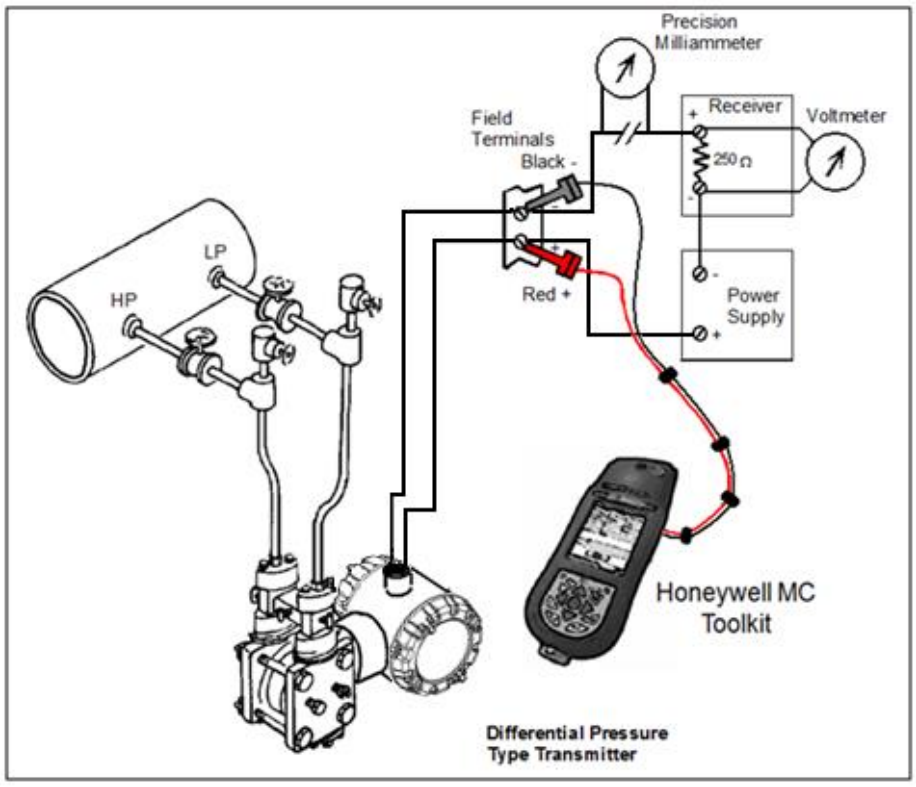

Figure 16 – ST 700 Standard Transmitter - Current Loop Test Connections

1. Refer to Figure 16 for test connections. Verify the integrity of electrical components in the output current loop.
2. Establish communication with the Transmitter. For these procedures, the values of components in the current loop are not critical if they support reliable communication between the Transmitter and the Toolkit.
3. On the Toolkit, display the **Output Calibration** box.
4. In the Output Calibration box, select the **Loop Test** button; the **LOOP TEST** box will be displayed.
5. Select the desired constant-level Output: 0%, 100%, or Other (any between 0% - 100%).
6. Select the Set button. A box will be displayed asking **Are you sure you want to place the transmitter in output mode?**

With the Transmitter in Analog mode, you can observe the output on an externally-connected meter or on a local meter. In DE mode, you can observe the output on the local meter or on the Toolkit Monitor display.

7. Select the **Yes** button. Observe the output current at the percentage you selected in Step 5.
8. To view the monitor display, navigate back from the **LOOP TEST** display, and select the **MONITOR** display. A **Confirm** popup will be displayed.
9. Select **Yes** to continue. This concludes the Startup procedure.

5. Operation_ST 700 Standard Transmitter

5.1 Overview

This section provides the information and processes involved for both Digitally Enhanced (DE) and HART operation using the three-button Basic and two-button Standard options for the ST 700 Standard transmitter.

5.2 Three-Button Operation

The ST 700 Standrad transmitter has optional three-button interface that provides a user interface and operation capability without opening the transmitter. Figure 17 shows the location of the three-button option and the labels for each button.

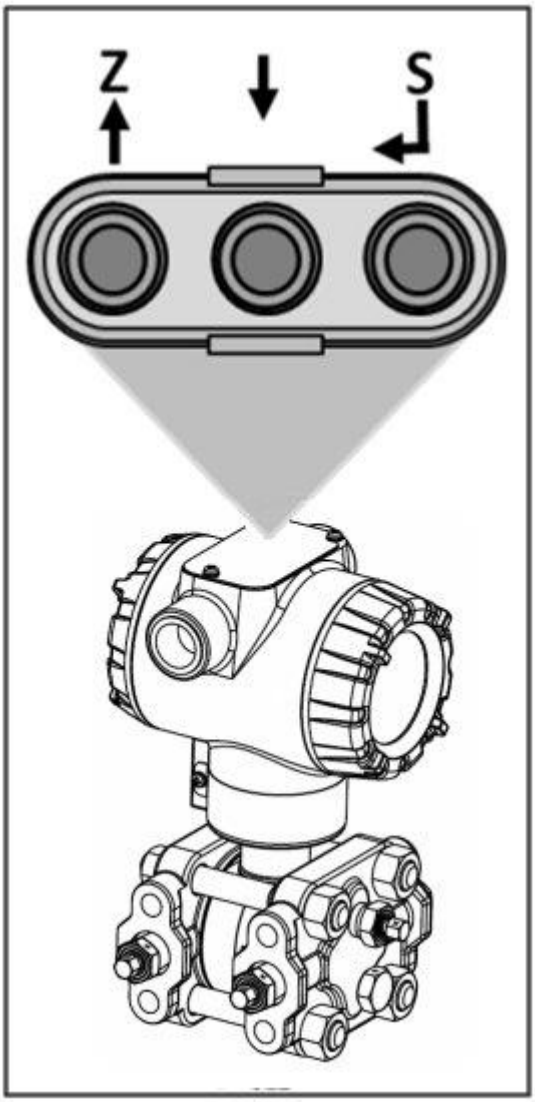

Figure 17 – ST 700 Standard Transmitter - Three-Button Option

Table 9 – Three-Button Option Functions

Physical Button	Basic Display	Action
Left ↑	Increment Previous Menu Item	Scroll to previous menu item in an active list. Scroll through alphanumeric list to desired character (ex. for entering Tag names or numeric values)
Center ↓	Decrement Next Menu Item	Scroll to next menu item in an active list. Scroll through alphanumeric list to desired character (ex. for entering Tag names or numeric values)
Right ↵	Select displayed menu item for activation or editing	Call up the Main Menu. Select an item for data entry. Confirm a data entry operation Activate the service associated with a selected menu item.

5.2.1 The Basic Display Menu

The Basic Display Menu is implemented as one long single-level menu and will "wrap around" when it reaches the start or end of the menu. Operation is as follows:

Press the ↵ button to call up the Menu.

1. Select **<Exit Menu>** and press ↵ to exit the Menu.
2. Use the ↑ and ↓ buttons to scroll through the list of menu items.
3. Press the ↵ button to select an item for data entry or activation. When an item is selected for data entry or activation, the cursor will jump to the lower line of the LCD to allow editing of the value. No action is taken against a menu item until the user presses the ↵ button.
4. If you want to abort a data entry operation, simply refrain from pushing any buttons for 10 seconds; the data entry operation will time out and the original value of the selected item will be preserved.

Table 10 – The Basic Display Menus

LCD Contrast	»»»»»»	Adjust the LCD contrast level. Range from » (1) to »»»»»»»»»» (9) Default: »»»»»»»»(7)		Press ↵ to enter menu selection ↑ and ↓ to select level. ↵ to enter
PV Display	Pressure	Pressure Units	Select Process Variable (PV) to be shown on the display from list.	
	Percent Output	%		
	Loop Output	mA		
PV Decimal	None	Select the PV decimal resolution to be shown on selected screen from list.		
	X.X			
	X.XX			
	X.XXX			
Pressure Units	atm, bar ftH2O @ 68ºF gf/cm2 inH2O @ 39ºF inH2O @ 60ºF inH2O @ 68ºF inHg @ 0ºC kgf/cm2, kPa mbar, mmH2O @ 4ºC, mmH2O @ 68ºF, mmHg @ 0ºC, MPa, Pa, psi Torr, mHg @ 0ºC	Choose appropriate engineering units from list		Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Zero Correct	Do Correct	Executing this selection corrects the Zero based on the input pressure		Press ↵ to enter menu selection Press ↵ to initiate action
LRV Correct	Do Correct	Executing this selection corrects the LRV based on the input pressure		
URV Correct	Do Correct	Executing this selection corrects the LRV based on the input pressure		
Reset Corrects	Do Correct	Executing this selection Resets the Zero, LRV, and URV Corrects back to Factory values		
DAC Zero Trim Note: Loop must be removed from Automatic Control	DAC Zero Trim	This selection allows the loop zero output 4mA value to be trimmed. Note: You must connect a current meter to the transmitter to monitor the loop output.		Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to the next digit to the right
DAC Span Trim Note: Loop must be removed from Automatic Control	DAC Span Trim	This selection allows the loop span output 20mA value to be trimmed. Note: You must connect a current meter to the transmitter to monitor the loop output.		

Loop Test Note: Loop must be removed from Automatic Control	Loop Test 12.000	This selection allows the user to force the DAC output to any value between 3.8 and 20.8 mA. Note: This selection will put the DAC into Fixed Output Mode, as indicated by the flashing output value. Navigation away from this menu item will return the loop to Normal (Automatic) Mode.	
LRV URV	#. ## #. ##	The limits are: 2X the Lower Range Limit (LRL) of the Meter body and 2X the Upper Range Limit (URL) of the Meter body	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to the next digit to the right
Damping	#. ##	Selection applies digital filtering to suppress noise effects on the PV. The limits for this value are 0.0 to 32.0 seconds	
NAMUR	Enabled Disabled	Disabling sets the loop output and burnout levels to the Honeywell levels	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Filter Perf	Fast SOR Standard SOR	Fast Speed of Response Standard Speed of Response	
Transfer Function (only available for DP Transmitters)	Linear	The loop output of the transmitter is a linear representation of the differential pressure	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character to the right.
	Square Root	The loop output of the transmitter represents %Flow as defined by the DP Square Root flow equation.	
Flow Cutoff	Single Breakpt	Allows the user to specify a single breakpoint as the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	
	Dual Slope	Uses a dual slope formula to determine the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	

Flow Breakpoint	##. #%	Enter the low flow cutoff point when Single Breakpt is selected. Range: 0 to 25.0 %Flow.	
Tag ID	□□□□□□□□	Enter Tag ID name up to 8 characters long. □ = any Alphanumeric value	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character to the right.
Device ID	Unique for each device		Read Only
PV Units	Units of transmitted PV		
Install Date	DD MM YYYY	This selection allows the user to enter the date a transmitter is installed. The Install Date is entered in sequence of Day, Month, and Year, followed by the new date and the prompt Write Date to confirm the entry. **CAUTION**: The Install Date can only be written once in the life of the Transmitter. You cannot erase or overwrite the Install Date once it has been written.	Press ↵ to enter menu selection ↑ and ↓ to select number ↵ to enter and shift to next digit to the right. Read Only after entered
Firmware	Display Electronics Meterbody	Menu item shows the current Firmware versions of the Display, Electronics Module and the Meter body	Read Only Parameter
Protocol	HART DE	Menu item shows the communications protocol	
Model Key		Identifies the type and range of the transmitter	Read Only Parameter
<Exit Menu>			

5.2.2 Data Entry

Data entry is performed from left to right. Select a character / digit by pressing ↑ or ↓ buttons, and then press ↵ to advance to the next character position to the right. Select the cross-hatch character ▒ to terminate the entry or if the final character is already a space character, just press **<<** again.

All numeric entries are clamped at the low or high limit if needed. You can determine the low and high limit for a parameter by selecting either the **H** or **L** character while the cursor is positioned over the left-most digit and press ↵ button. The Display will show the selected limit.

Table 11 – Three-Button Data Entry

Screen Symbol	Numeric data entry	Text entry
H	Display the high limit for this parameter. This symbol only appears in the left-most position of the data entry field.	Not Available
L	Display the low limit for this parameter. This symbol only appears in the left-most position of the data entry field.	Not Available
<<	Terminate the numeric entry	Terminate the text entry
0 thru 9, Minus, Decimal	These characters are used to enter numeric values. The minus sign only appears in the left-most digit.	These characters can be used to enter the Tag ID

5.2.3 Editing a Numeric value

Editing of a numeric value is a digit-by-digit process, starting with the left-most digit.

1. Press ↵ to begin the edit process.
2. The Basic Display will show the current value of the item on the lower line, left justified. The
3. Press the ↑ or ↓ buttons to select the desired digit, and then press ↵ to advance to the next digit to the right.
4. After the last digit has been entered, press ↵ one more time to write the new value to the transmitter.

5.2.4 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g., PV Display, Pressure Units, etc.).

1. Press ↵ to begin the edit process.
    a. The Basic Display will show the current setting of the item on the lower line, left justified.
2. Press the ↑ or ↓ buttons to scroll through the list of choices.

Press ↵ to make your selection. The new selection will be stored in the transmitter and will be displayed on the lower line, right justified.

5.3 Two-Button Operation

The ST 700 Standrad transmitter has an optional two-button interface that provides a user interface and operation capability without opening the transmitter. Figure 18 shows the location of the two-button option and the labels for the buttons.

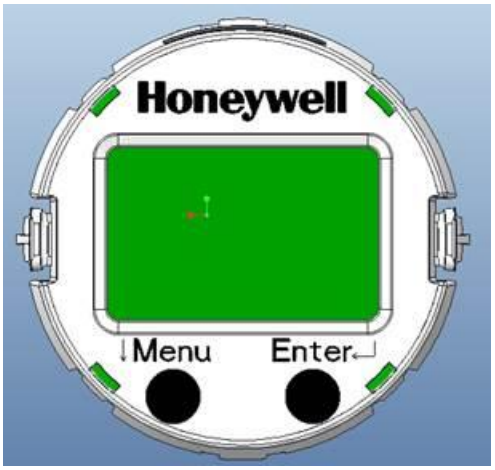

Figure 18 – ST 700 Standard Transmitter - Two-Button Option

5.3.1 The Standard Display Menu

The ST 700 Standard Display Menu is implemented as one long single-level menu and will "wrap around" when it reaches the end of the menu. Operation is as follows:

1. Select <**Exit Menu**> and press ↵ to exit the Menu.
2. Use the ↓ buttons to scroll through the list of menu items.
3. Press the ↵ button to select an item for data entry or activation. When an item is selected for data entry or activation, the cursor will jump to the lower line of the LCD to allow editing of the value. No action is taken against a menu item until the user presses the ↵ button.
4. If you want to abort a data entry operation, simply refrain from pushing any buttons for 10 seconds; the data entry operation will time out and the original value of the selected item will be preserved.
5. If you want to abort a menu operation, simply refrain from pushing any buttons for 60 seconds; the menu operation will time out and the exit from menu & it will show PV value.

Note: The abort option is not available for Loop test parameter.

<Exit Menu>			

5.3.2 Standard Display Abbreviations:

Table 13 – The Standard Display abbreviations

Abbreviation	Meaning
OOR	Out of Range
PRSPAN	Push reduce span
Wrng Mo	Wrong Mode
Illegal	Illegal Value
Wrt Err	NVM write error
Too Hi	Value/Parameter Too High
Too Lo	Value/Parameter Too Low
LRV Hi	LRV too High
LRV Lo	LRV too Low
LargeSP	Span too large
SmallSP	Span too small
Locked	Device is locked
Multidr	Device in multidrop mode
Wrt Prt	Device in write protect mode
NotSprt	Not supported
Hi LMT	Value is greater than high Limit value
Low LMT	Value is less than low Limit value

5.3.3 Data Entry

Data entry is performed from left to right. Select a character / digit by pressing ↓ buttons, and then press ↵ to advance to the next character position to the right. Select the cross-hatch character ▒ to terminate the entry or if the final character is already a space character, just press **<<** again.

All numeric entries are clamped at the low or high limit if needed. You can determine the low and high limit for a parameter by selecting either the **H** or **L** character while the cursor is positioned over the left-most digit and press ↵ button. The Display will show the selected limit.
For numeric entry sign is required to be entered only for negative numbers. For positive number, select space and move ahead.

Table 14 –Two-Button Data Entry

Screen Symbol	Numeric data entry
H	Display the high limit for this parameter. This symbol only appears in the left-most position of the data entry field.
L	Display the low limit for this parameter. This symbol only appears in the left-most position of the data entry field.
<<	Terminate the numeric entry
0 thru 9, Minus, Decimal	These characters are used to enter numeric values. The minus sign only appears in the left-most digit.

5.3.4 Editing a Numeric value

Editing a numeric value is a digit-by-digit process, starting with the left-most digit.

1. Press ↵ to begin the edit process.
2. The Standard Display will show the current value of the item on the lower line, left justified.
3. Press the ↓ buttons to select the desired digit, and then press ↵ to advance to the next digit to the right.
4. After the last digit has been entered, press ↵ one more time to write the new value to the transmitter.

5.3.5 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g. PV Display, Pressure Units, and so forth.).

1. Press ↵ to begin the edit process.
    a. The Standard Display will show the current setting of the item on the lower line
2. Press the ↓ buttons to scroll through the list of choices.
3. Press ↵ to make your selection. The new selection will be stored in the transmitter and will be displayed on the lower line

5.4 Basic and Standard Display Operations

5.4.1 Editing a Numeric value

Editing of a numeric value is a digit-by-digit process, starting with the left-most digit.

1. Press ↵ to begin the edit process:
   - The Basic and Standard Display will display the current value of the item on the lower line, left justified.
   - **Basic Display:** Press the ↑ or ↓ buttons to select the relevant digit, and then press ↵ to advance to the next digit to the right.
   - **Standard Display:** Press the ↓ button to select the relevant digit, and then press ↵ (both button simultaneously) to advance to the next digit on the right.
2. Basic and Simply Displays: After the last digit has been entered, press ↵ one more time to write the new value to the transmitter.

5.4.2 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g. PV Display, Pressure Units, etc.).

1. Press ↵ to begin the edit process.
   a. The Basic Display will show the current setting of the item on the lower line, left justified.
2. Press the ↑ or ↓ buttons to scroll through the list of choices.

   Press ↵ to make your selection. The new selection will be stored in the transmitter and will be displayed on the lower line, right justified.

5.5 Three Button Operation with no Display Installed

When there is no Display installed, the buttons can be used to perform a Zero or Span adjustment of the ST 700 Standard Transmitter. Caution should be taken to insure these adjustments are only made when the correct input pressures are applied.

5.5.1 Zero Adjustment

This adjustment is the same as performing a Set LRV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 16 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the Transmitter LRV.
3. Press the Down (↓) and Zero (↑) buttons together to set the Zero.
4. Verify that the output is now 4 mA.

5.5.2 Span Adjustment

This adjustment is the same as performing a Set URV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 16 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the desired Upper Range Value of the transmitter.
3. Press the **Down (↓)** and **Span (↵**) buttons together to set the span.
4. Verify that the PV output is now 20mA.

You can also use the MCT 202 Toolkit to make any adjustments to an ST 700 SmartLine Pressure Transmitter. Alternately, certain adjustments are possible through an Experion Station or Universal Station, if the ST 700 is digitally integrated with either of these stations.

5.6 Changing the Default Failsafe Direction

Transmitters are shipped with a default failsafe direction of upscale. This means that the Transmitter output will set the current output to upscale failsafe (maximum output) upon detection of a critical status. You can change the direction from upscale failsafe to downscale failsafe (minimum output) by moving the top jumper located in the Electronics module.

5.6.1 DE and Analog Differences

Failsafe operation is different between DE and analog operation:

- **Analog operation** – Upscale failsafe drives the Transmitter output to 21.8mA. Downscale failsafe drives the Transmitter output to 3.8mA.
- **DE operation** – Upscale failsafe causes the Transmitter to generate a **+ infinity** digital signal. Downscale failsafe causes the Transmitter to generate a **– infinity** digital signal.

The Transmitter electronics module interprets either signal as *not-a-number* and initiates its own configured failsafe action for the control system.

5.6.2 Procedure to Establish Failsafe Operation

The failsafe direction display accessible via the Toolkit shows only the state of the jumper as it correlates to analog Transmitter operation. Failsafe action for the DE control system may be configured to operate in a manner different from analog, as indicated by the state of the Transmitter jumper.

The integrated circuits in the Transmitter PWA are vunerable to damage by stray static discharges when removed from the Electronics Housing. Minimize the possibility of static discharge damage when handling the PWA as follows:

Do not touch terminals, connectors, component leads, or circuits when handling the PWA.

When removing or installing the PWA, handle it by its edges or bracket section only. If you need to touch the PWA circuits, be sure you are grounded by staying in contact with a grounded surface or by wearing a grounded wrist strap.

When the PWA is removed from the Transmitter, put it in an electrically conductive bag, or wrap it in aluminum foil to protect it.

The following procedure outlines the steps for positioning the write protect and failsafe jumpers on the electronics module. See Figure 19 for the locations of the failsafe and write protect jumpers.

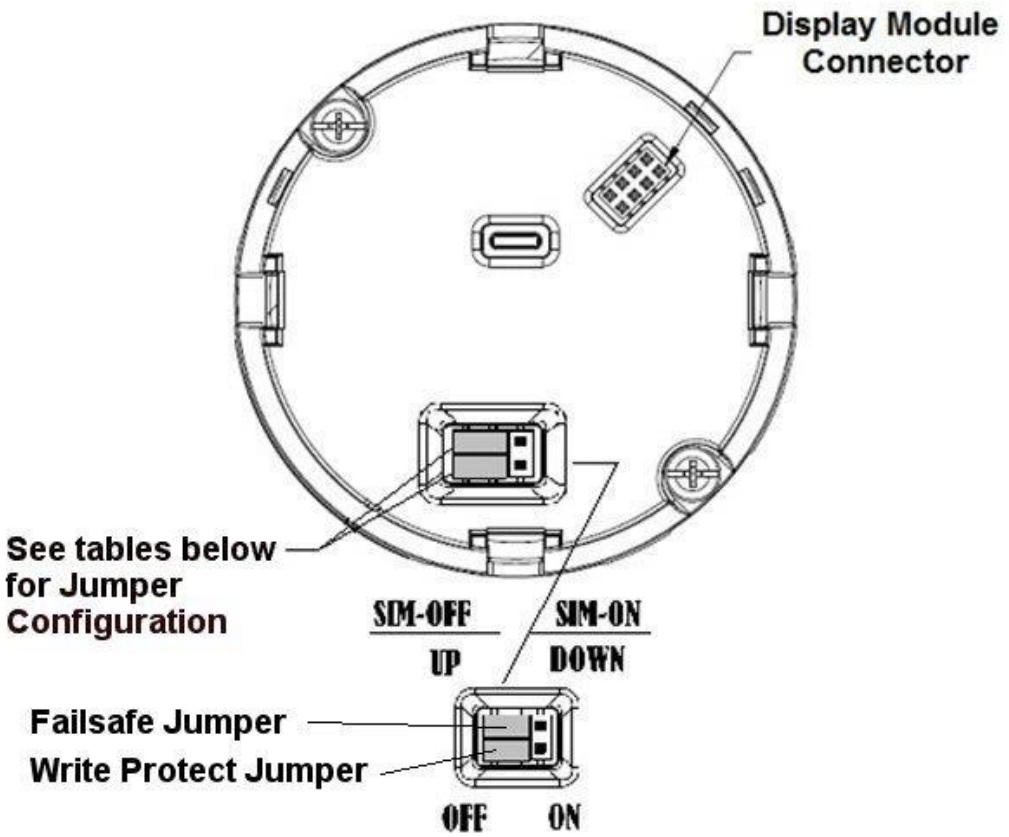

Figure 19 – ST 700 Standard Transmitter - Locating the Failsafe and Write Protect Jumpers

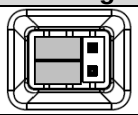
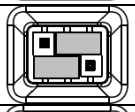
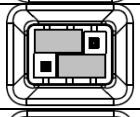
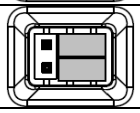
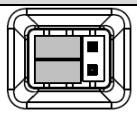
Table 15 – ST 700 Standard Transmitter - Hart and DE Failsafe and Write Protect Jumpers

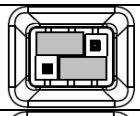


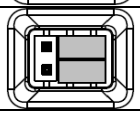












Jumper Arrangements	Description
	Failsafe = UP (High) Write Protect = OFF (Not Protected)
	Failsafe = DOWN (Low) Write Protect = OFF (Not Protected)
	Failsafe = UP (High) Write Protect = ON (Protected)
	Failsafe = Down (Low) Write Protect = On (Protected)

Table 16 – ST 700 Standard Transmitter - Fieldbus Simulation and Write Protect Jumpers

Image	Description
	Fieldbus Simulation Mode = OFF Write Protect = OFF (Not Protected)
	Fieldbus Simulation Mode = OFF Write Protect = ON (Protected)
	Fieldbus SIM Mode = ON Write Protect = OFF (Not Protected)

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosionproof and Class 1 Div 2 environments).

2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.

3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.

4. If necessary, unplug the interface connector from the Communication module. Do not discard the connector.

5. Set the Failsafe Jumper (top jumper) to the desired position (UP or DOWN). See Table 15 and Table 16 for jumper positioning.

6. If applicable, re-install the Display module as follows:

    - Orient the display as desired.
    - Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.
    - Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

    Note: Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.

    Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90° increments.

7. Restore transmitter power if removed.

5.7 Monitoring the Basic and Standard Displays for the ST 700 Standard Transmitter

This section describes the information shown on the operator screens of the Basic and Standard Displays.

5.7.1 Basic Display_ST 700 Standard Transmitter -

Figure 20 illustrates the Basic Display format with Process Variable (PV).

- The PV value is user-configurable. This field has 7 characters. The maximum allowable numeric value is 9999999 or -999999. If fractional decimals are configured, the fractional positions will be dropped, as required. If the PV value exceeds the above limits, it is divided by 1000 and "K" is appended to the result, allowing a maximum value with multiplier of 999999K or -99999K.
- Process Variable Tag is user-configurable from a HART Host. This field has 14 characters.
- Engineering Units, this field is user-configurable. This field has 8 characters.

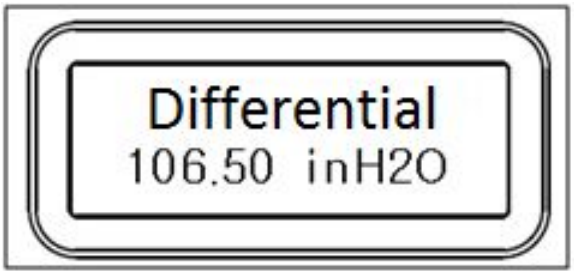


Figure 20 – ST 700 Standard Transmitter - Basic Display with Process Variable Format

5.7.2 Standard Display_ST 700 Standard Transmitter -

- The PV value is user-configurable. This field has 6 characters. The maximum allowable numeric value is 999999 or -999999.
    - If fractional decimals are configured, the fractional positions will be dropped, as required.
    - If the PV value exceeds the above limits, it is divided by 1000 and "K" is appended to the result, allowing a maximum value with multiplier of 99999K or -99999K.

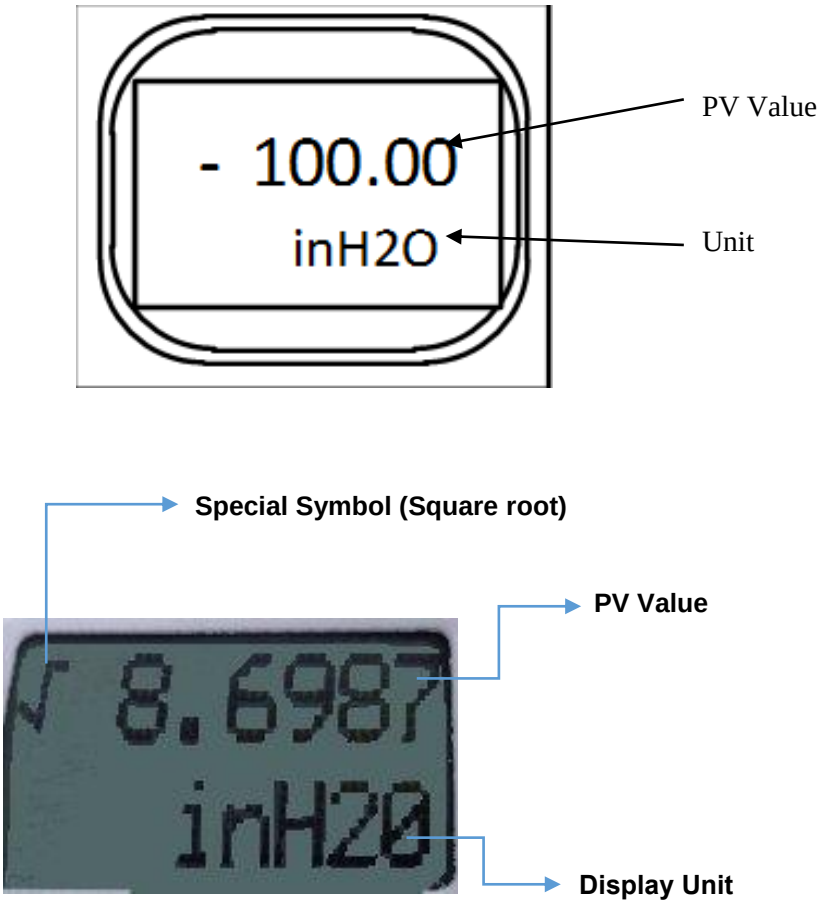

Figure 21 – ST 700 Standard Transmitter - Standard Display with Process Variable Format

6. Maintenance_ST 700 Standard Transmitter

6.1 Overview

This section provides information about preventive maintenance and replacing damaged parts. The topics covered in this section are:

- Preventive maintenance of the meter body barrier diaphragms and process piping to the Transmitter.
- Replacement of damaged parts such as the Transmitter Printed Wiring Assembly (PWA) and meter body

6.2 Preventive Maintenance Practices and Schedules

The ST 700 Transmitter does not require any specific maintenance at regularly scheduled intervals. However, it is recommended that you perform these typical inspection and maintenance routines on a schedule that is dictated by the characteristics of the process medium and if blow-down facilities or purge systems are being used.

- Check piping for leaks.
- Clear piping of sediment or other foreign matter.
- Clean the Transmitter process heads, including the barrier diaphragms.

6.3 Inspecting and Cleaning Barrier Diaphragms

Depending on the characteristics of the process medium, sediment or other foreign particles may collect in the process head cavity/chamber and cause faulty measurement. In addition, the barrier diaphragm(s) in the Transmitter meter body may become coated with residue from the process medium. The latter is also true for external diaphragms on flange-mount and remote seal type Transmitters.

In many cases, you can readily remove the process head(s) from the Transmitter meter body to clean the process head cavity and inspect the barrier diaphragm(s). For flange-mount and remote seal diaphragms, you may only need to run a purge line in the tank to rinse off the face of the diaphragm(s).

The following procedure comprises the general steps for inspecting and cleaning barrier diaphragms. You may have to modify these steps to meet your particular process or transmitter model requirements. Figure 22 shows an exploded view of a Differential Pressure (DP) Transmitter meter body for reference. For disassembly/reassembly purposes, Gauge Pressure (GP) and Absolute Pressure (AP) Transmitters are similar.

It is recommended that you remove the Transmitter from service and move it to a clean area before disassembling it.

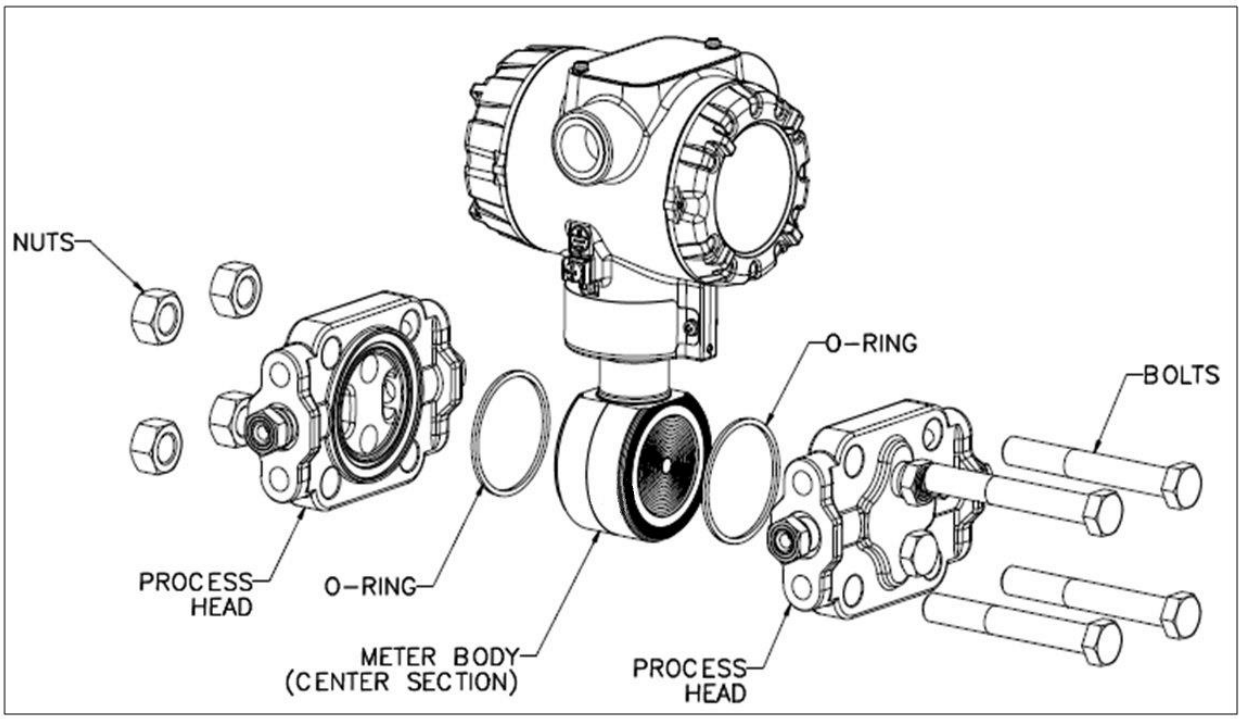

Figure 22 – ST 700 Standard Transmitter - DP Transmitter Head Disassembly

1. Close all valves to isolate the Transmitter from the process.
2. Open the vent in the process head to drain fluid from the Transmitter meter body, as necessary.
3. Remove the Transmitter from the process.
4. Loosen the nuts in the sequence shown in Figure 23.
5. Remove the nuts from the bolts that hold the process head(s) to the meter body.
6. Remove the process heads and bolts.
7. Remove the gasket/ O-ring, and clean the interior of the process head using a soft bristle brush and an approved solvent.
8. Inspect the barrier diaphragm for signs of deterioration, corrosion, and distortion.
9. If the diaphragm is distorted contact Honeywell for assistance.
10. Install a new gasket/O-ring in each process head.
11. Coat threads on the process head bolts with a suitable anti-seize compound, such as "Neverseize," or equivalent.
12. Using a torque wrench, gradually tighten the nuts in the sequence shown in Figure 23. Tighten head bolts in stages of 1/3-full torque, 2/3-full torque, and full torque. Refer to the values in Table 17 for torque requirements versus Transmitter type and model.

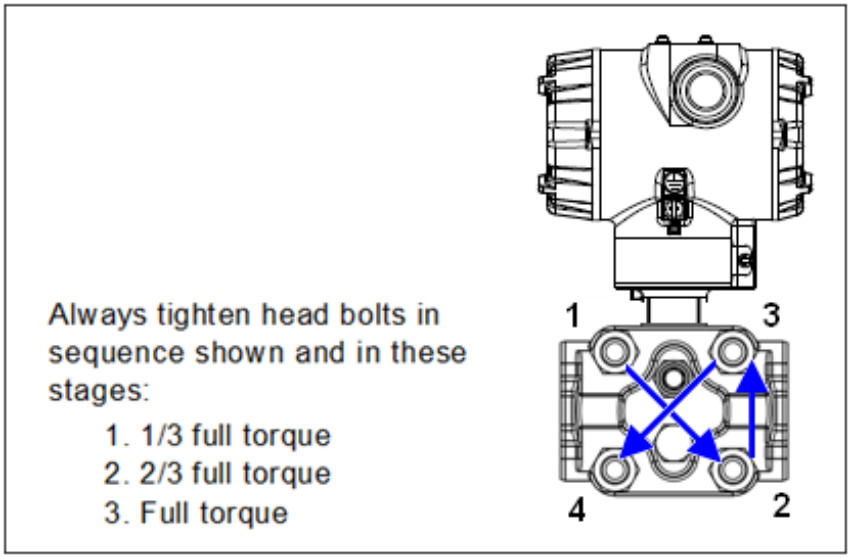

Figure 23 – ST 700 Standard Transmitter - Head Bolt Tightening Sequence

6.4 Replacing the Communication Module

The Communication module includes a connector to the sensor ribbon cable and a connector to the optional Display module. This section includes the procedure to replace the Communication module.

The transmitter does not have to be removed from service to replace the Comm Module

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

Refer to Figure 24 for parts locations.

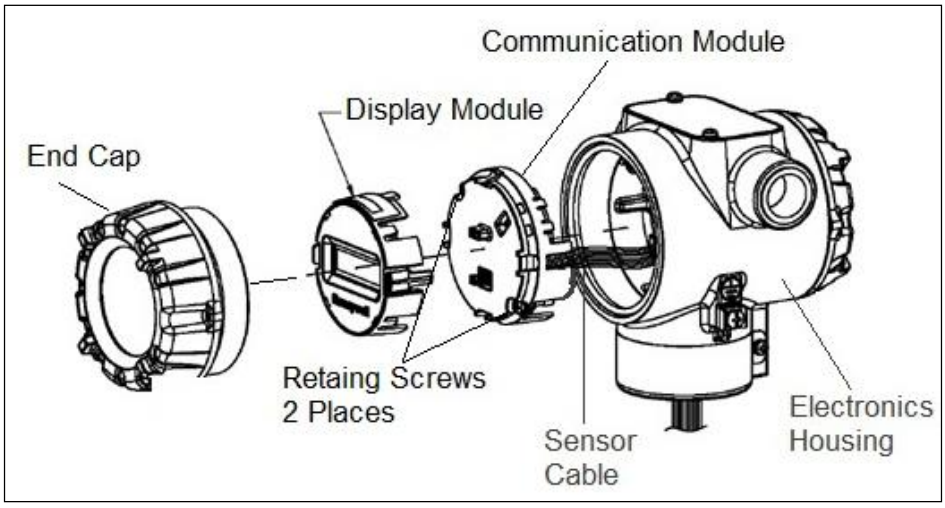

Figure 24 – ST 700 Standard Transmitter - PWA Replacement

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosion-proof and Class 1 Div 2 environments).
    - When removing the Communications Module with power applied, the loop will go to 0V. Likewise, installing a Communications Module into a transmitter with power applied will cause the loop output value to go to 12ma for several seconds then the loop output value will go to the configured value based on the PV input.
    - Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.
2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.
3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.
4. If necessary, unplug the interface connector from the Communication module. **Do not discard the connector**.
5. Loosen the two retaining screws, and carefully pull the Communication module from the Electronics compartment.

6. Carefully align and connect the Sensor Ribbon Cable to the connector "J4" at the bottom of the Communication module. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.

7. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.

8. Tighten the two Communication module retaining screws.

9. Refer to the SmartLine User's Manual to change the FAILSAFE, READ/WRITE, and SIM-OFF/SIM-ON (Fieldbus Only) configuration settings.

10. If applicable, re-install the Display module as follows:

    a. Orient the display as desired.

    b. Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.

    c. Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90 º increments.

11. Apply Parker Super O-ring Lubricant or equivalent to the end cap O-ring before installing the end cap. Reinstall the End Cap and tighten the End Cap locking screw.

12. Installing Optional External Configuration Button Assembly.

    a. Loosen (Do Not Remove) both top nameplate screws and pivot nameplate 90°.

    b. Align the protrusion on the button assembly with the matching opening in the housing and snap the button assembly into the housing.

    c. Rotate the nameplate back to the original position, and tighten the nameplate screws.

(Steps 13 - 16 required for Field Upgrades Only)

13. Loosen the End Cap locking screw and unscrew the End Cap from the Field Wiring side of the transmitter housing.

14. Select the proper Communication/External Configuration upgrade kit label from the label strip provided and adhere to the inside of the Field Wiring compartment End Cap.

15. Apply Parker Super O-ring Lubricant or equivalent to the end cap o-ring before installing the end cap. Reinstall the End Cap and tighten the end cap locking screw.

16. Install external upgrade label (e.g. DEVICE MODIFIED…..) provided on outside of housing as shown in Figure 24.

17. Restore power if removed.

18. Check the settings of the Transmitter Setup and Display Setup parameters to make sure that the transmitter is configured correctly for your application. See the HART/DE User's Manual (ST 800 #34-ST-25-38, ST 700 #34-ST-25-44) for details on HART and DE transmitters. Refer to manual #34-ST-25-39 for additional information about Fieldbus transmitters.

19. If applicable, verify External Button Configuration operation. The transmitter is now available for use.

6.5 Replacing the Meter Body

You can replace the complete meter body, including the process heads, or the meter body only on certain Differential Pressure (DP), Gauge Pressure (GP), and Atmospheric Pressure (AP) Transmitters by using the existing process head(s). Use the following procedure for meter body-only replacement.

1. Save or record device configuration data.
2. Turn off Transmitter power.
3. Remove the Transmitter from service, and move it to a clean area before disassembling it.
4. Refer to Figure 25. Loosen the End Cap Lock, and unscrew the End Cap from the electronics side of the Transmitter housing.

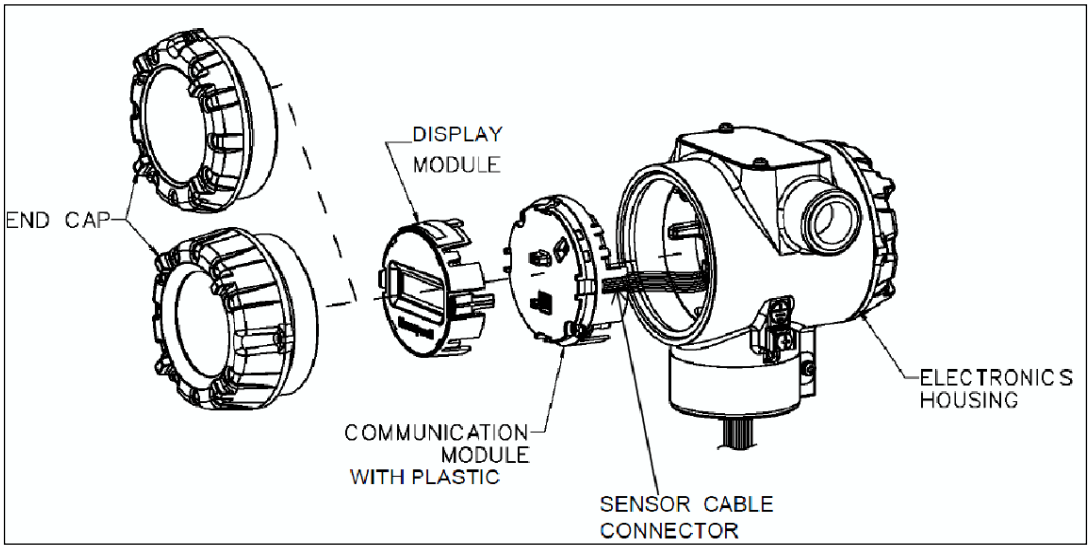

Figure 25 – ST 700 Standard Transmitter - Disassembly for Meter Body Replacement

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

5. If a display is present, press the two snaps along the side, and remove it from the communication module assembly.
   Note: Do not discard or misplace the Display/Communication connector, it will be required to reassemble the Display Module
6. Loosen the two retaining screws, and remove the Communications Module assembly, and remove the Communication Module assembly from the electronics housing.

7. Disconnect the Sensor Cable from the Communications Board.
8. Refer to Figure 26. Use a 2mm hex wrench to completely loosen the set screw on the outside of the housing to permit rotating the meter body.

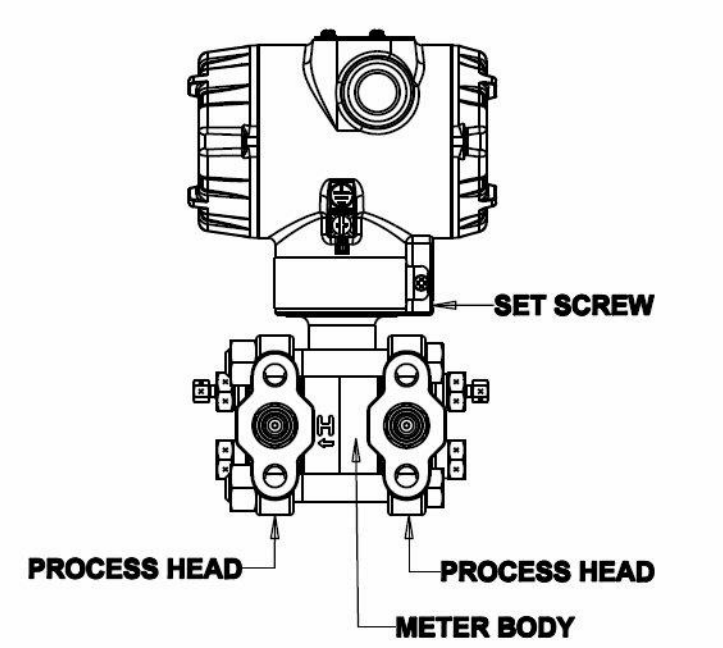

Figure 26 – ST 700 Standard Transmitter - Hardware Location to Remove the Meter Assembly

9. Carefully turn the complete meter body counterclockwise to unscrew it from the electronics housing.
10. Remove the nuts from bolts that hold the process head(s) to the Meter Body.
11. Remove process heads and bolts.
12. Remove the gaskets or O-rings from the process heads.
13. Clean the interior of the process head(s) with a soft bristle brush and suitable solvent.

CAUTION: To prevent damage to the diaphragm in the Meter Body, use extreme care when handling or placing the Meter Body on any surface. Carefully assemble gaskets or O-rings to the meter body. If installing O-rings, lubricate with water or leave dry.

14. Coat threads on process head bolts with anti-seize compound such as “Neverseize” or equivalent.
15. Refer to Figure 27. Apply Dow Corning #33 silicone grease to the meter body adapter O-ring and carefully assemble the O-ring to the meter body. Assemble the process head(s) and bolts to the new meter body. For now, make the bolts only finger-tight.

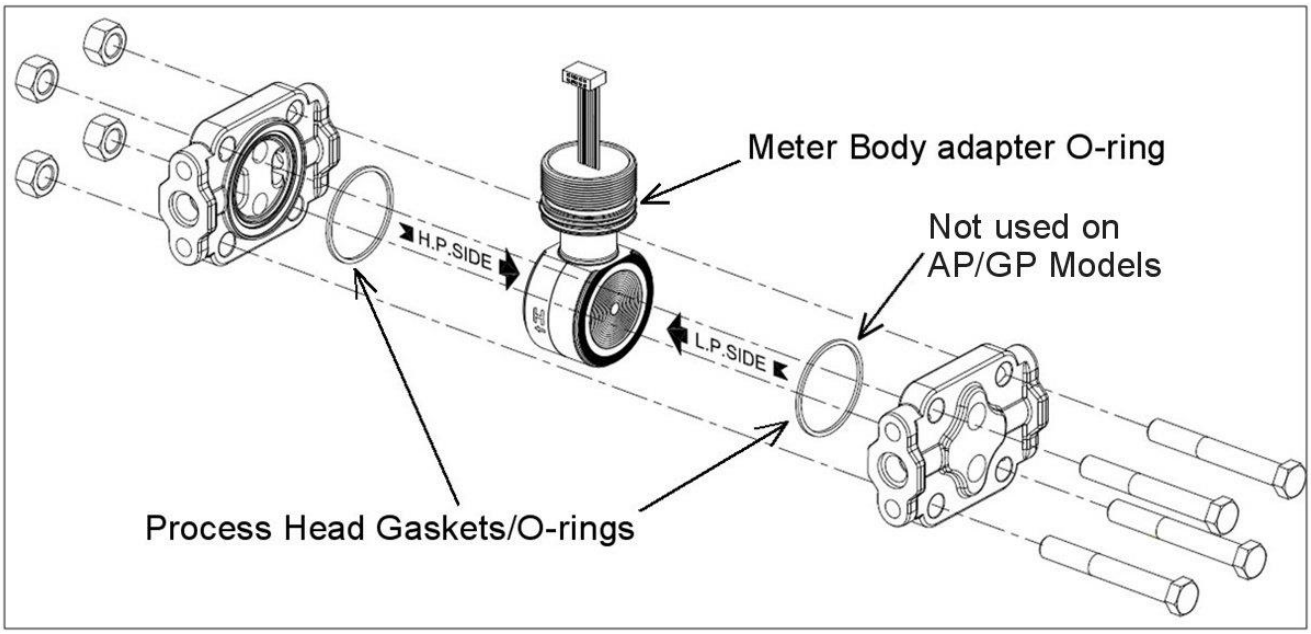

Figure 27 – ST 700 Standard Transmitter - Meter Body Reassembly

16. Use a torque wrench to gradually tighten nuts to torque rating in sequence shown in Figure 28. Tighten head bolts in stages of 1/3 full torque, 2/3 full torque, and then full torque.

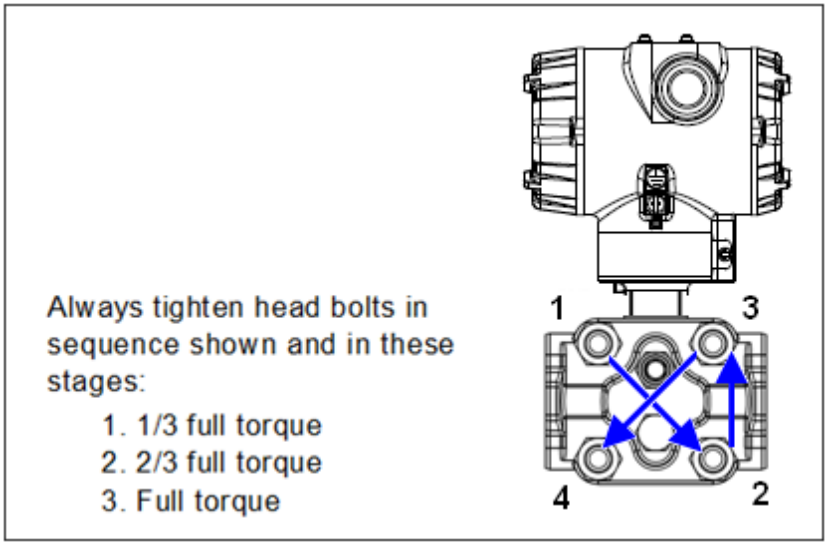

Figure 28 – ST 700 Standard Transmitter - Head Bolt Tightening Sequence

17. Feed the ribbon cable on the new meter body through the neck of the housing.

CAUTION: To prevent damage to the ribbon cable, use care when assembling the Meter Body to the electronics housing.

18. Screw the new meter body into the housing until the bottom of the Meter Body adapter is flush with the neck of the electronics housing.
19. Tighten the outside set screw to be sure it is fully seated in the slot in the header.

20. Loosen the set screw ½- turn.
21. Rotate the housing to the desired position (Max. 180^{o} in either direction), and tighten the set screw.
22. Carefully align and connect the Sensor Ribbon Cable to connector "J4" at the bottom of the Communication module board. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.
23. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.
24. Tighten the two Communication module retaining screws.
25. If applicable, re-install the Display module as follows:
    a. Orient the display as desired.
    b. Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.
    c. Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window.
You can rotate the meter mounting orientation in 90 o increments.

26. Connect the bracket to the Transmitter housing.
27. Recalibrate the Transmitter per section 7 Calibration, of this document.
28. Return the Transmitter to service, and turn ON power
29. Verify the Transmitter configuration data. Restore the saved database if necessary.
30. Lubricate the end-cap O-ring with Parker Super O-ring silicone lubricant or equivalent before replacing the end caps.

7. Calibration for the ST 700 Standard Transmitter

7.1 Recommendations for Transmitter Calibration

The ST 700 Standard Transmitter does not require periodic calibration to maintain accuracy. Typically, calibration of a process-connected Transmitter will degrade, rather than augment the capability of a smart Transmitter. For this reason, it is recommended that a Transmitter be removed from service before calibration. Moreover, calibration will be accomplished in a controlled, laboratory-type environment, using certified precision equipment.

7.2 Calibration Procedures

For a Transmitter operating in analog mode, you must calibrate its output signal measurement range using any compatible hand-held communicator or a local display.

One calibration option is to use the Honeywell Smart Field Communicator (SFC). Refer to the *Smart Field Communicator Operating Guide,* Document # 34-ST-11-14 for calibration procedures.

Calibration information and procedures for a Transmitter operating in the HART/DE mode are provided in the *ST 700 Series HART/DE Option User's Manual*, Document # 34-25-25-47.

8. Troubleshooting on the ST 700 Standard Transmitter

8.1 Overview

Troubleshooting involves responding to error messages, primarily displayed by the MC Toolkit. Error messages that may occur on the Transmitter's local display are fairly self-explanatory and intuitive. However, this section covers the diagnostic messages that indicate critical conditions. Other than the critical conditions, additional detail is not provided. If you require assistance, contact your distributor or Honeywell Technical Support. All other messages are covered by the MC Toolkit Users' Manual.

8.2 Critical Diagnostics Screens

The Basic Display will display the message CRITCAL FAULT on the top line of the LCD and the appropriate diagnostic text on the lower line.

A description of the diagnostic conditions is given in Table 18 and Table 19 along with suggested actions for resolving the problem.

8.2.1 Fault Conditions and Recommended Corrective Actions – Basic Display

Table 18 – ST 700 Standard Transmitter - Fault Conditions and Recommended Corrective Actions.

Condtion	Analysis	Recommended Corrective Action
Fault. A critical failure has been detected in the Meter body	Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual to get more information about the possible causes of the failure.	Cycle power to the Transmitter. If the problem continues to occur, replace the Meter body.
Electronics Module Fault. A critical failure has been detected on the HART, DE, or FF Electronics Module.	Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual for more information about the possible failure causes.	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.
Meter body Comm fault. Communications between the Meter body and the Electronics Module has failed.	This could be the result of a failure on either of these modules or the cable that connects them. Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual to get more information about the possible causes of the failure.	Check the ribbon cable that connects the Meter body to the Electronics Module. Make sure that the cable is securely plugged into the Electronics Module. Make sure that all pins are plugged into the connector (e.g., make sure that the connector is not offset in a way that leaves some pins unconnected). Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module. If

Condtion	Analysis	Recommended Corrective Action
		this does not fix the problem, replace the Meter body.

8.2.2 Fault Conditions and Recommended Corrective Actions – Standard Display

The Standard Display will display the message FAULT on the top line of the LCD and the appropriate diagnostic text on the lower line.

Table 19 – ST 700 Standard Transmitter - Fault Conditions and Recommended Corrective Actions.

Condtion	Analysis	Recommended Corrective Action
Mbd Com (Meter body Comm fault)	Communications between the Meter body and the Electronics Module has failed.	Check the ribbon cable that connects the Meter body to the Electronics Module. Ensure that the cable is securely plugged into the Electronics Module. Ensure that all pins are plugged into the connector (e.g. ensure that the connector is not offset in a way that leaves some pins unconnected). Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module. If this does not fix the problem, replace the Meter body.
Comm El (Communication Board fault)	A critical failure has been detected on the HART Electronics Module.	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.
Mtrbody (Sensor Board Fault)	A critical failure has been detected in the Meter body	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.

9. Parts List_ST 700 Standard Transmitter

9.1 Overview

Individually saleable parts for the various Transmitter models are listed in this section. Some parts are illustrated for identification. Parts are identified and listed in the corresponding tables as follows:

- Individually saleable parts are indicated in each figure by key number callout.
- Parts that are supplied in kits are indicated in each illustration by key number callout with the letter K prefix.

Table 20 is a list of recommended spare parts.

Refer to Appendix A for Product Certifications and Approvals for the ST 700 Standard and Basic Transmitter.

10. Introduction_ST 700 Basic Transmitter

10.1 Overview

This section is an introduction to the physical and functional characteristics Honeywell's family of the ST 700 Basic SmartLine Pressure Transmitters.

If you are not sure which type of ST 700 you have, Standrad or Basic, please refer to Section 1 of this manual

If you have a ST 700 Standard Transmitter use Sections **2** through **9**.
If you have a ST 700 Basic Transmitter go straight to Section **10** through **17.**

10.2 Features and Options

The ST 700 Basic transmitter is available in a variety of models for measuring Differential Pressure (DP), Gauge Pressure (GP), and Absolute Pressure (AP). Table 28 lists the protocols, human interface (HMI), materials, approvals, and mounting bracket options for the ST 700.

Table 28 – ST 700 Basic Transmitter - Features and Options

Feature/Option	Basic/Available Options
Communication Protocols	HART® version 7
Human-Machine Interface (HMI) Options (Standard Display/External Two buttons)	
	Standard Display (HART® only): • Two-button programming (optional) • Standard display language: English only • Two-mode operations: PV display and Menu Navigation
Calibration	Single
Approvals See section 0 for details.	FM, CSA, ATEX, IECEx, SAEx, INMETRO, NEPSI, GOST
Mounting Brackets	Angle/flat carbon steel/304 and 316 stainless steel,
Integration Tools	Experion

	The 2-button option is available for the Standard Display. The External 2-buttons option is available in this model.This is used for navigation of standard display or for setting zero, span and zero correct where standard display is not connected.

10.2.1 Physical Characteristics

As shown in Figure 41 the ST 700 Basic transmitter is packaged in two major assemblies: the Electronics Housing and the Meter Body. The elements in the Electronic Housing respond to setup commands and execute the software and protocol for the different pressure measurement types. Figure 42 shows the assemblies in the Electronics Housing with available options.

The Meter Body provides connection to a process system. Several physical interface configurations are available, as determined by the mounting and mechanical connections, all of which are described in the **Installation** section of this manual.

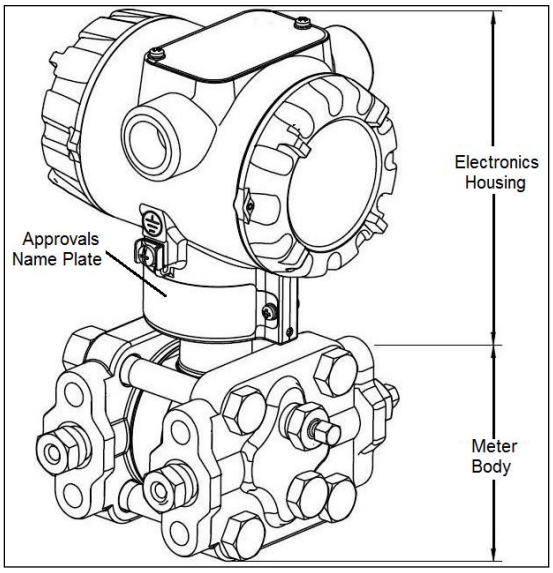

Figure 41 – ST 700 Basic Transmitter - Major Assemblies

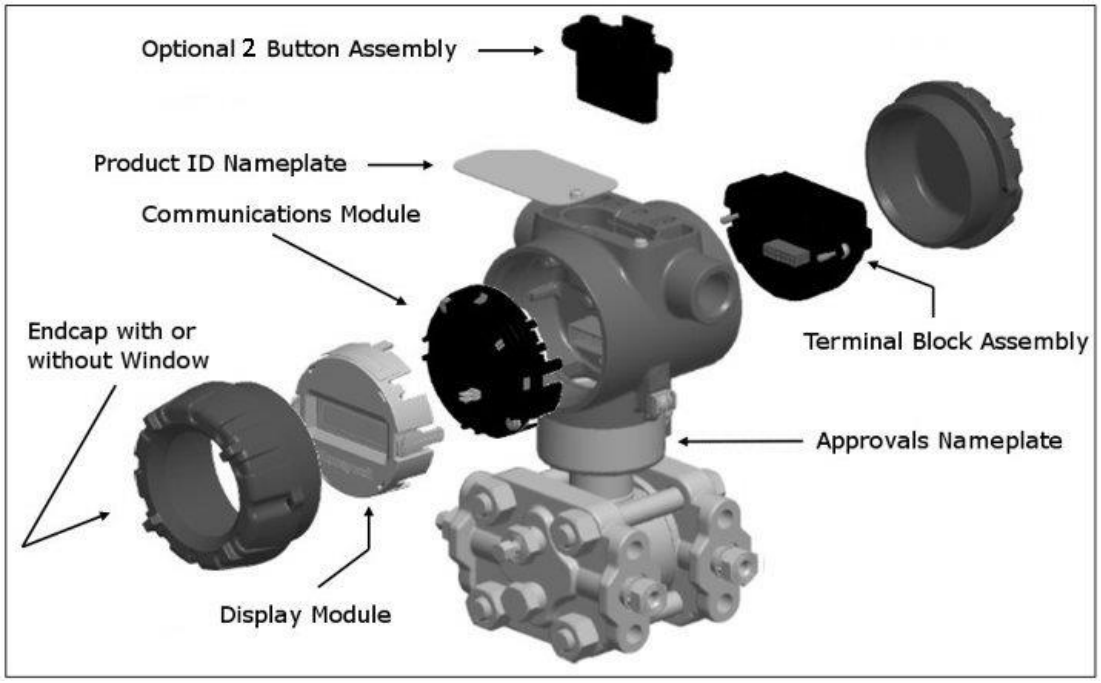

Figure 42 – ST 700 Basic transmitter Electronics Housing Components

10.2.2 Functional Characteristics

The Transmitter measures process pressure and provides a proportional analog 4 to 20mA output to the measured process variable (PV). Available output communication protocols include HART®.

The Standard display is only available on HART transmitters.

An optional external 2-button assembly is available to set up and make adjustments to the Transmitter. In addition, a Honeywell Multi-Communication (MC) Toolkit (not supplied with the Transmitter) can facilitate setup and adjustment procedures. Certain adjustments can be made through an Experion Station if the Transmitter is digitally integrated with Honeywell's Experion.

The Standard Display Menu is implemented as one long single-level menu and will "wrap around" when it reaches the start or end of the menu. The Standard Display uses an optional 2-button assembly to set up and make adjustments to the Transmitter.

10.3 ST 700 Transmitter Nameplate

The Transmitter nameplate mounted on the bottom of the electronics housing (see Figure 42) lists its model number, physical configuration, electronics options, accessories, certifications, and manufacturing specialties. Figure 43 is an example of a typical Gauge Pressure (GP) or Atmospheric Pressure (AP) Transmitter name plate. The model number format consists of a Key Number with several table selections. The Differential Pressure (DP), Absolute Pressure (AP), and Gauge Pressure (GP) name plates are essentially the same. The DP model provides one additional entry (7 vs. 6) in the Meter Body Selections (Table I) to accommodate the static pressure rating.

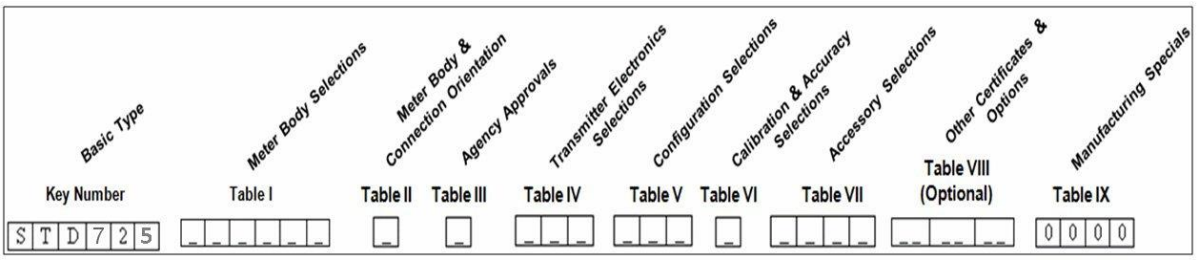

Figure 43 – ST 700 Basic Transmitter - Name Plate

You can readily identify the series and basic Transmitter type from the third and fourth digits in the key number. The letter in the third digit represents one of these basic transmitter types:

- A = Absolute Pressure
- D = Differential Pressure
- F = Flange Mounted
- G = Gauge Pressure
- R = Remote Seals

For a complete selection breakdown, refer to the appropriate Specification and Model Selection Guide provided as a separate document.

10.4 Safety Certification Information

An "approvals" name plate is located on the bottom of the Electronics Assembly; see Figure 42 exact location. The approvals name plate contains information and service marks that disclose the Transmitter compliance information.
See section 0 of this document for safety certification requirements and details.

10.5 Transmitter Adjustments

Zero and Span adjustments are possible in ST 700 Basic Transmitter with the optional external 2-button and integrated two-button assemblies. See Figure 42 for the external 2-button assembly.

You can also use the Honeywell MC Toolkit or other third-party hand-held configurator to make adjustments to the ST 700 Basic Transmitter. Alternately, certain adjustments can be made through the Experion or Universal Station, if the Transmitter is digitally integrated with a Honeywell Experion or TPS system.

10.6 Display Options –Standard Display

Table 29 – ST 700 Basic Transmitter - Available Display Characteristics

Standard Display	• 360° rotation in 90° Increments • 2 lines, 8 characters • Standard units of measurement: Pa, KPa, MPa, KGcm2, TORR, ATM, inH2O, mH2O, bar, mbar, inHg, FTH2O, mmH2O, MMHG, Flow Units (DP models only) ,PSI , cmH2O and mH2O • Diagnostic messaging

10.7 Optional Integrated two-Button Assembly (Standard Display)

The Standard Display does not support all the transmitter configuration parameters and has limited features. The optional Integrated Two-Button Assembly for the Standard Display provides the following features and capabilities:

- Menu and enter key functionality.
- With the menu-driven display:
  - Comprehensive on-screen menu for navigation.
  - Transmitter configuration: enter LRV, enter URV and Loop Test.
  - Transmitter calibration
  - Display configuration (contrast only)
  - Set zero and span parameters.

	If you are using the optional external 2-button assembly with the Standard Display then you can perform all the above operations without removing external glass cap using the external buttons

	**Lower range value (LRV):** A display parameter (Standard display), which allows users to enter the measuring value for which the analog output will be scaled to 4mA. **Upper range value (URV):** A display parameter (Standard display), which allows users to enter the measuring value for which the analog output will be scaled to 20mA.

11. Application Design_ST 700 Basic Transmitter

11.1 Overview

This section discusses the considerations involved with deploying a Honeywell ST 700 Basic Transmitter in a process system. The following areas are covered:

- Safety
- Input and output data
- Reliability
- Environmental limits
- Installation considerations
- Operation and maintenance
- Repair and replacement

11.2 Accuracy

The ST 700 Basic Transmitter measures the gauge, differential, or absolute pressure of a process and reports the measurement to a receiving device.

11.2.1 Diagnostic Messages

Transmitter standard diagnostics are reported in the two basic categories listed in Table 4. Problems detected as critical diagnostics drive the analog output to the programmed burnout level. Problems detected as non-critical diagnostics may affect performance without driving the analog output to the programmed burnout level. Informational messages (not listed in Table 4 report various Transmitter status or setting conditions.

	**The Standard Display is only available on HART transmitters**

	**The Standard Display only displays critical diagnostics (Meter Body Fault, Electronics Module Fault and Meter Body Communication Fault). Non-critical diagnostics are not displayed.**

11.3 Safety

11.3.1 Safety Integrity Level (SIL)

The ST 700 Basic Transmitter has met manufacturer design process requirements of Safety Integrity Level (SIL) 3. These are intended to achieve sufficient integrity against systematic errors of design by the manufacturer.

A Safety Instrumented Function (SIF) designed with this product must not be used at a SIL level higher than the statement, without "prior use" justification by the end user or diverse technology redundancy in the design.

Refer to the *Honeywell SmartLine Safety Manual*, Document # 34-ST-25-37, for additional information.

12. Installation and Startup_ST 700 Basic Transmitter

12.1 Installation Site Evaluation

Evaluate the site selected for the ST 700 Basic Transmitter installation with respect to the process system design specifications and Honeywell's published performance characteristics for your particular model. Some parameters that you may want to include in your site evaluation are:

- Environmental Conditions:
  - Ambient Temperature
  - Relative Humidity
- Potential Noise Sources:
  - Radio Frequency Interference (RFI)
  - Electromagnetic Interference (EMI)
- Vibration Sources
  - Pumps
  - Motorized System Devices (e.g., pumps)
  - Valve Cavitation
- Process Parameters
  - Temperature
  - Maximum Pressure Rating

12.2 Honeywell MC Toolkit

In preparation for post-installation processes, refer to the *MC Tookit User Manual*, Document # 34-ST-25-20, for battery conditioning and device operation and maintenance information.

12.3 Display Installation Precautions

Temperature extremes can affect display quality. The display can become unreadable at temperature extremes; however, this is only a temporary condition. The display will again be readable when temperatures return to within operable limits.

The display update rate may become slower at cold temperature extremes, but as with readability, normal updating resumes when temperatures are within limits for full operability.

	The Transmitter should not be operated without the endcap covers on. Covers can be removed temporarily for configuration with buttons or during maintenance/wiring. The static voltage must be discharged before removing the cover.

12.4 Mounting_ST 700 Basic Transmitter

12.4.1 Summary

ST 700 Basic Transmitter models, except flush mounts and those with integral flanges, can be attached to a two-inch (50 millimeters) vertical or horizontal pipe using Honeywell's optional angle or flat mounting bracket; alternately you can use your own bracket. Flush-mount models are attached directly to a process pipe or tank by a one-inch weld nipple. Models with integral flanges are supported by the flange connection.

Figure 44 shows a typical bracket-mounted and flange-mounted transmitter installations.

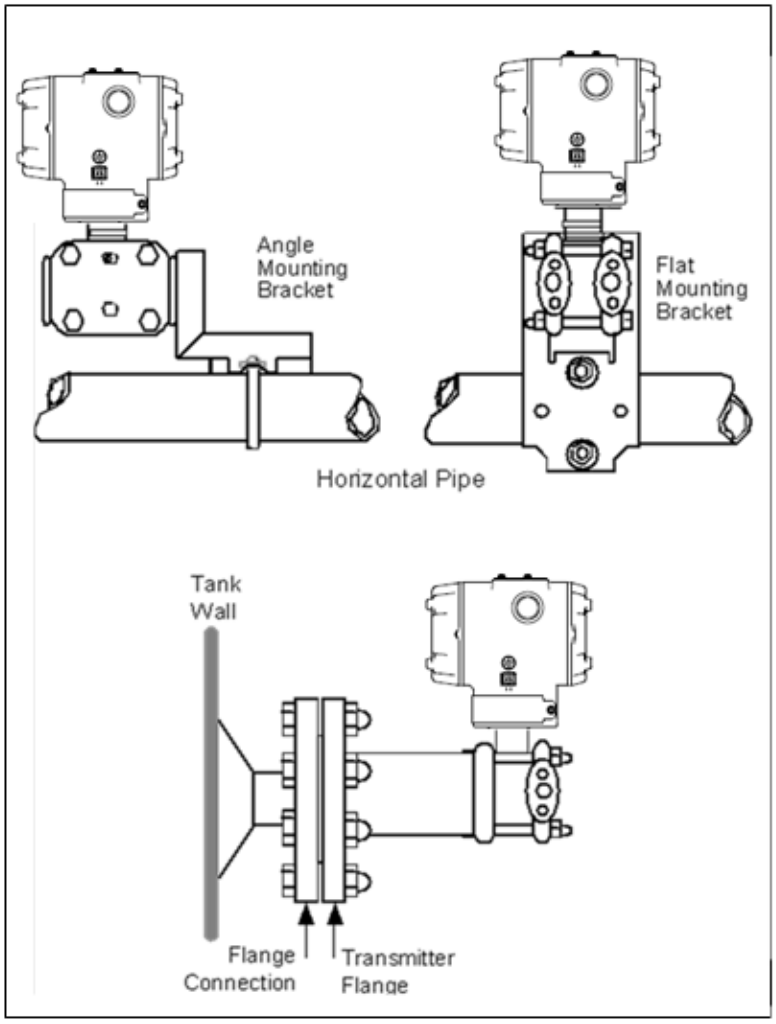

Figure 44 – ST 700 Basic Transmitter - Typical Bracket Mounted and Flange Mounted Installations

12.5 Flush mounting_ST 700 Basic Transmitter

To mount a flush mounted model, cut a hole for a 1" standard pipe in the tank or pipe where the transmitter is to be mounted. Weld the 1" mounting sleeve to the wall of the tank or to the hole cut on the pipe. Insert the meter body of the transmitter into the mounting sleeve and secure with the locking bolt. Tighten the bolt to a torque of 6,4 Nm +/- 0,30 Nm (4.7 ft-lbs +/- 0.2 ft.-lbs.). Figure 45 shows a typical installation for a transmitter with a flush mount on a pipe.

Once the transmitter is mounted, the electronics housing can be rotated to the desired position. See Figure 48 for details.

ATTENTION: On insulated tanks, remove enough insulation to accommodate the mounting sleeve.

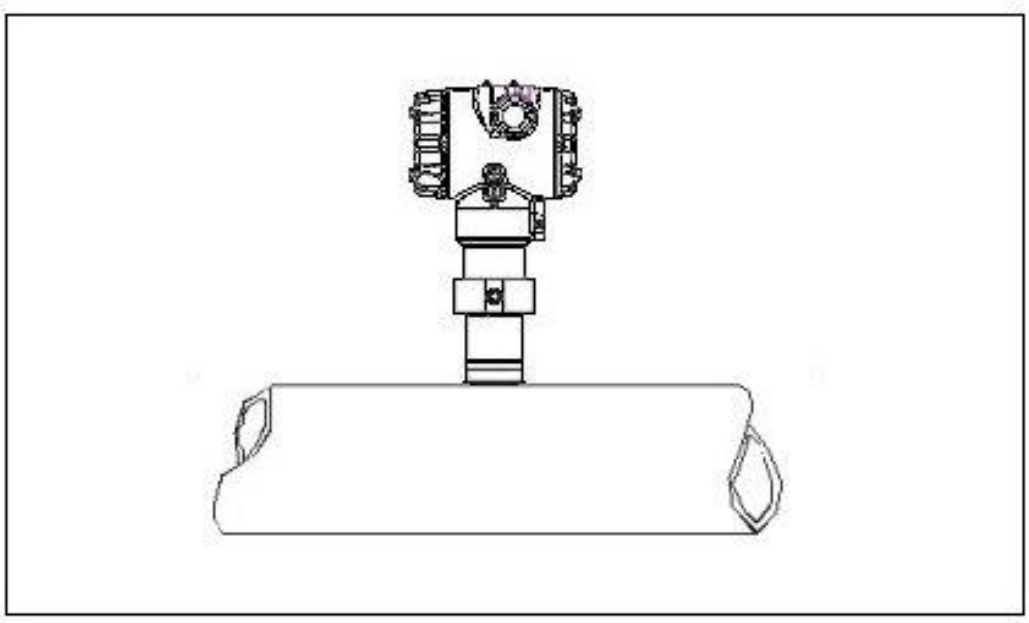

Figure 45 - ST 700 Basic Transmitter - Typical Flush Mounted Transmitter Installation

12.5.1 Mounting Dimensions, ST 700 Basic Transmitter

Refer to Honeywell drawing number 50049930 (Dual Head), 50049931 (In-Line), 50049932 (Flange Mount) 50049933 (Extended Flange), 50049934 (Remote Seal) and 50049936 (Flush Mount Pressure Transmitter) for detailed dimensions. Abbreviated overall dimensions are also shown on the Specification Sheets for the transmitter models. This section assumes that the mounting dimensions have already been taken into account and the mounting area can accommodate the Transmitter.

12.5.2 Bracket Mounting Procedure for ST 700 Basic Transmitter,

If you are using an optional bracket, start with Step 1. For an existing bracket, start with Step 2.

5. Refer to Figure 46 for position of the bracket on a 2-inch (50.8mm) nominal, 2.38-inch (60.4mm) actual, horizontal or vertical pipe, and install a "U" bolt around the pipe and through the holes in the bracket. Secure the bracket with the nuts and lock washers provided.

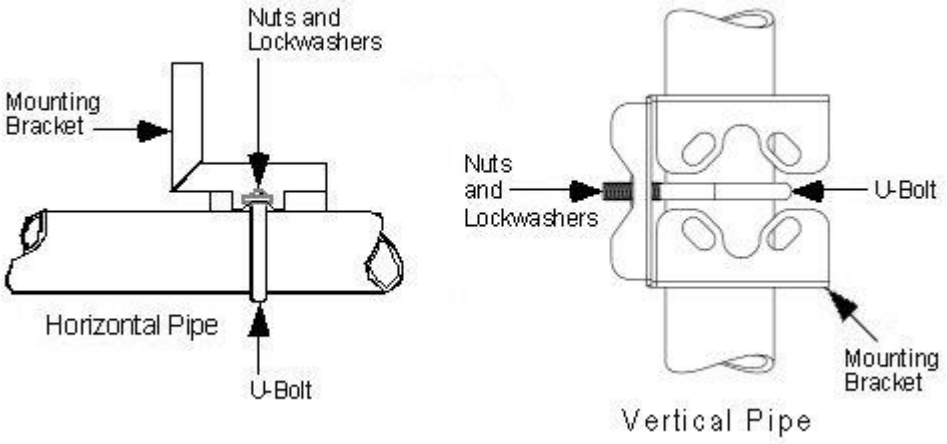

Figure 46 – ST 700 Basic Transmitter - Angle Mounting Bracket Secured to a Horizontal or Vertical Pipe

6. Align the appropriate mounting holes in the Transmitter with the holes in the bracket. Use the bolts and washers provided to secure the Transmitter to the bracket; see the following variations.

Table 30 - ST 700 Basic Transmitter - Mounting Bracket procedure

Transmitter Type	Use Hardware
DP with double-ended process heads and/or remote seals	Alternate mounting holes in the ends of the heads
In-line GP and AP models (STG7xS and STA7xS)	The smaller "U" bolt provided to attach the meter body to the bracket. See the following example.
Dual-head GP and AP	Mounting holes in the end of the process head.

Example: Inline model mounted to an optional angle bracket. See Figure 47.

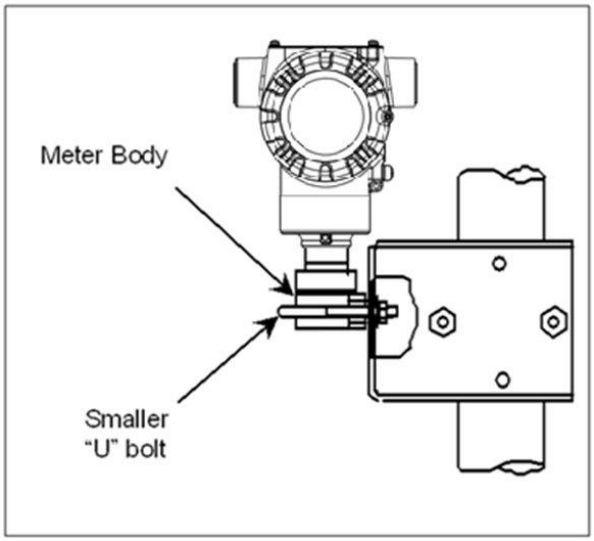

Figure 47 – ST 700 Basic Transmitter - Inline Model Mounted to an Optional Bracket

7. Loosen the set screw on the outside neck of the Transmitter one (1) full turn.

8. Rotate the Electronics housing a maximum of 180º left or right from the center to the position you require, and tighten the set screw using a 4mm metric socket head wrench. See the following example and Figure 48.

   Example: Rotating the Electronics Housing

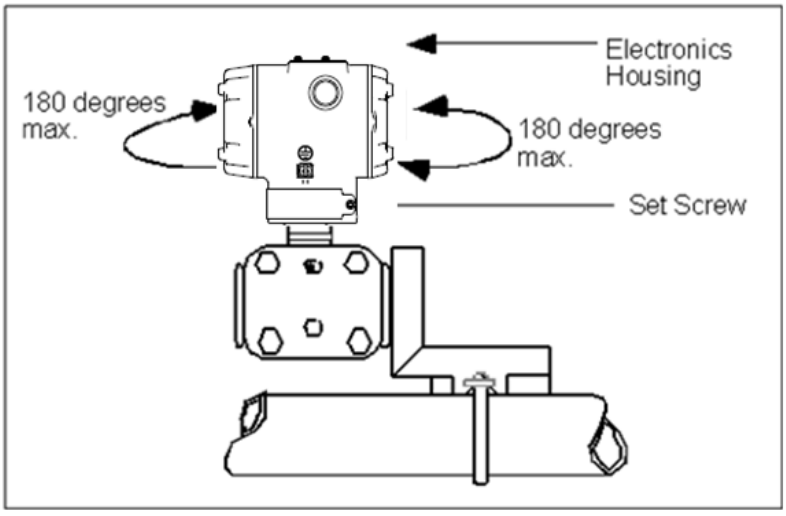

Figure 48 – ST 700 Basic Transmitter - Rotating the Electronics Housing

The mounting position of AP models STA725, STA745, STA72S, STA74S and STA77S becomes critical as the Transmitter spans become smaller. A maximum zero shift of 2.5mmHg for these models can result from a mounting position that is rotated 90o from the vertical.
A typical zero-shift of 0.12mmHg or 0.20 inH_2O can occur for a five (5)-degree rotation from the vertical.

12.5.3 Mounting Transmitters with Small Absolute or Differential Pressure Spans

To minimize positional effects on calibration (zero shift), take the appropriate mounting precautions for the respective Transmitter model. Ensure that the Transmitter is vertical when mounting models STA725, STA745, STA72S, STA74S and STA77S . You do this by leveling the Transmitter side-to-side and front-to-back.

Figure 49 shows how to level a Transmitter using a spirit level.

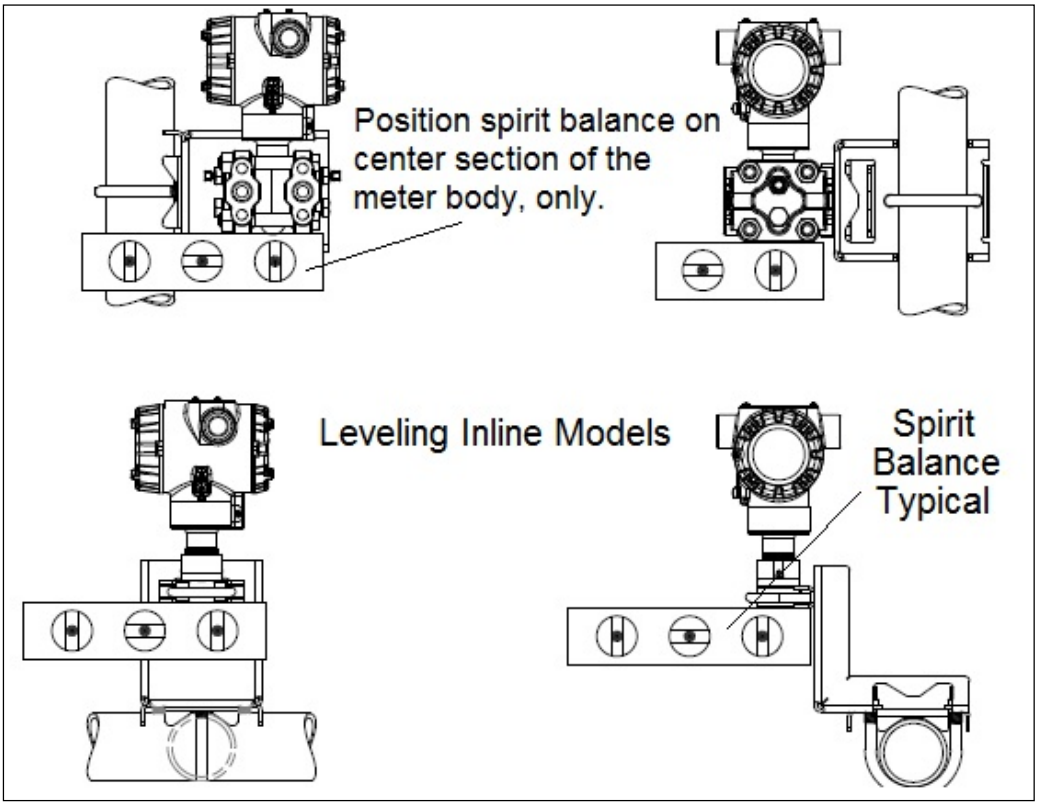

Figure 49 – ST 700 Basic Transmitter, using a Spirit Balance to Level a Transmitter

12.5.4 Flange Mounting_ST 700 Basic Transmitter

Figure 50 shows a typical tank-flange mount installation, with the Transmitter flange mounted to the pipe on the wall of the tank.

On insulated tanks, remove enough insulaiton to accommodate the flange extension.

When flange-mounting to a tank, note the following:

- The End User is responsible for providing a flange gasket and mounting hardware suitable for the Transmitter service conditions.
- To avoid degrading performance in flush-mounted flanged Transmitters, exercise care to ensure that the internal diameter of the flange gasket does not obstruct the sensing diaphragm.
- To prevent performance degradation in extended-mount flanged Transmitters, ensure that sufficient clearance exists in front of the sensing diaphragm body.

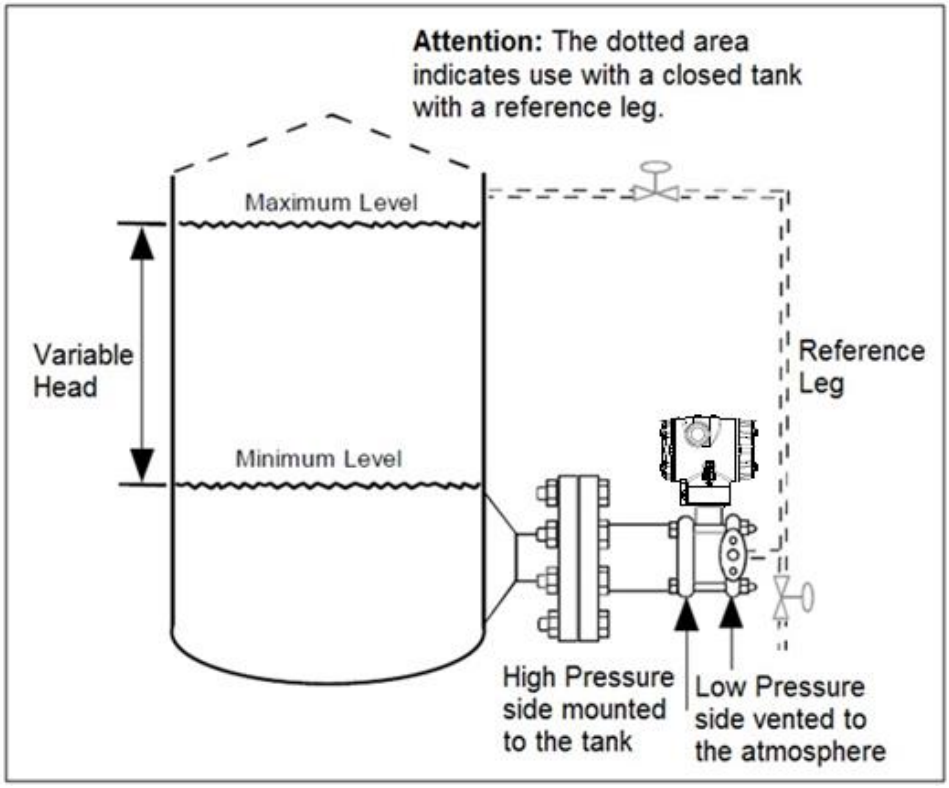

Figure 50 – ST 700 Basic Transmitter, Tank-Flange Mounted Transmitter

12.5.5 Remote Diaphragm Seal Mounting Information_ST 700 Basic Transmitter,

The combination of tank vacuum and high pressure capillary head effect should not exceed nine (9) psi (300mmHg) absolute. For insulated tanks, be sure to remove enough insulation to accommodate the flange extension. The end user is responsible for supplying a flange gasket and mounting hardware suitable for the service condition of the Transmitter.

Mount the Transmitter flanges within the limits in **Table 31**Table 6 for the fill fluid in the capillary tubes, with a tank at one (1) atmosphere.

Table 31 – ST 700 Basic Transmitter, Flange Mounting Guidelines

Fill Fluid	Mount the Flange…
Silicone 200 Oil	≤22 feet (6.7 meters) below the Transmitter
Chlorotrifluorethylene (CTFE)	≤11 feet (3.4 meters) below the Transmitter

Refer to Figure 51 for a representative remote diaphragm seal installation. Mount the Transmitter at a remote distance determined by the length of the capillary tubing.

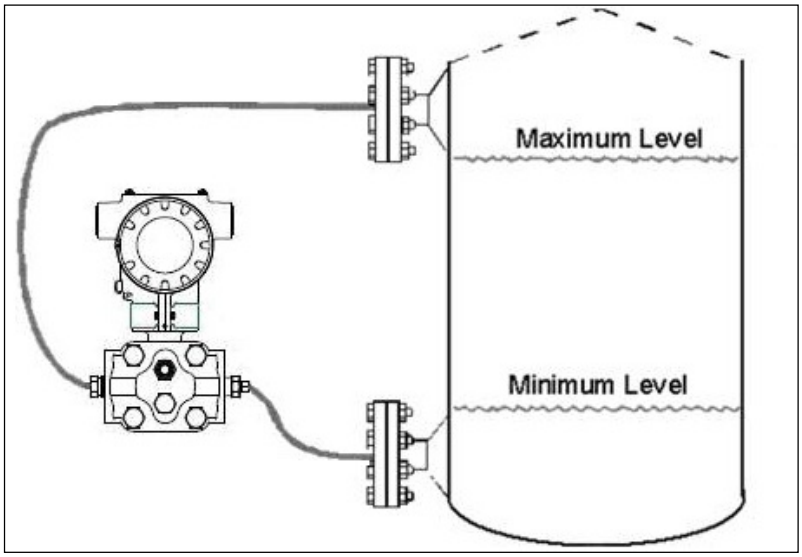

Figure 51 – ST 700 Basic Transmitter - Representative Remote Diaphragm Seal Transmitter Installation

Depending on Transmitter model, connect the remote seal to the tank according to Table 32

Table 32 – ST 700 Basic Transmitter - Remote Diaphragm Mounting Details

Transmitter Model	Connect the Remote Seal on ….	
	Variable Head	Fixed or Constant Head
STR735D	Transmitter High Pressure (HP) Side to tank wall lower flange mounting.	Transmitter Low Pressure (LP) side to tank wall upper flange.

12.6 Piping the ST 700 Basic Transmitter

12.6.1 Piping Arrangements

Piping arrangements vary depending upon process measurement requirements and the Transmitter model. For example, a differential pressure transmitter comes with double-ended process heads with ¼-inch NPT connections, which can be modified to accept ½-inch NPT through optional flange adapters. Gauge pressure transmitters are available with various connections for direct mounting to a process pipe.

A ½-inch, schedule 80, steel pipe is commonly used for Transmitter integration into a process system. Many piping arrangements use a three-valve manifold to connect the process piping to the Transmitter. A manifold makes it easy to install and remove or re-zero a Transmitter without interrupting the process. A manifold also accommodates the installation of blow-down valves to clear debris from pressure lines. Figure 52 represents a typical piping arrangement using a three-valve manifold and blow-down lines for a differential pressure transmitter being used to measure flow.

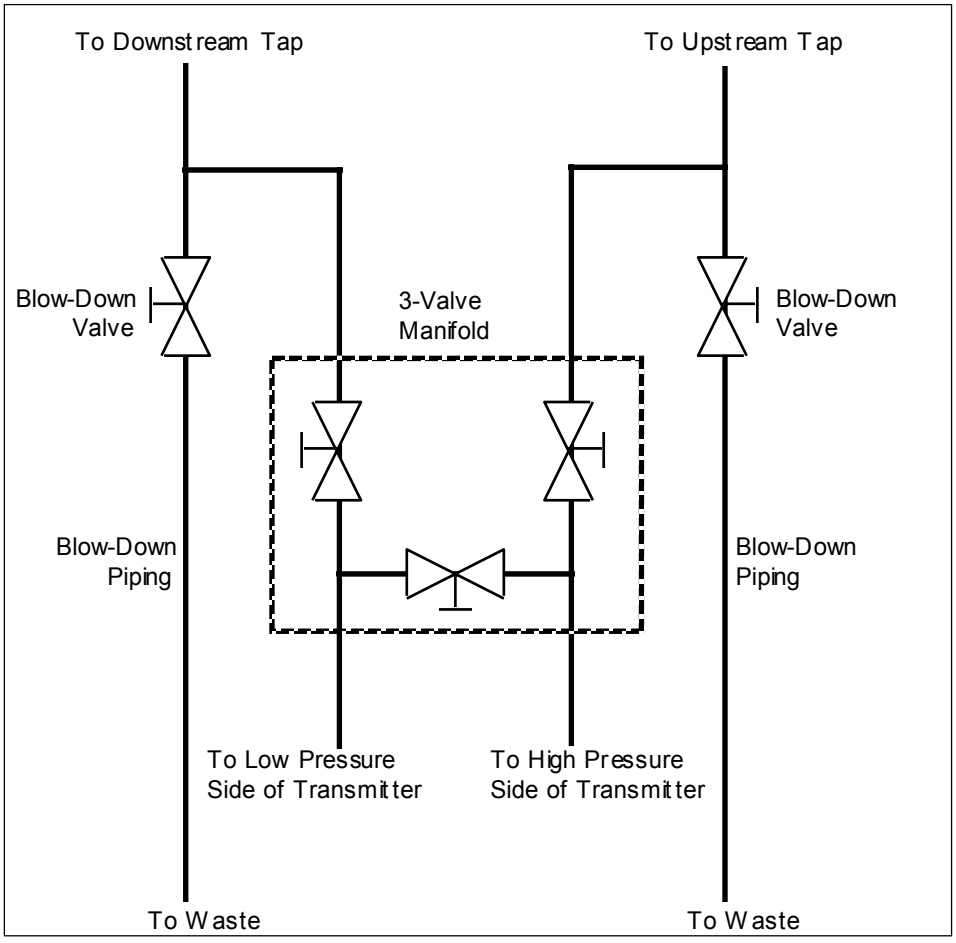

Figure 52– ST 700 Basic Transmitter - Typical 3-Valve Manifold with Blow-Down Piping

12.6.2 Suggestions for Transmitter Location

The following are suggested connections based on what is being processed by the system.

Table 33 – ST 700 Basic Transmitter - Suggested Connection Locations

Process	Suggested Location	Description
Gases	Above the gas line.	The condensate drains away from the Transmitter.
Liquids	Below but near the elevation of the process connection.	This minimizes that static head effect of the condensate.
	Level with or above the process connection.	This requires a siphon to protect theTransmitter from process steam. The siphon retains water as a *fill fluid*.

5. For liquid or steam, the piping should slope a minimum of 25.4mm (1 inch) per 305mm (1 foot).
6. Slope the piping down toward the Transmitter if it is below the process connection to allow the bubbles to rise back into the piping through the liquid.
7. If the transmitter is located above the process connection, the piping should rise vertically above the Transmitter. In this case, slope down toward the flow line with a vent valve at the high point.
8. For gas measurement, use a condensate leg and drain at the low point (freeze protection may be required here).

ATTENTION Care must be taken when installing transmitters on hot processes. The operating temperature limits for the device (as outlined in Table 5) must not be exceeded. Impulse piping may be used to reduce the temperature of the process that comes into contact with the transmitter meter body. As a general rule there is a 56°C drop (100°F) in the temperature of the process for every foot of ½ inch uninsulated piping.

12.6.3 General Piping Guidelines

- When measuring fluids that contain suspended solids, install permanent valves at regular intervals to blow-down piping.
- Blow-down all lines on new installations with compressed air or steam, and flush them with process fluids (where possible) before connecting these lines to the Transmitter Meter body.
- Verify that the valves in the blow-down lines are closed tightly after the initial blow-down procedure and each maintenance procedure thereafter.

12.6.4 Procedure to Install Flange Adapters

The following procedure provides the steps for removing and replacing an optional flange adapter on the process head. Refer to Figure 53.

This procedure does not require that the Meter body be removed from the Electronics Housing. If flange adapters are being replaced with parts from other kits (for example, process heads), follow the procedures for the kits and incorporate the following procedure.

The threaded hole in each Flange Adapter is offset from center. To ensure proper orientation for re-assembly, note the orientation of the offset relative to each Process Head **before removing the adapter**.

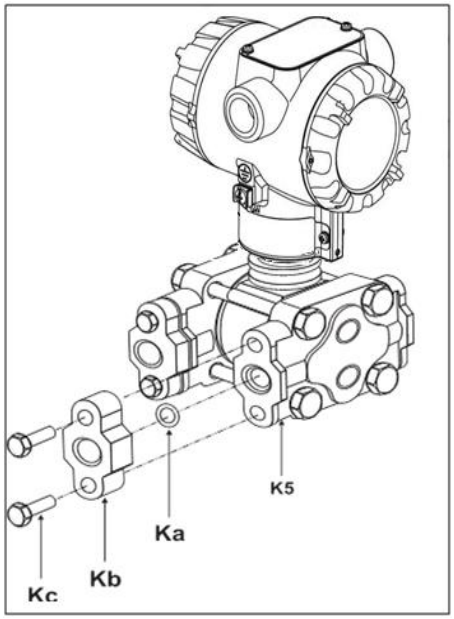

Figure 53 – ST 700 Basic Transmitter - Flange Adapter Removal and Replacement

Refer to the instructions included with the kit for removal and replacement procedures.

12.7 Wiring an ST 700 Basic Transmitter

12.7.1 Overview

The ST 700 basic transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range shown in Figure 54

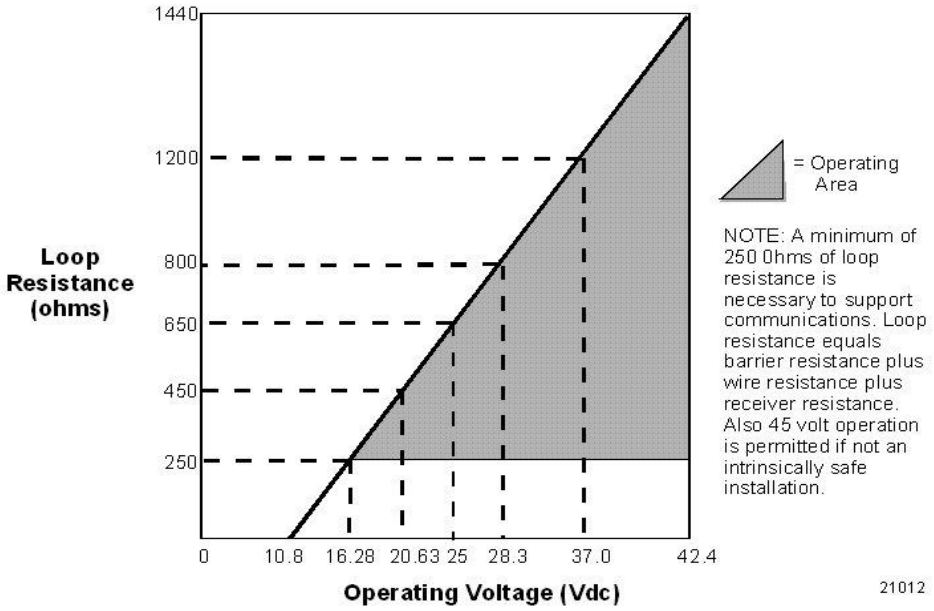

Figure 54 – ST 700 Basic Transmitter - Operating Ranges

Loop wiring is connected to the Transmitter by simply attaching the positive (+) and negative (–) loop wires to the positive (+) and negative (–) terminals on the Transmitter terminal block in the Electronics Housing shown in Figure 55

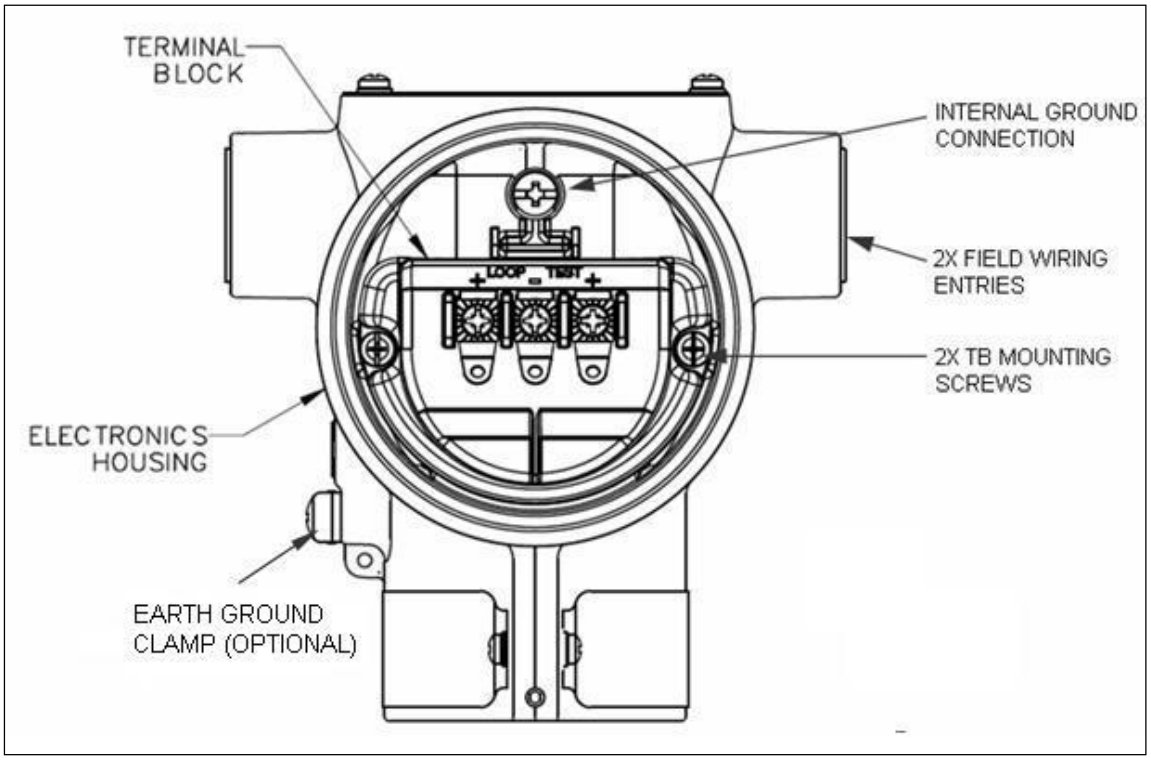

Figure 55 – ST 700 Basic Transmitter - 3-Screw Terminal Board and Grounding Screw

As shown in Figure 55 each Transmitter has an internal terminal to connect it to earth ground. Optionally, a ground terminal can be added to the outside of the Electronics Housing. While it is not necessary to ground the Transmitter for proper operation, doing so tends to minimize the possible effects of noise on the output signal and affords protection against lightning and static discharge. An optional lightning terminal block can be installed in place of the non-lightning terminal block for Transmitters that will be installed in an area that is highly susceptible to lightning strikes.

Wiring must comply with local codes, regulations and ordinances. Grounding may be required to meet various approval body certification, for example CE conformity. Refer to Appendix A of this document for details.

The Transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range; see Figure 54. With optional devices such as remote meter, the voltage drop for these options must be added to the basic 10.8-volt supply requirements to determine the required Transmitter voltage (V_{XMTR}) and maximum loop resistance ($R_{LOOP\ MAX}$). Additional consideration is required when sel*ecting* intrinsic safety barriers to ensure that they will supply at least minimum Transmitter voltage ($V_{XMTR\ MIN}$), including the required 250 ohms of resistance (typically within the barriers) needed for digital communications.

Transmitter loop parameters are as follows:
$R_{LOOP\ MAX}$ = maximum loop resistance (barriers plus wiring) that will allow proper Transmitter operation and is calculated as $R_{LOOP\ MAX} = (V_{SUPPLY\ MIN} - V_{XMTR\ MIN}) \div 21.8mA$.

In this calculation:

$V_{XMTR\ MIN} = 10.8V + V_{LP} + V_{SM}$
$V_{LP} = 0V$ for Honeywell supplied lightning protection option, LP
$V_{SM} = 2.3V$, remote meter

Note that V_{SM} should only be considered if a remote meter will be connected to the transmitter.

The positive and negative loop wires are connected to the positive (+) and negative (–) terminals on the terminal block in the Transmitter Electronics Housing.

Barriers can be installed per Honeywell's instructions for Transmitters to be used in intrinsically safe applications.

12.7.2 Digital System Integration Information

Transmitters that are to be digitally integrated to Honeywell's Total Plant Solution (TPS) system will be connected to the Pressure Transmitter Interface Module in the Process Manager, Advanced Process Manager or High Performance Process Manager through a Field Termination Assembly. Details about the TPS system connections are given in the *PM/APM SmartLine Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

If you are digitally integrating a Transmitter in an Allen Bradley Programmable Logic Controller (PLC) process system, the same Field Terminal Assembly (FTA) and wiring procedures used with Honeywell's TPS system are also used with the Allen-Bradley 1771 and 1746 platforms.

12.7.3 Wiring Variations

The above procedures are used to connect power to a Transmitter. For loop wiring and external wiring, detailed drawings are provided for Transmitter installation in non-intrinsically safe areas and for intrinsically safe loops in hazardous area locations.

If you are using the Transmitter with Honeywell's TPS system, see *PM/APM Smartline Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

12.7.4 Wiring Procedure

7. See Figure 55 above, for parts locations. Loosen the end cap lock using a 1.5mm Allen wrench.
8. Remove the end cap cover from the terminal block end of the Electronics Housing.
9. Feed loop power leads through one end of the conduit entrances on either side of the Electronics Housing. The Transmitter accepts up to 16AWG wire.
10. Plug the unused conduit entrance with the appropriate plug for the environment.
11. Connect the positive loop power lead to the positive (+) terminal and the negative loop power lead to the negative (-) terminal. Note that the Transmitter is <u>not</u> polarity-sensitive.
12. Replace the end cap, and secure it in place.

12.7.5 Lightning Protection

If your Transmitter includes the optional lightning protection, connect a wire from the Earth Ground Clamp (see Figure 15) to Earth Ground to make the protection effective. Use a size 8 AWG or ($8.37mm^2$) bare or green covered wire for this connection.

12.7.6 Supply Voltage Limiting Requirements

If your Transmitter complies with the ATEX 4 directive for self-declared approval per 94/9EC, the power supply has to include a voltage-limiting device. Voltage must be limited such that it does not exceed 42V DC. Consult the process design system documentation for specifics.

12.7.7 Process Sealing

The ST 700 SmartLine Pressure Transmitter is CSA-certified as a Dual Seal device in accordance with ANSI/ISA–12.27.01–2003, "Requirements for Process Sealing Between Electrical Systems and Flammable, or Combustible Process Fluids."

12.7.8 Explosion-Proof Conduit Seal

 When installed as explosion proof in a Division 1 Hazardous Location, keep covers tight while the Transmitter is energized. Disconnect power to the Transmitter in the non-hazardous area prior to removing end caps for service.

When installed as non-incendive equipment in a Division 2 hazardous location, disconnect power to the Transmitter in the non-hazardous area, or determine that the location is non-hazardous before disconnecting or connecting the Transmitter wires.

Transmitters installed as explosion proof in Class I, Division 1, Group A Hazardous (classified) locations in accordance with ANSI/NFPA 70, the US National Electrical Code, with 1/2 inch conduit do not require an explosion-proof seal for installation. If 3/4 inch conduit is used, a LISTED explosion-proof seal to be installed in the conduit, within 18 inches (457.2mm) of the Transmitter.

12.8 Startup

12.8.1 Overview

This section identifies typical start up tasks associated with several generic pressure measurement applications. It also includes the procedure for running an optional analog output check.

12.8.2 Startup Tasks

After completing the installation and configuration tasks for a Transmitter, you are ready to start up the process loop. Startup usually includes:

- Checking zero input
- Reading inputs and outputs
- Applying process pressure to the transmitter.

The actual steps in a startup procedure vary based on the type of Transmitter and the measurement application. In general, the procedures in this section are based on using Honeywell MC Toolkit to check the Transmitter input and output under static process conditions, and make adjustments as required initiating full operation with the running process. Note that similar checks can be made using the optional external 2-button assembly, where the Transmitter is equipped. Operation with the 2-button assembly is discussed in the Operation section.

When the Standard Display is connected, the two-button assembly for the Standard Display is present. The buttons will function 1 second after powering up.

12.8.3 Output Check Procedures

The Output Check comprises the following procedures:

- The Loop Test procedure checks for continuity and the condition of components in the output current loop.
- The Trim DAC Current procedure calibrates the output of the Digital-to-Analog converter for minimum (0%) and maximum (100%) values of 4mA and 20mA, respectively. This procedure is used for Transmitters operating online in analog mode to ensure proper operation with associated circuit components (for example, wiring, power supply, control equipment). Precision test equipment (an ammeter or a voltmeter in parallel with precision resistor) is required for the Trim DAC Current procedure.
- The Apply Values procedure uses actual Process Variable (PV) input levels for calibrating the range of a Transmitter. To measure a liquid level for example, a sight-glass can be used to determine the minimum (0%) and maximum (100%) level in a vessel. The PV is carefully adjusted to stable minimum and maximum levels, and the LRV and URV are then set by commands from the MC Toolkit.

The Transmitter does not measure the given PV input or update the PV output while it operates in the Output mode.

12.8.4 Constant Current Source Mode Procedure

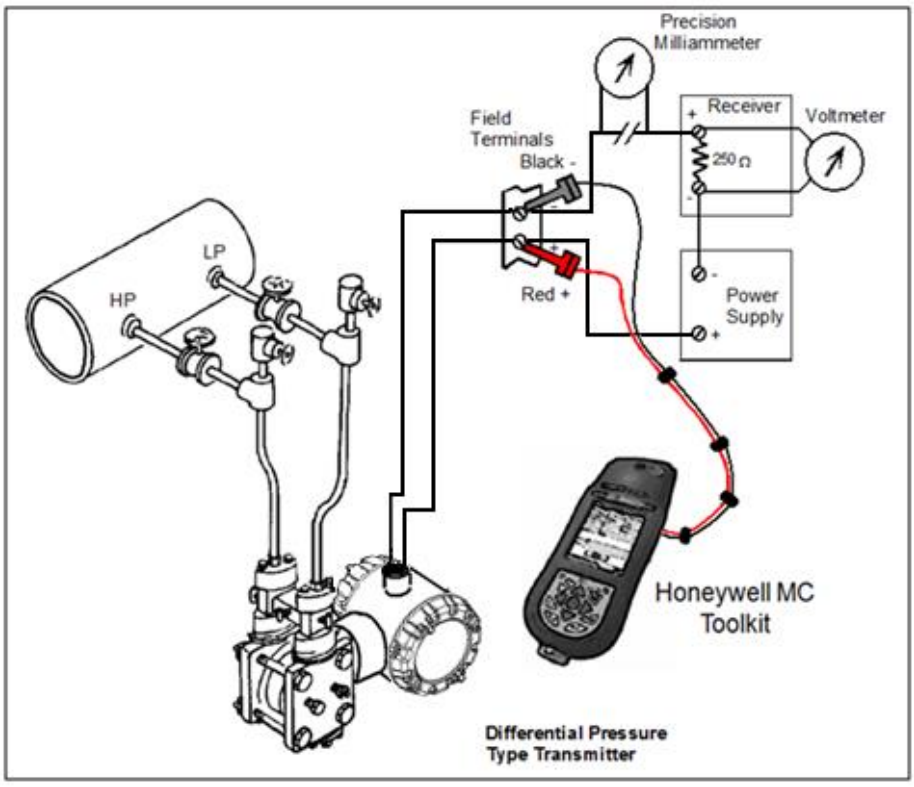

Figure 56 – ST 700 Basic Transmitter - Current Loop Test Connections

10. Refer to Figure 56 for test connections. Verify the integrity of electrical components in the output current loop.
11. Establish communication with the Transmitter. For these procedures, the values of components in the current loop are not critical if they support reliable communication between the Transmitter and the Toolkit.
12. On the Toolkit, display the **Output Calibration** box.
13. In the Output Calibration box, select the **Loop Test** button; the **LOOP TEST** box will be displayed.
14. Select the desired constant-level Output: 0%, 100%, or Other (any between 0% - 100%).
15. Select the Set button. A box will be displayed asking **Are you sure you want to place the transmitter in output mode?**

With the Transmitter in Analog mode, you can observe the output on an externally-connected meter or on a local meter. In DE mode, you can observe the output on the local meter or on the Toolkit Monitor display.

16. Select the **Yes** button. Observe the output current at the percentage you selected in Step 5.
17. To view the monitor display, navigate back from the **LOOP TEST** display, and select the **MONITOR** display. A **Confirm** popup will be displayed.
18. Select **Yes** to continue. This concludes the Startup procedure.

13. Operation_ST 700 Basic Transmitter

13.1 Overview

This section provides the information and processes involved for operation of ST 700 Basic Transmitter using the external two-button options.

13.2 External Two-Button Operation

The ST 700 Basic Transmitter optional external two-button interface provides a user interface and operation capability without opening the transmitter. Figure 57 shows the location of the two-button option and the labels for each button. See Table 37 for button operation.

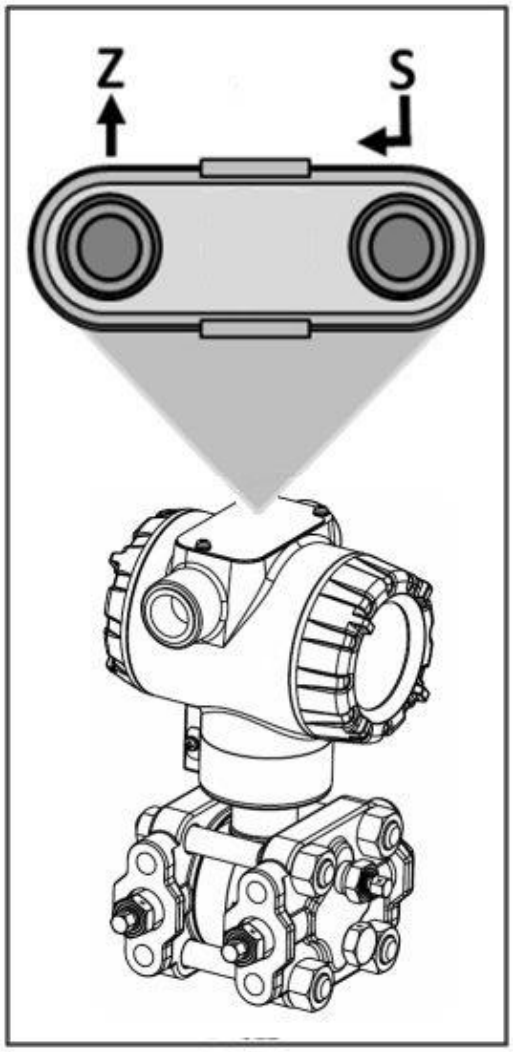

Figure 57 – ST 700 Basic Transmitter - Two-Button Option

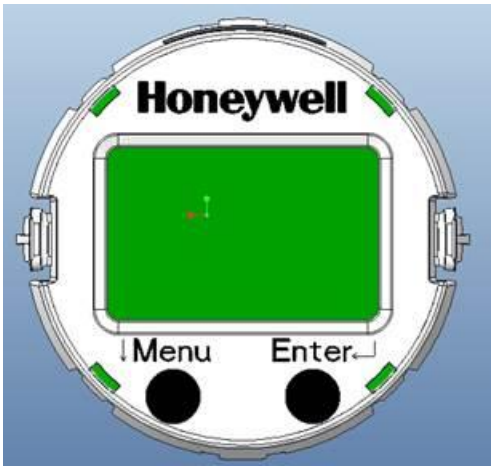

Figure 58 – ST 700 Basic Transmitter - Two-Button Option

13.2.1 The Standard Display Menu

The Standard Display Menu is implemented as one long single-level menu, after entering into Menu mode, and will "wrap around" when it reaches the end of the menu. To enter Menu mode select ↵ in PV display mode. Operation is as follows:

6. Select <**Exit Menu**> and press ↵ to exit the Menu.
7. Use the ↓ buttons to scroll through the list of menu items.
8. Press the ↵ button to select an item in Menu mode for data entry or activation. When an item is selected for data entry or activation, the cursor will jump to the lower line of the LCD to allow editing of the value. No action is taken against a menu item until the user presses the ↵ button.
9. If you want to abort a data entry operation, simply refrain from pushing any buttons for more than 10 seconds; the data entry operation will time out and the original value of the selected item will be preserved.
10. If you want to abort a menu operation, simply refrain from pushing any buttons for more than 60 seconds; the menu operation will time out and the exit from menu & it will show PV value.

The menu is divided into Standard Menu and Extended menu which can be enabled and disabled by Extended Menu Enable/Disable operation.

Note: The abort option is not available for Loop test parameter. The timeout for the DAC trim operation is more to enable user to calculate the loop current value to enter.

Table 34 – ST 700 Basic Transmitter: Standard Display Menus

13.2.2 Standard Display Abbreviations:

Table 36 – ST 700 Basic Transmitter - The Standard Display abbreviations

Abbreviation	Meaning
OOR	Out of Range
PRSPAN	Push reduce span
Wrng Mo	Wrong Mode
Illegal	Illegal Value
Wrt Err	NVM write error
Too Hi	Value/Parameter Too High
Too Lo	Value/Parameter Too Low
LRV Hi	LRV too High
LRV Lo	LRV too Low
LargeSP	Span too large
SmallSP	Span too small
Locked	Device is locked
Multidr	Device in multidrop mode
Wrt Prt	Device in write protect mode
NotSprt	Not supported
Hi LMT	Value is greater than high Limit value
Low LMT	Value is less than low Limit value

13.2.3 Data Entry

Data entry is performed from left to right. Select a character / digit by pressing ↓ buttons, and then press ↵ to advance to the next character position to the right. Select the cross-hatch character ▒ to terminate the entry or if the final character is already a space character, just press **<<** again.

All numeric entries are clamped at the low or high limit if needed. You can determine the low and high limit for a parameter by selecting either the **H** or **L** character while the cursor is positioned over the left-most digit and press ↵ button. The Display will show the selected limit.
For numeric entry sign is required to be entered only for negative numbers. For positive number, select space and move ahead.

Table 37 – ST 700 Basic Transmitter - Two-Button Data Entry

Screen Symbol	Numeric data entry
H	Display the high limit for this parameter. This symbol only appears in the left-most position of the data entry field.
L	Display the low limit for this parameter. This symbol only appears in the left-most position of the data entry field.
<<	Terminate the numeric entry
0 thru 9, Minus, Decimal	These characters are used to enter numeric values. The minus sign only appears in the left-most digit.

13.2.4 Editing a Numeric value

Editing a numeric value is a digit-by-digit process, starting with the left-most digit.

1. Press ↵ to begin the edit process.
2. The Standard Display will show the current value of the item on the lower line, left justified.
3. Press the ↓ buttons to select the desired digit, and then press ↵ to advance to the next digit to the right.
4. After the last digit has been entered, press ↵ one more time to write the new value to the transmitter.

13.2.5 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g. PV Display, Pressure Units, and so forth.).

1. Press ↵ to begin the edit process.
    a. The Standard Display will show the current setting of the item on the lower line
2. Press the ↓ buttons to scroll through the list of choices.
3. Press ↵ to make your selection. The new selection will be stored in the transmitter and will be displayed on the lower line

13.3 Two Button Operation with no Display Installed

When there is no Display installed, the buttons can be used to perform a Zero or Span adjustment and zero correction of the ST 700 Basic Transmitter. Caution should be taken to insure these adjustments are only made when the correct input pressures are applied.

13.3.1 Zero Adjustment

This adjustment is the same as performing a Set LRV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 56 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the Transmitter LRV.
3. Press the Zero (↑) button for more than 2 seconds to set the Zero.
4. Verify that the output is now 4 mA.

Note: Pressing the zero button for more than 5 seconds will ignore the button press.

13.3.2 Span Adjustment

This adjustment is the same as performing a Set URV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 56 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the desired Upper Range Value of the transmitter.
3. Press the **Span** (↵) button for more than 2 secondsr to set the span.
4. Verify that the PV output is now 20mA.

Note: Pressing the zero button for more than 5 seconds will ignore the button press.

13.3.3 Zero Correction

This adjustment is the same as performing a Zero correct using the Display.

1. Connect a current meter or voltmeter as shown in Figure 56 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the zero Value of the transmitter.
3. Press the Zero (↑) and **Span** (↵) buttons together for more than 5 sec to set the span.
4. Verify that the PV is set to 0 value.

Note: Pressing the SPAN button for more than 10 seconds will ignore the button press

You can also use the MCT Toolkit to make any adjustments to an ST 700 SmartLine Pressure Transmitter. Alternately, certain adjustments are possible through an Experion Station , if the ST 700 is digitally integrated with either of these stations.

13.4 Changing the Default Failsafe Direction

ST 700 Basic Transmitters are shipped with a default failsafe direction of upscale. This means that the Transmitter output will set the current output to upscale failsafe (maximum output) upon detection of a critical status. You can change the direction from upscale failsafe to downscale failsafe (minimum output) by moving the top jumper located in the Electronics module.

13.4.1 Procedure to Establish Failsafe Operation

The failsafe direction display accessible via the Toolkit shows only the state of the jumper as it correlates to analog Transmitter operation.

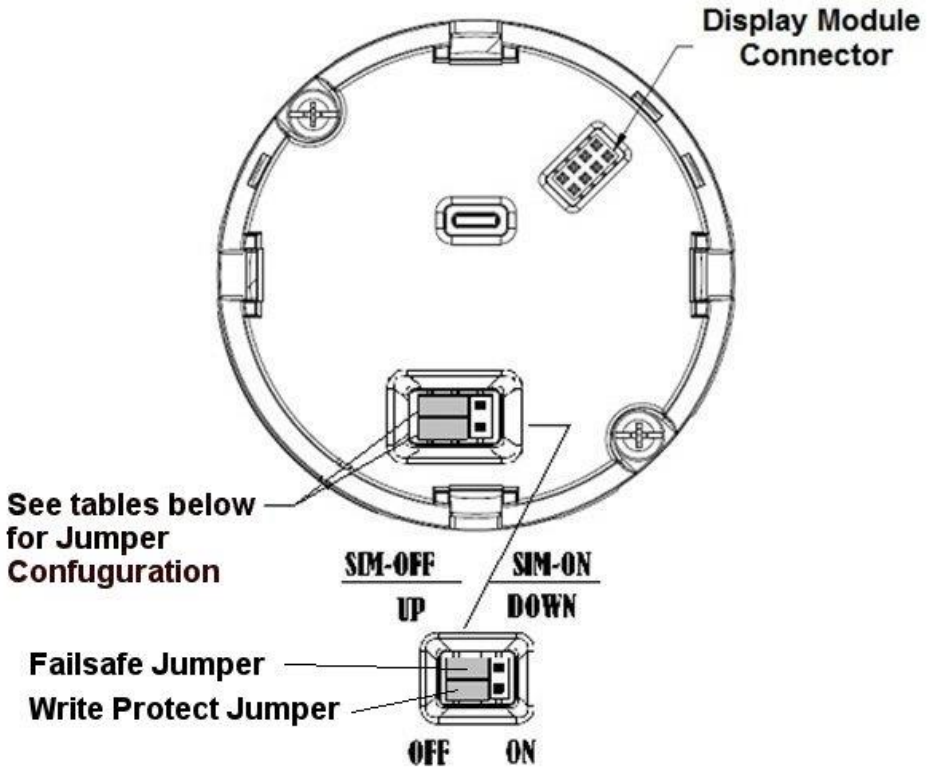
The integrated circuits in the Transmitter PWA are vunerable to damage by stray static discharges when removed from the Electronics Housing. Minimize the possibility of static discharge damage when handling the PWA as follows:

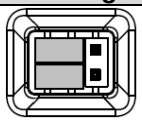
Do not touch terminals, connectors, component leads, or circuits when handling the PWA.

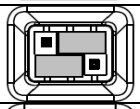
When removing or installing the PWA, handle it by its edges or bracket section only. If you need to touch the PWA circuits, be sure you are grounded by staying in contact with a grounded surface or by wearing a grounded wrist strap.

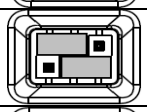
When the PWA is removed from the Transmitter, put it in an electrically conductive bag, or wrap it in aluminum foil to protect it.

The following procedure outlines the steps for positioning the write protect and failsafe jumpers on the electronics module. See Figure 59 for the locations of the failsafe and write protect jumpers.









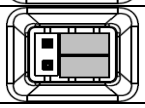


Figure 59 – ST 700 Basic Transmitter - Locating the Failsafe and Write Protect Jumpers

Table 38 – ST 700 Basic Transmitter - HART Failsafe and Write Protect Jumpers

Jumper Arrangements	Description
	Failsafe = UP (High) Write Protect = OFF (Not Protected)
	Failsafe = DOWN (Low) Write Protect = OFF (Not Protected)
	Failsafe = UP (High) Write Protect = ON (Protected)
	Failsafe = Down (Low) Write Protect = On (Protected)

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosionproof and Class 1 Div 2 environments).

2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.

3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.

4. If necessary, unplug the interface connector from the Communication module. Do not discard the connector.

5. Set the Failsafe Jumper (top jumper) to the desired position (UP or DOWN). See Figure 59? and Table 38 for jumper positioning.

6. If applicable, re-install the Display module as follows:

    - Orient the display as desired.
    - Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.
    - Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

    Note: Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.

    Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90° increments.

7. Restore transmitter power if removed.

13.5 Monitoring the Standard Displays

This section describes the information shown on the operator screens of the Standard Display.

13.5.1 Standard Display

- The PV value is user-configurable. This field has 6 characters. The maximum allowable numeric value is 999999 or -999999.
    - If fractional decimals are configured, the fractional positions will be dropped, as required.
    - If the PV value exceeds the above limits, it is divided by 1000 and "K" is appended to the result, allowing a maximum value with multiplier of 99999K or -99999K.

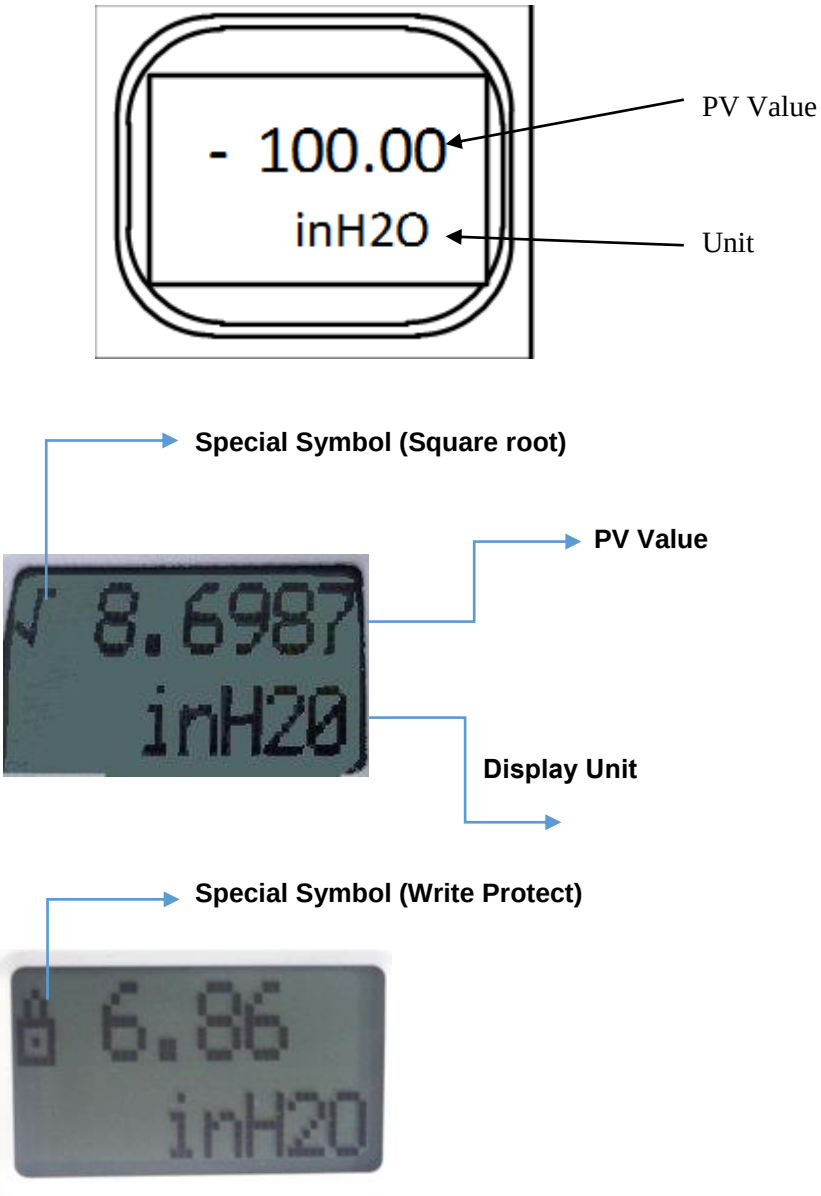

Figure 60 – ST 700 Basic Transmitter - Standard Display with Process Variable Format

14. Maintenance_ST 700 Basic Transmitter

14.1 Overview

This section provides information about preventive maintenance and replacing damaged parts. The topics covered in this section are:

- Preventive maintenance of the meter body barrier diaphragms and process piping to the Transmitter.
- Replacement of damaged parts such as the Transmitter Printed Wiring Assembly (PWA) and meter body

14.2 Preventive Maintenance Practices and Schedules

The ST 700 Basic Transmitter does not require any specific maintenance at regularly scheduled intervals. However, it is recommended that you perform these typical inspection and maintenance routines on a schedule that is dictated by the characteristics of the process medium and if blow-down facilities or purge systems are being used.

- Check piping for leaks.
- Clear piping of sediment or other foreign matter.
- Clean the Transmitter process heads, including the barrier diaphragms.

14.3 Inspecting and Cleaning Barrier Diaphragms

Depending on the characteristics of the process medium, sediment or other foreign particles may collect in the process head cavity/chamber and cause faulty measurement. In addition, the barrier diaphragm(s) in the Transmitter meter body may become coated with residue from the process medium. The latter is also true for external diaphragms on flange-mount and remote seal type Transmitters.

In many cases, you can readily remove the process head(s) from the Transmitter meter body to clean the process head cavity and inspect the barrier diaphragm(s). For flange-mount and remote seal diaphragms, you may only need to run a purge line in the tank to rinse off the face of the diaphragm(s).

The following procedure comprises the general steps for inspecting and cleaning barrier diaphragms. You may have to modify these steps to meet your particular process or transmitter model requirements. Figure 61 shows an exploded view of a Differential Pressure (DP) Transmitter meter body for reference. For disassembly/reassembly purposes, Gauge Pressure (GP) and Absolute Pressure (AP) Transmitters are similar.

It is recommended that you remove the Transmitter from service and move it to a clean area before disassembling it.

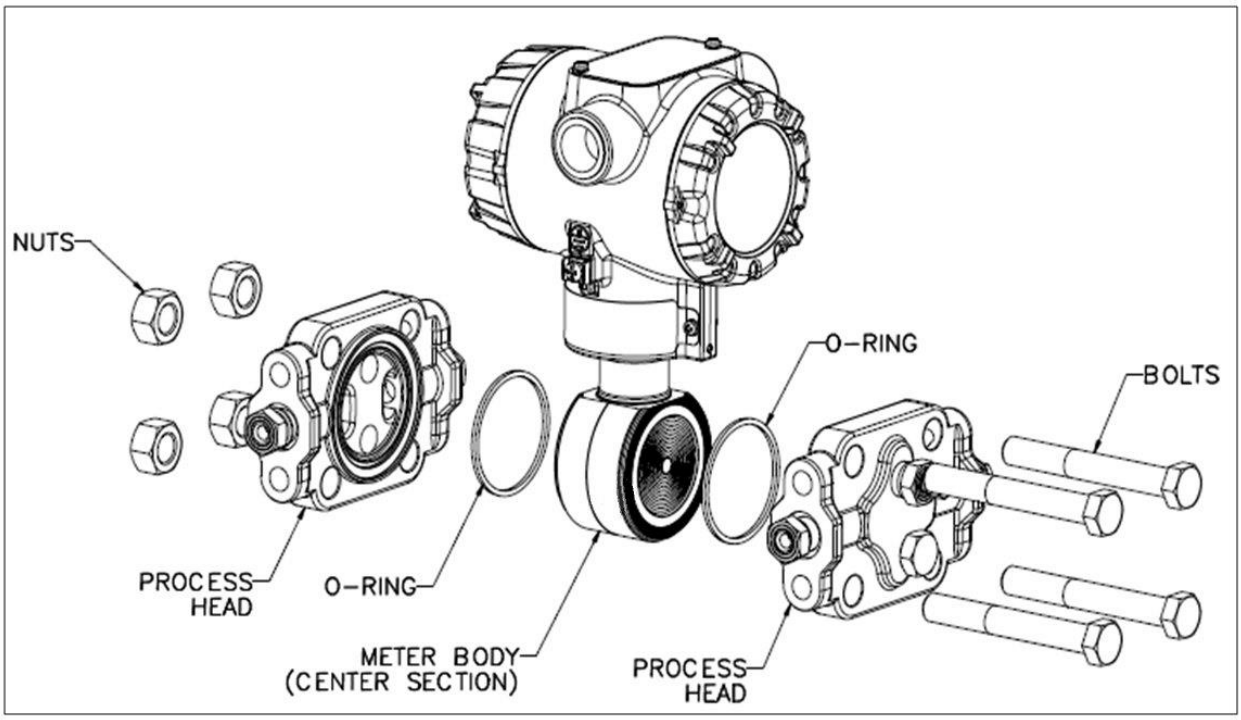

Figure 61 – ST 700 Basic Transmitter - DP Transmitter Head Disassembly

13. Close all valves to isolate the Transmitter from the process.
14. Open the vent in the process head to drain fluid from the Transmitter meter body, as necessary.
15. Remove the Transmitter from the process.
16. Loosen the nuts in the sequence shown in Figure 62
17. Remove the nuts from the bolts that hold the process head(s) to the meter body.
18. Remove the process heads and bolts.
19. Remove the gasket/ O-ring, and clean the interior of the process head using a soft bristle brush and an approved solvent.
20. Inspect the barrier diaphragm for signs of deterioration, corrosion, and distortion.
21. If the diaphragm is distorted contact Honeywell for assistance.
22. Install a new gasket/O-ring in each process head.
23. Coat threads on the process head bolts with a suitable anti-seize compound, such as "Neverseize," or equivalent.
24. Using a torque wrench, gradually tighten the nuts in the sequence shown in Figure 62
25. Tighten head bolts in stages of 1/3-full torque, 2/3-full torque, and full torque. See Table 39 or torque requirements versus Transmitter type and model.

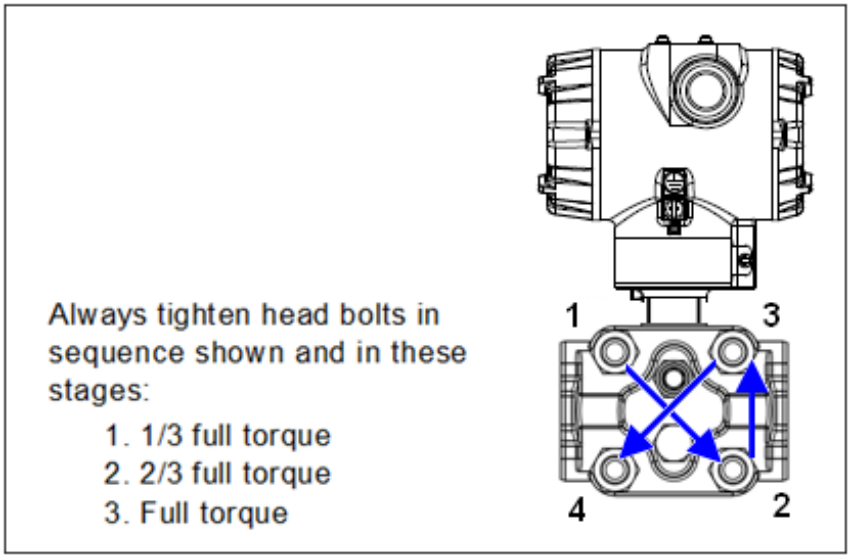

Figure 62 – ST 700 Basic Transmitter - Head Bolt Tightening Sequence

Table 39 – Head Bolt Torque Values

Bolting Type	**50049713XXXX all transmitters except draft range (XXX5)**	**50049713XXX5 Draft Range Transmitter only**
Super Duplex Bolting Option Bolt 514452557-006 Nut 51452559-006	48,8 N-M +/- 2,4 N-M (36.0 Lb-Ft +/- 1.8 Lb-Ft)	
316 Stainless Steel Bolting Option Bolt 51452557-003 Nut 51452559-004	56,9 N-M +/- 2,8 N-M (42.0 Lb-Ft +/- 2.1 Lb-Ft)	
Grade 660 NACE Bolts/NACE 304 Nuts Option Bolt 51452557-002 Nut 51452559-002		20,3 N-M (16.0 Lb-Ft +/- 0.8 Lb-Ft)
Grade 660 NACE Bolting Option Bolt 51452557-002 Nut 51452559-008	67,8 N-M +/- 3,4 N-M (50.0 Lb-Ft +/- 2.5 Lb-Ft)	
Carbon Steel Bolting Option Bolt 51452557-001 Nut 51452559-001		

14.4 Replacing the Communication Module

The Communication module includes a connector to the sensor ribbon cable and a connector to the optional Display module. This section includes the procedure to replace the Communication module.

The transmitter does not have to be removed from service to replace the Comm Module

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

Refer to Figure 63 for parts locations.

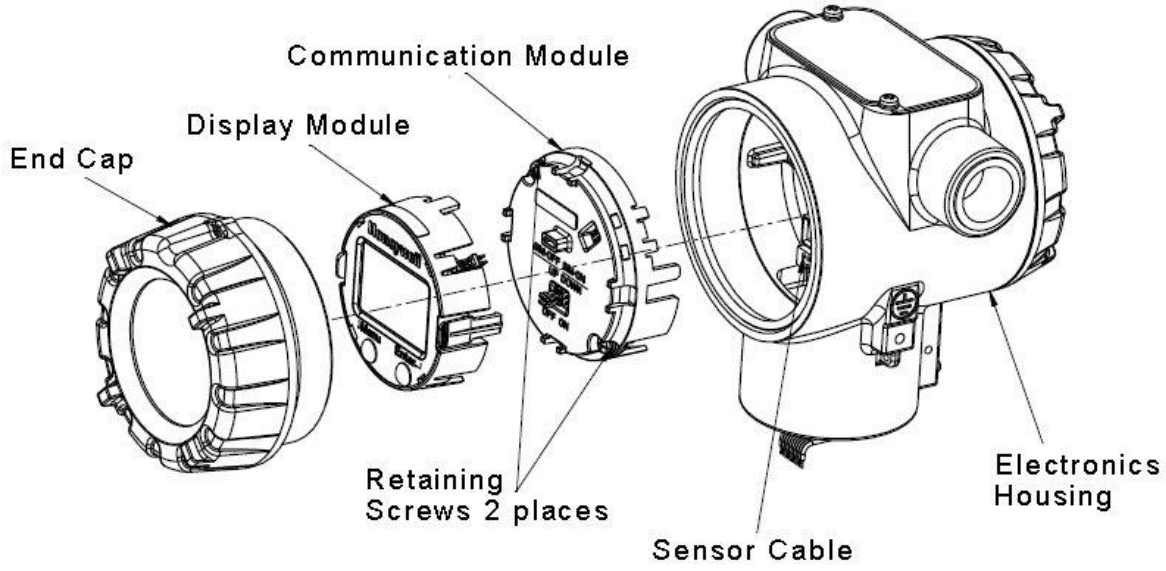

Figure 63 – ST 700 Basic Transmitter - PWA Replacement

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosion-proof and Class 1 Div 2 environments).
    - When removing the Communications Module with power applied, the loop will go to 0V. Likewise, installing a Communications Module into a transmitter with power applied will cause the loop output value to go to 12ma for several seconds then the loop output value will go to the configured value based on the PV input.

    - Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.

2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.
3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.

4. If necessary, unplug the interface connector from the Communication module. **Do not discard the connector**.
5. Loosen the two retaining screws, and carefully pull the Communication module from the Electronics compartment.

6. Carefully align and connect the Sensor Ribbon Cable to the connector "J4" at the bottom of the Communication module. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.

7. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.

8. Tighten the two Communication module retaining screws.

9. Refer to the SmartLine User's Manual to change the FAILSAFE, READ/WRITE configuration settings.

10. If applicable, re-install the Display module as follows:

    d. Orient the display as desired.

    e. Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.

    f. Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90 º increments.

11. Apply Parker Super O-ring Lubricant or equivalent to the end cap O-ring before installing the end cap. Reinstall the End Cap and tighten the End Cap locking screw.

12. Installing Optional External Configuration Button Assembly.

    d. Loosen (Do Not Remove) both top nameplate screws and pivot nameplate 90°.

    e. Align the protrusion on the button assembly with the matching opening in the housing and snap the button assembly into the housing.

    f. Rotate the nameplate back to the original position, and tighten the nameplate screws.

14.5 Replacing the Meter Body

You can replace the complete meter body, including the process heads, or the meter body only on certain Differential Pressure (DP), Gauge Pressure (GP), and Atmospheric Pressure (AP) Transmitters by using the existing process head(s). Use the following procedure for meter body-only replacement.

1. Save or record device configuration data.
2. Turn off Transmitter power.
3. Remove the Transmitter from service, and move it to a clean area before disassembling it.
4. Refer to Figure 64. Loosen the End Cap Lock, and unscrew the End Cap from the electronics side of the Transmitter housing.

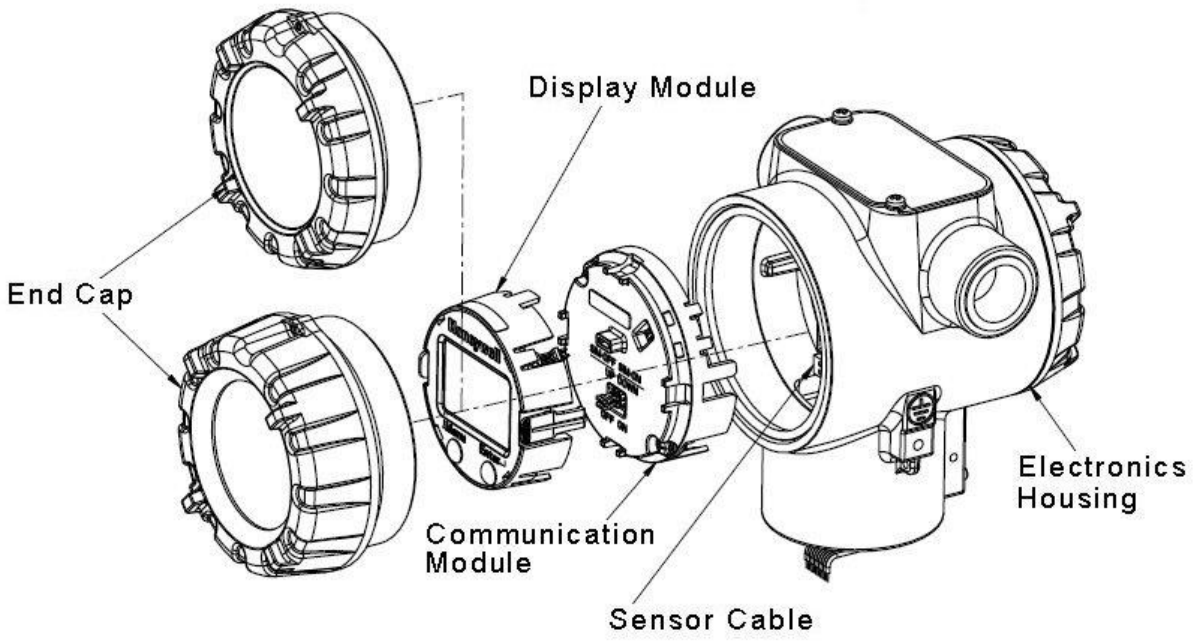

Figure 64 – ST 700 Basic Transmitter - Disassembly for Meter Body Replacement

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

5. If a display is present, press the two snaps along the side, and remove it from the communication module assembly.
   Note: Do not discard or misplace the Display/Communication connector, it will be required to reassemble the Display Module
6. Loosen the two retaining screws, and remove the Communications Module assembly, and remove the Communication Module assembly from the electronics housing.
7. Disconnect the Sensor Cable from the Communications Board.
8. Refer to Figure 66. Use a 2mm hex wrench to completely loosen the set screw on the outside of the housing to permit rotating the meter body.

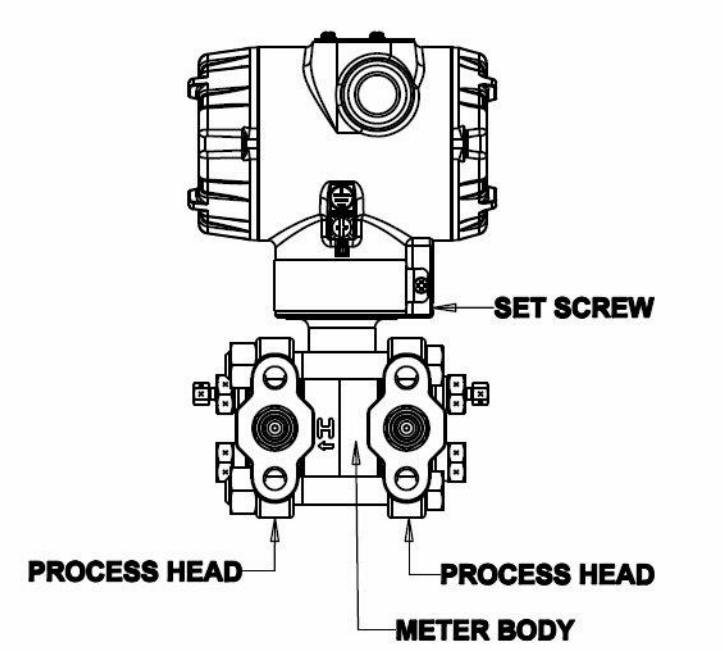

Figure 65 – ST 700 Basic Transmitter - Hardware Location to Remove the Meter Assembly

9. Carefully turn the complete meter body counterclockwise to unscrew it from the electronics housing.
10. Remove the nuts from bolts that hold the process head(s) to the Meter Body.
11. Remove process heads and bolts.
12. Remove the gaskets or O-rings from the process heads.
13. Clean the interior of the process head(s) with a soft bristle brush and suitable solvent.

CAUTION: To prevent damage to the diaphragm in the Meter Body, use extreme care when handling or placing the Meter Body on any surface. Carefully assemble gaskets or O-rings to the meter body. If installing O-rings, lubricate with water or leave dry.

14. Coat threads on process head bolts with anti-seize compound such as "Neverseize" or equivalent.
15. Refer to Figure 66. Apply Dow Corning #33 silicone grease to the meter body adapter O-ring and carefully assemble the O-ring to the meter body. Assemble the process head(s) and bolts to the new meter body. For now, make the bolts only finger-tight.

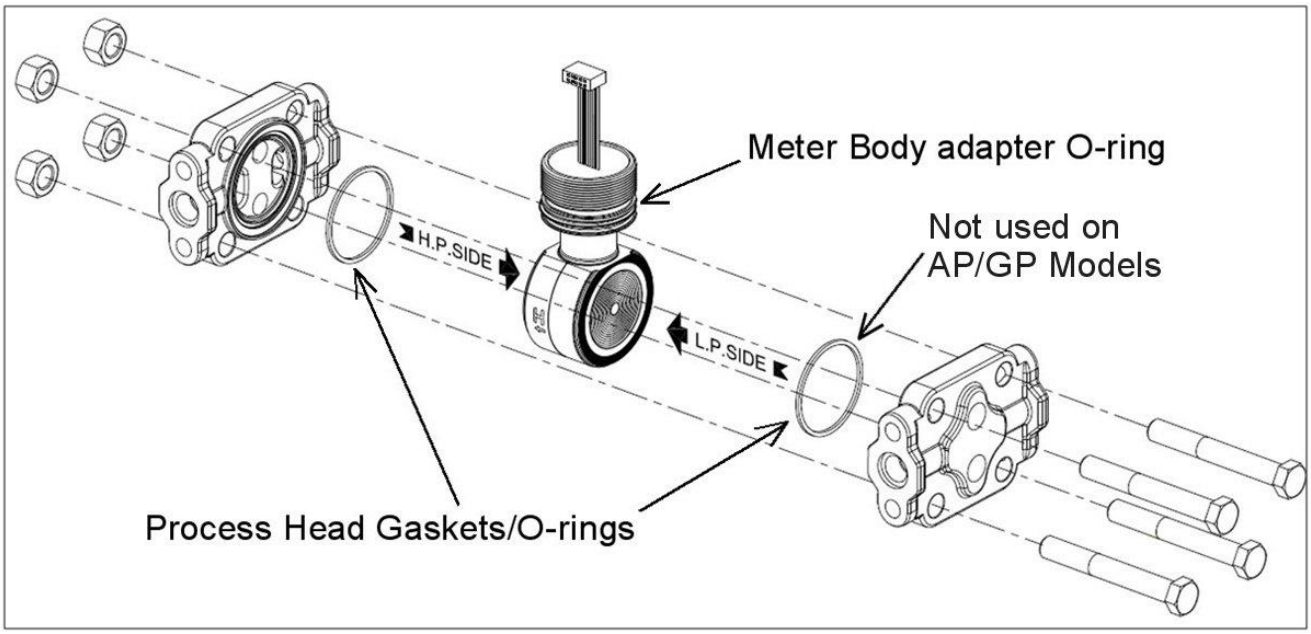

Figure 66 – ST 700 Basic Transmitter - Meter Body Reassembly

16. Use a torque wrench to gradually tighten nuts to torque rating in sequence shown in Figure 67. Tighten head bolts in stages of 1/3 full torque, 2/3 full torque, and then full torque as per Table 39.

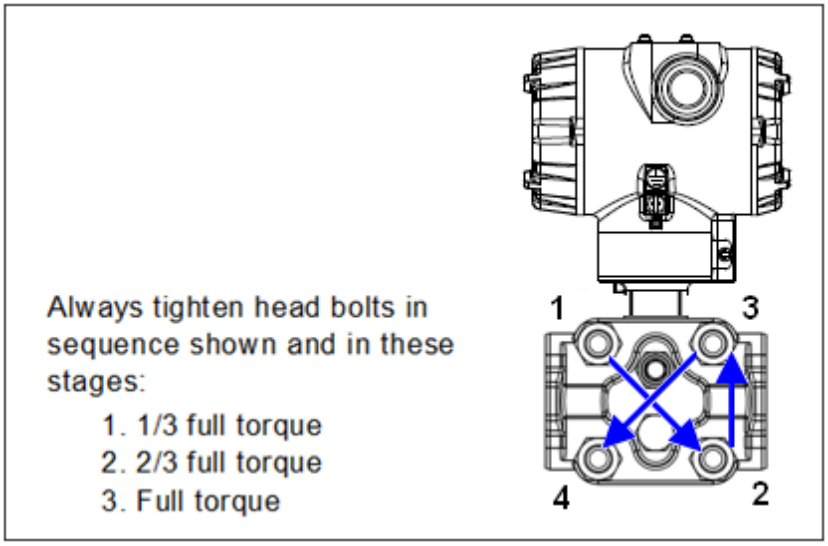

Figure 67 – ST 700 Basic Transmitter - Head Bolt Tightening Sequence

17. Feed the ribbon cable on the new meter body through the neck of the housing.

CAUTION: To prevent damage to the ribbon cable, use care when assembling the Meter Body to the electronics housing.

18. Screw the new meter body into the housing until the bottom of the Meter Body adapter is flush with the neck of the electronics housing.

19. Tighten the outside set screw to be sure it is fully seated in the slot in the header.
20. Loosen the set screw ½- turn.
21. Rotate the housing to the desired position (Max. 180^{o} in either direction), and tighten the set screw.
22. Carefully align and connect the Sensor Ribbon Cable to connector "J4" at the bottom of the Communication module board. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.
23. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.
24. Tighten the two Communication module retaining screws.
25. If applicable, re-install the Display module as follows:
    d. Orient the display as desired.
    e. Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.
    f. Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window.
You can rotate the meter mounting orientation in 90 o increments.

26. Connect the bracket to the Transmitter housing.
27. Recalibrate the Transmitter per section Calibration_ST 700 Basic Transmitter, of this document.
28. Return the Transmitter to service, and turn ON power
29. Verify the Transmitter configuration data. Restore the saved database if necessary.
30. Lubricate the end-cap O-ring with Parker Super O-ring silicone lubricant or equivalent before replacing the end caps.

15. Calibration_ST 700 Basic Transmitter

15.1 Recommendations for Transmitter Calibration

The ST 700 Basic Transmitter does not require periodic calibration to maintain accuracy. Typically, calibration of a process-connected Transmitter will degrade, rather than augment the capability of a smart Transmitter. For this reason, it is recommended that a Transmitter be removed from service before calibration. Moreover, calibration will be accomplished in a controlled, laboratory-type environment, using certified precision equipment.

15.2 Calibration Procedures

For a transmitter operating in analog mode, you must calibrate its output signal measurement range using any compatible hand-held communicator or a local display.

One calibration option is to use the Honeywell Smart Field Communicator (SFC). Refer to the *Smart Field Communicator Operating Guide,* Document # 34-ST-11-14 for calibration procedures.

Calibration information and procedures for a Transmitter operating in the HART/DE mode are provided in the *ST 700 Series HART/DE Option User's Manual*, Document # 34-25-25-47.

16. Troubleshooting_ST 700 Basic Transmitter

16.1 Overview

Troubleshooting involves responding to error messages, primarily displayed by the MC Toolkit. Error messages that may occur on the Transmitter's local display are fairly self-explanatory and intuitive. However, this section covers the diagnostic messages that indicate critical conditions. Other than the critical conditions, additional detail is not provided. If you require assistance, contact your distributor or Honeywell Technical Support. All other messages are covered by the MC Toolkit Users' Manual.

16.2 Critical Diagnostics Screens

The Standard Display will display the fault message on the top line of the LCD .

16.2.1 Fault Conditions and Recommended Corrective Actions – Standard Display

The Standard Display will display the message FAULT on the top line of the LCD and the appropriate diagnostic text on the lower line.

Table 40 – ST 700 Basic Transmitter - Fault Conditions and Recommended Corrective Actions.

Condtion	Analysis	Recommended Corrective Action
Mbd Com (Meter body Comm fault)	Communications between the Meter body and the Electronics Module has failed.	Check the ribbon cable that connects the Meter body to the Electronics Module. Ensure that the cable is securely plugged into the Electronics Module. Ensure that all pins are plugged into the connector (e.g. ensure that the connector is not offset in a way that leaves some pins unconnected). Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module. If this does not fix the problem, replace the Meter body.
Comm El (Communication Board fault)	A critical failure has been detected on the HART Electronics Module.	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.
Mtrbody (Sensor Board Fault)	A critical failure has been detected in the Meter body	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.

17. Parts List_ST 700 Basic Transmitter

17.1 Overview

Individually saleable parts for the various Transmitter models are listed in this section. Some parts are illustrated for identification. Parts are identified and listed in the corresponding tables as follows:

- Individually saleable parts are indicated in each figure by key number callout.
- Parts that are supplied in kits are indicated in each illustration by key number callout with the letter K prefix.

Table 41 is a list of recommended spare parts.

Table 41 – ST 700 Basic Transmitter - Summary List of Recommended Spare Parts

Appendix A - PRODUCT CERTIFICATIONS for the ST 700 Standard and Basic Transmitter

A.1 Safety Instrumented Systems (SIS) Installations

For Safety Certified Installations, please refer to the ST 800 and ST 700 Safety Manual 34-ST-25-37 for installation procedure and system requirements.

SIL 2/3 Certification	IEC 61508 SIL 2 for non-redundant use and SIL 3 for redundant use under the following standards: IEC61508-1: 2010; IEC 61508-2: 2010; IEC61508-3: 2010.

EU DECLARATION OF CONFORMITY

We,
Honeywell International Inc.
Honeywell Field Solutions
512 Virginia Drive
Fort Washington, PA 19034 USA

declare under our sole responsibility that the following products,

ST 800 – Smart Series Pressure Transmitter
And
ST 700- Smart Series Pressure Transmitter

to which this declaration relates, is in conformity with the provisions of the European Community Directives, including the latest amendments, as shown in the attached schedule.

Assumption of conformity is based on the application of the harmonized standards and when applicable or required, a European Community notified body certification, as shown in the attached schedule.

The authorized signatory to this declaration, on behalf of the manufacturer, and the Responsible Person is identified below.

Owen J. Murphy
Product Safety & Approvals Engineering

Notes

1. Operating Parameters:

DE/HART	Voltage= 11 to 42 V	Current= 4-20 mA Normal (3.8 – 23 mA Faults)
Foundation Fieldbus	Voltages = 9 to 23 V	Current = 25 mA

2. Intrinsically Safe Entity Parameters

For details see Control Drawing on page 140.

3. Marking ATEX Directive

General:

The following information is provided as part of the labeling of the transmitter:

- Name and Address of the manufacturer
- Notified Body identification: DEKRA Quality B.V., Arnhem, the Netherlands
- For complete model number, see the Model Selection Guide for the particular model of pressure transmitter.
- The serial number of the transmitter is located on the Meter Body data-plate. The first two digits of the serial number identify the year (02) and the second two digits identify the week of the year (23); for example, 0223xxxxxxxx indicates that the product was manufactured in 2002, in the 23 rd week.

Apparatus Marked with Multiple Types of Protection

The user must determine the type of protection required for installation the equipment. The user shall then check the box [ ] adjacent to the type of protection used on the equipment certification nameplate. Once a type of protection has been checked on the nameplate, the equipment shall not then be reinstalled using any of the other certification types.

4. WARNINGS and Cautions:

Intrinsically Safe and Non-Incendive Equipment:
WARNING: SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR USE IN HAZARDOUS LOCATIONS.
Explosion-Proof/ Flameproof:
WARNING: DO NOT OPEN WHEN AN EXPLOSIVE ATMOSPHERE MAY BE PRESENT
Non-Incendive Equipment:
WARNING: DO NOT OPEN WHEN AN EXPLOSIVE ATMOSPHERE MAYBE PRESENT
WARNING: FOR CONNECTION IN AMBIENTS ABOVE 60ºC USE WIRE RATED 105oC

5. Conditions of Use for Ex Equipment, "Hazardous Location Equipment" or "Schedule of Limitations":

Painted surface of the ST800 may store electrostatic charge and become a source of ignition in applications with a low relative humidity less than approximately30% relative humidity where the painted surface is relatively free of surface contamination such as dirt, dust or oil. Cleaning of the painted surface should only be done with a damp cloth.

Flame-proof Installations: The Transmitter can installed in the boundary wall between an area of EPL Ga/ Class I Zone 0/ Category 1 and the less hazardous area, EPL Gb/ Class I Zone 1/ Category 2. In this configuration, the process connection is installed in EPL Ga/ Class I Zone 0/ Category 1, while the transmitter housing is located in EPL Gb/ Class I Zone 1/ Category 2.

The applicable temperature class, ambient temperature range and maximum process temperature of the equipment is as follows;
T5 for -50°C < Ta < 85°C
T6 for -50°C < Ta < 65°C
Maximum process temperature = 125°C

Consult the manufacturer for dimensional information on the flameproof joints for repair.

The Transmitter can be installed in the boundary wall between an area of Category 1 and the less hazardous area, Category 2. In this configuration, the process connection is installed in Category 1 while the transmitter housing is installed in Category 2.

Intrinsically Safe: Must be installed per drawing 50049892

Division 2: This equipment is suitable for use in a Class I, Division 2, Groups A, B, C, D; T4 or Non-Hazardous Locations Only.

The enclosure is manufactured from low copper aluminum alloy. In rare cases, ignition sources due to impact and friction sparks could occur. This shall be considered during Installation, particularly if equipment is installed a Zone 0 location.
If a charge-generating mechanism is present, the exposed metallic part on the enclosure is capable of storing a level of electrostatic that could become incendive for IIC gases. Therefore, the user/ installer shall implement precautions to prevent the buildup of electrostatic charge, e.g. earthing the metallic part. This is particularly important if equipment is installed a Zone 0 location.

ST 800/ ST 700 Series Pressure,
ANALOG, HART/DE and FF/ PA Communications

1. Intrinsically safe installation shall be in accordance with
   a. FM (USA): ANSI/NFPA 70, NEC® Articles 504 and 505.
   b. CSA (Canada): Canadian Electrical Code (CEC), part I, section 18.
   c. ATEX: Requirements of EN 60079-14, 12.3 (See also 5.2.4).
   d. IECEx: Requirements of IEC 60079-14, 12.3 (See also 5.2.4).
2. ENTITY approved equipment shall be installed in accordance with the manufacturer's Intrinsic Safety Control Drawing.
3. The Intrinsic Safety ENTITY concept allows the interconnection of two ENTITY Approved Intrinsically safe devices with ENTITY parameters not specifically examined in combination as a system when:

   Uo, Voc, or Vt ≤ Ui or Vmax; Io, Isc, or It ≤ Ii or Imax; Ca or Co ≥ Ci + Ccable, La or Lo ≥ Li + Lcable, Po ≤ Pi. Where two separate barrier channels are required, one dual-channel or two single-channel barriers may be used, where in either case, both channels have been Certified for use together with combined entity parameters that meet the above equations.
4. System Entity Parameters:

   ST 800/ ST 700 Transmitter: Vmax Voc or Uo, Imax Isc or Io;
   ST 800/ ST 700 Transmitter: Ci + Ccable ≤ Control Apparatus Ca,
   ST 800/ ST 700 Transmitter: Li + Lcable ≤ Control Apparatus La.
5. When the electrical parameters of the cable are unknown, the following values may be used:

   Capacitance: 197pF/m (60 pF/ft)
   Inductance: 0.66µH/m (0.020µH/ft).
6. Control equipment that is connected to Associated Equipment must not use or generate more than 250 V.
7. Associated equipment must be FM, CSA ATEX or IECEx (depending on location) listed. Associated equipment may be installed in a Class I, Division 2 or Zone 2 Hazardous (Classified) location if so approved.
8. Non-Galvanically isolated equipment (grounded Zener Barriers) must be connected to a suitable ground electrode per:
   a. FM (USA): NFPA 70, Article 504 and 505. The resistance of the ground path must be less than 1.0 ohm.
   b. CSA (Canada): Canadian Electrical Code (CEC), part I, section 10.
   c. ATEX: Requirements of EN 60079-14, 12.2.4.
   d. IECEx: Requirements of IEC 60079-14, 12.2.4.
9. Intrinsically Safe DIVISION 1/ Zone 0 WARNING: SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR USE IN HAZARDOUS LOCATIONS.
10. Division 2/ Zone 2: WARNING: DO NOT OPEN WHEN AN EXPLOSIVE GAS ATMOSPHERE IS PRESENT.
11. NO REVISION OF THIS CONTROL DRAWING IS PERMITTED WITHOUT AUTHORIZATION FROM THE AGENCIES listed.
12. For release approvals see ECO # 0094464.

About This Manual

This manual is a detailed *how to* reference for installing, piping, wiring, configuring, starting up, operating, maintaining, calibrating, and servicing Honeywell's family of ST 800 SmartLine Pressure Transmitters. Users who have a Honeywell ST 800 SmartLine Pressure Transmitter configured for HART protocol or Honeywell's Digitally Enhanced (DE) are referred to the *ST 800 Series HART/DE Option User's Manual*, document number 34-ST-25-38. Users who have a Honeywell ST 800 SmartLine Pressure Transmitter configured for Fieldbus operation are referred to the *ST 800 Series Fieldbus Option User's Manual*, document number (34-ST-25-39).

The configuration of your Transmitter depends on the mode of operation and the options selected for it with respect to operating controls, displays and mechanical installation. This manual provides detailed procedures to assist first-time users, and it further includes keystroke summaries, where appropriate, as quick reference or refreshers for experienced personnel.

To digitally integrate a Transmitter with one of the following systems:

For the Experion PKS, you will need to supplement the information in this document with the data and procedures in the *Experion Knowledge Builder.*

For Honeywell's TotalPlant Solutions (TPS), you will need to supplement the information in this document with the data in the *PM/APM SmartLine Transmitter Integration Manual*, which is supplied with the TDC 3000 book set. (TPS is the evolution of the TDC 3000).

Release Information:

ST 800 SmartLine Pressure Transmitter User Manual, Document # 34-ST-25-35,

Rev. 1, October, 2012 – First Release
Rev. 2, January 2013 – Document # reference and meter body updates
Rev. 3, February 2013 – Parts list updates
Rev. 4, May 2013 – Updates to Parts list, Explosionproof Seal class, Fail Safe and Comms Module procedures.
Rev. 5, July 2013 – Control Drawing updated to Rev.D
Rev. 6, Feb 2014 - Advanced display updates. Approvals FISCO & GOST added. PILD, Dual and Triple Calibration added.
Rev.7, May 2014 – PILD, Basic Display and High Pass Frequency updates
Rev.8, July 2014 – PILD update referencing the Option upgrade instructions
Rev.9, December 2014 – MID and Marine Approvals added
Rev.10, July 2016 – DE added to voltage chart, Approval updates and EU cert.

Symbol Descriptions and Definitions

The symbols identified and defined in the following table may appear in this document.

Symbol	Definition
	**ATTENTION: Identifies information that requires special consideration.**
	**TIP: Identifies advice or hints for the user, often in terms of performing a task.**
CAUTION	**Indicates a situation which, if not avoided, may result in equipment or work (data) on the system being damaged or lost, or may result in the inability to properly operate the process.**
	**CAUTION: Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.** **CAUTION symbol on the equipment refers the user to the product manual for additional information. The symbol appears next to required information in the manual.**
	**WARNING: Indicates a potentially hazardous situation, which, if not avoided, could result in serious injury or death.** **WARNING symbol on the equipment refers the user to the product manual for additional information. The symbol appears next to required information in the manual.**
	**WARNING, Risk of electrical shock: Potential shock hazard where HAZARDOUS LIVE voltages greater than 30 Vrms, 42.4 Vpeak, or 60 VDC may be accessible.**
	**ESD HAZARD: Danger of an electro-static discharge to which equipment may be sensitive. Observe precautions for handling electrostatic sensitive devices.**
	**Protective Earth (PE) terminal: Provided for connection of the protective earth (green or green/yellow) supply system conductor.**
	**Functional earth terminal: Used for non-safety purposes such as noise immunity improvement. NOTE: This connection shall be bonded to Protective Earth at the source of supply in accordance with national local electrical code requirements.**
	**Earth Ground: Functional earth connection. NOTE: This connection shall be bonded to Protective Earth at the source of supply in accordance with national and local electrical code requirements.**
	**Chassis Ground: Identifies a connection to the chassis or frame of the equipment shall be bonded to Protective Earth at the source of supply in accordance with national and local electrical code requirements.**
continued	

Symbol	Description
	The Factory Mutual® Approval mark means the equipment has been rigorously tested and certified to be reliable.
	The Canadian Standards mark means the equipment has been tested and meets applicable standards for safety and/or performance.
	The Ex mark means the equipment complies with the requirements of the European standards that are harmonised with the 94/9/EC Directive (ATEX Directive, named after the French "ATmosphere EXplosible").

1 Introduction

1.1 Overview

This section is an introduction to the physical and functional characteristics Honeywell's family of ST 800 SmartLine Pressure Transmitters.

1.2 Features and Options

The ST 800 SmartLine Pressure Transmitter is available in a variety of models for measuring Differential Pressure (DP), Gauge Pressure (GP), and Absolute Pressure (AP). Table 1 lists the protocols, human interface (HMI), materials, approvals, and mounting bracket options for the ST 800.

Table 1 – Features and Options

Feature/Option	Standard/Available Options
Communication Protocols	HART version 7, Digitally Enhanced (DE), Fieldbus
Human-Machine Interface (HMI) Options (Basic and Advanced Display)	Basic and Advanced Digital Display
	Three-button programming (optional)
	Basic display language: English only
	Advanced display languages: English, German, French, Italian, Spanish, Turkish, Chinese and Russian
Calibration	Single, Dual/Triple Cal
Approvals (See Appendix C for details.)	FM, CSA, ATEX, IECEx, SAEx, INMETRO, NEPSI, GOST, MARINE and MID
Mounting Brackets	Angle/flat carbon steel/304 stainless steel, Marine 304 stainless steel, 316 Stainless Steel
Integration Tools	Experion
Configuration	Plugged Impulse Line Detection (PILD)

1.2.1 Physical Characteristics

As shown in Figure 1, the ST 800 is packaged in two major assemblies: the Electronics Housing and the Meter Body. The elements in the Electronic Housing respond to setup commands and execute the software and protocol for the different pressure measurement types. Figure 2 shows the assemblies in the Electronics Housing with available options.

The Meter Body provides connection to a process system. Several physical interface configurations are available, as determined by the mounting and mechanical connections, all of which are described in the "Installation" section of this manual.

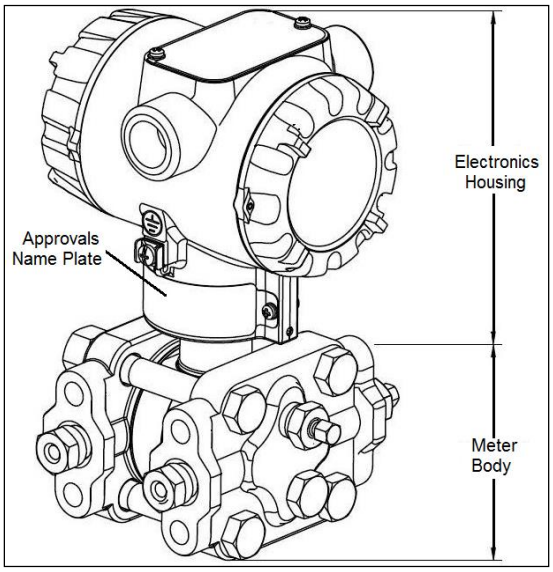

Figure 1 – ST 800 Major Assemblies

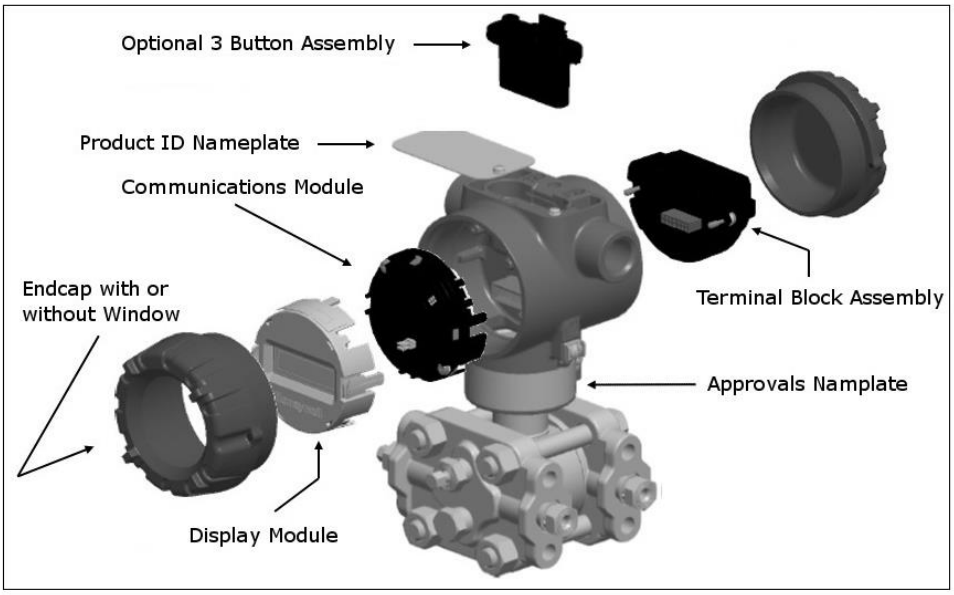

Figure 2 – Electronics Housing Components

1.2.2 Functional Characteristics

Functionally, the Transmitter can measure process pressure and provides a proportional analog 4 to 20 mA output to the measured process variable (PV). Available output communication protocols include Honeywell Digitally Enhanced (DE), HART, and FOUNDATION Fieldbus.

An optional 3-button assembly is available to set up and make adjustments to the Transmitter. In addition, a Honeywell Multi-Communication (MC) Toolkit (not supplied with the Transmitter) can facilitate setup and adjustment procedures. Certain adjustments can be made through an Experion Station or a Universal Station if the Transmitter is digitally integrated with Honeywell's Experion or TPS/TDC 3000 control system.

1.3 ST 800 Transmitter Name Plate

The Transmitter nameplate mounted on the bottom of the electronics housing (see Figure 1) lists its model number, physical configuration, electronics options, accessories, certifications, and manufacturing specialties. Figure 3 is an example of a typical Gauge Pressure (GP) or Atmospheric Pressure (AP) Transmitter name plate. The model number format consists of a Key Number with several table selections. The Differential Pressure (DP), Absolute Pressure (AP), and Gauge Pressure (GP) name plates are essentially the same. However, the DP provides one additional entry (7 vs. 6) in the Meter Body Selections (Table I) to accommodate the static pressure rating.

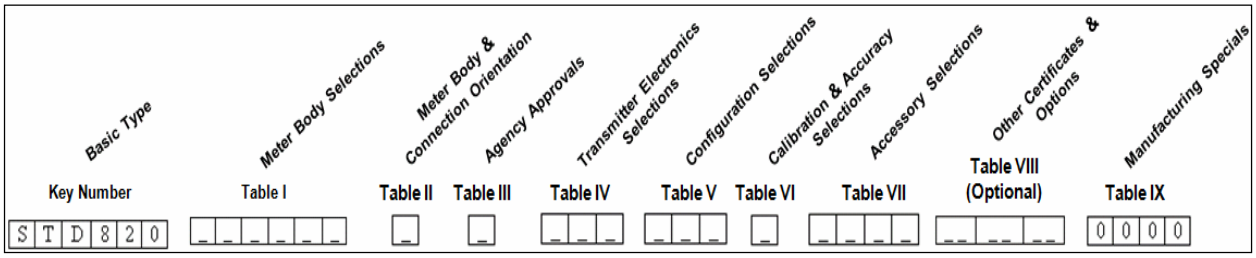

Figure 3 –Typical ST 800 Name Plate

You can readily identify the series and basic Transmitter type from the third and fourth digits in the key number. The letter in the third digit represents one of these basic transmitter types:

- A = Absolute Pressure
- D = Differential Pressure
- F = Flange Mounted
- G = Gauge Pressure
- R = Remote Seals

For a complete selection breakdown, refer to the appropriate Specification and Model Selection Guide provided as a separate document.

1.4 Safety Certification Information

An “approvals” name plate is located on the bottom of the Electronics Assembly; see Figure 1 for exact location. The approvals name plate contains information and service marks that disclose the Transmitter compliance information. Refer to Appendix C of this document for safety certification requirements and details.

1.5 Transmitter Adjustments

Zero and Span adjustments are possible in ST 800 SmartLine Pressure Transmitters with the optional three-button assembly located at the top of the Electronic Housing (see Figure 2).

You can also use the Honeywell MC Toolkit or other third-party hand-held zero to make any adjustments to an ST 800 SmartLine Pressure Transmitter. Alternately, certain adjustments can be made through the Experion or Universal Station, if the Transmitter is digitally integrated with a Honeywell Experion or TPS system.

1.6 Display Options

The ST 800 SmartLine Pressure Transmitter has two display options: Basic and Advanced; see **Error! Reference ource not found.**.

Table 2 – Available Display Characteristics

Basic Display	• Suitable for basic process needs • 360° rotation in 90° Increments • 2 lines, 16 characters • Standard units-of-measurement: Pa, KPa, MPa, KGcm2, TORR, ATM, inH2O, mH2O, bar, mbar, inHg, FTH2O, mmH2O, MMHG, & PSI • Diagnostic messaging • Square root output indications • Supports optional 3-Button configuration and calibration

Advanced Display	• 360° rotation in 90° increments
	• Three (3) configurable screen formats with configurable rotation timing
	  o Large process variable (PV)
	  o PV with bar graph
	  o PV with trend (1-24 hours, configurable)
	• Eight (8) screens with 3-30 seconds rotation timing
	• Standard and custom engineering units
	• Diagnostic alerts and diagnostic messaging
	• Multiple language support:
	  o EN, FR, GE, SP, RU, IT & TK
	  o EN, CH (Kanji), JP
	• Square root output indication
	• Supports 3-button configuration and calibration
	• Supports transmitter messaging, and maintenance mode indications

1.7 Optional 3-Button Assembly

The optional 3-Button Assembly provides the following features and capabilities:

- Increment, decrement, and enter key functions.
- With the menu-driven display:
  - Comprehensive on-screen menu for navigation.
  - Transmitter configuration.
  - Transmitter calibration
  - Display configuration.
  - Set zero and span parameters.

2 Application Design

2.1 Overview

This section discusses the considerations involved with deploying a Honeywell ST 800 SmartLine Pressure Transmitter in a process system. The following areas are covered:

- Safety
- Input and output data
- Reliability
- Environmental limits
- Installation considerations
- Operation and maintenance\
- Repair and replacement

2.2 Safety

2.2.1 Accuracy

The ST 800 SmartLine Pressure Transmitter (Transmitter) measures the gauge, differential, or absolute pressure of a process and reports the measurement to a receiving device.

2.2.2 Diagnostic Messages

Transmitter standard diagnostics are reported in the two basic categories listed in Table 3. Problems detected as critical diagnostics drive the analog output to the programmed burnout level. Problems detected as non-critical diagnostics may affect performance without driving the analog output to the programmed burnout level. Informational messages (not listed in Table 3) report various Transmitter status or setting conditions. The messages listed in Table 3 are specific to the Transmitter, exclusive of those associated with HART and DE protocols. HART and DE diagnostic messages are listed and described in the *ST 800 SmartLine Pressure Transmitter HART/DE Option User Manual*, document number 34-ST-25-38.

Table 3 - ST 800 Standard Diagnostics Messages

Critical Diagnostics (Failure Conditions)	Non-Critical Diagnostics (Warning Conditions)	
Electronic Module DAC Failure	No DAC Compensation	Loop Current Noise
Meter Body NVM Corrupt	No Factory Calibration	AO Out of Range
Config Data Corrupt	PV Out of Range	URV Set Err. Span Config Button
Electronic Module Diag Failure	Fixed Current Mode	LRV Set Err. Zero Config Button
Meter Body Critical Failure	Sensor Over Temperature	PILD Blockage Detected
Sensor Comm Timeout	Meter Body Excess Correct	
	Local Display	
	Low Supply Voltage	
	No DAC Calibration	
	Tamper Alarm	
	Meter Body Unreliable Comm	

2.2.3 Safety Integrity Level (SIL)

The ST800 is intended to achieve sufficient integrity against systematic errors by the manufacturer's design. A Safety Instrumented Function (SIF) designed with this product must not be used at a SIL level higher than the statement, without "prior use" justification by the end user or diverse technology redundancy in the design. Refer to the *ST 800 & ST 700 Safety Manual*, 34-ST-25-37, for additional information.

2.2.4 Plugged Impulse Line detection (PILD)

STA, STD, STG, and STF800 models are offered with a PILD option which provide indication of a plugged impulse line or process connection. When used in conjunction with a basic or advanced display, a non-critical diagnostic indication appears on the integral display. For units without an integral display, an indication can be seen via the host or hand held device when HART Protocol is utilized.

This diagnostic detects clogged or plugged impulse lines. Plugged impulse line detection (PILD) is based on statistical models which continuously compare baseline, or normal, operating noise patterns to check for statistically significant changes when one or both (DP) impulse lines become clogged. See Section 5.6 for details on PILD Option licensing.

3 Installation and Startup

3.1 Installation Site Evaluation

Evaluate the site selected for the ST 800 Transmitter installation with respect to the process system design specifications and Honeywell's published performance characteristics for your particular model. Some parameters that you may want to include in your site evaluation are:

- Environmental Conditions:
  - Ambient Temperature
  - Relative Humidity
- Potential Noise Sources:
  - Radio Frequency Interference (RFI)
  - Electromagnetic Interference (EMI)
- Vibration Sources
  - Pumps
  - Motorized System Devices (e.g., pumps)
  - Valve Cavitation
- Process Parameters
  - Temperature
  - Maximum Pressure Rating

3.2 Honeywell MC Toolkit

In preparation for post-installation processes, refer to the *MC Tookit User Manual*, Document # 34-ST-25-20, for battery conditioning and device operation and maintenance information.

3.3 Display Installation Precautions

Temperature extremes can affect display quality. The display can become unreadable at temperature extremes; however, this is only a temporary condition. The display will again be readable when temperatures return to within operable limits.

The display update rate may increase at cold temperature extremes, but as with readability, normal updating resumes when temperatures are within limits for full operability.

3.4 Mounting ST 800 SmartLine Pressure Transmitters

3.4.1 Summary

Transmitter models, except flush mounts and those with integral flanges, can be attached to a two-inch (50 millimeter) vertical or horizontal pipe using Honeywell's optional angle or flat mounting bracket; alternately you can use your own bracket. Flush-mount models are attached directly to a process pipe or tank by a one-inch weld nipple. Models with integral flanges are supported by the flange connection.

Figure 4 shows typical bracket-mounted and flange-mounted transmitter installations.

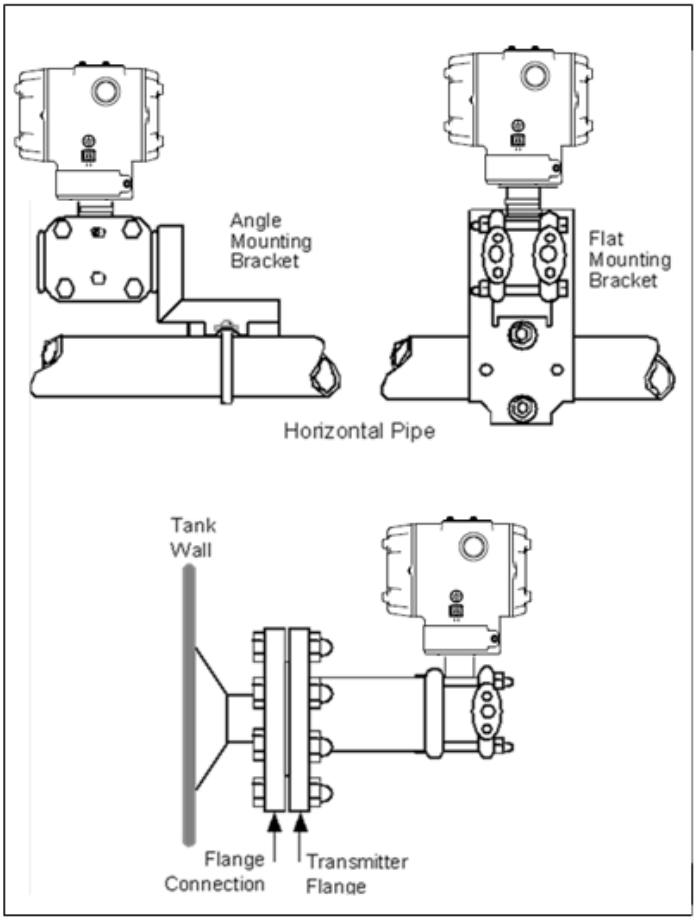

Figure 4 – Typical Bracket Mounted and Flange Mounted Installations

3.4.2 Mounting Dimensions

Refer to Honeywell drawing number 50049930 (Dual Head), 50049931 (In-Line), 50049932 (Flange Mount) 50049933 (Extended Flange), and 50049934 (Remote Seal) for detailed dimensions. Abbreviated overall dimensions are also shown on the Specification Sheets for the transmitter models. This section assumes that the mounting dimensions have already been taken into account and the mounting area can accommodate the Transmitter.

3.4.3 Bracket Mounting Procedure

If you are using an optional bracket, start with Step 1. For an existing bracket, start with Step 2.

1. Refer to Figure 5. Position the bracket on a 2-inch (50.8 mm) horizontal or vertical pipe, and install a "U" bolt around the pipe and through the holes in the bracket. Secure the bracket with the nuts and lock washers provided.

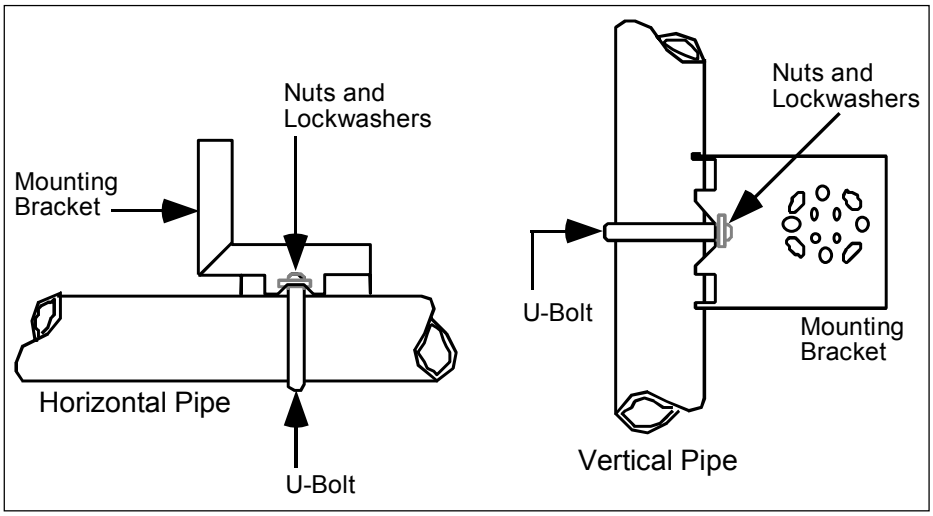

Figure 5 – Angle Mounting Bracket Secured to a Horizontal or Vertical Pipe

2. Align the appropriate mounting holes in the Transmitter with the holes in the bracket. Use the bolts and washers provided to secure the Transmitter to the bracket; see the following variations.

Transmitter Type	Use Hardware
DP with double-ended process heads and/or remote seals	Alternate mounting holes in the ends of the heads
In-line GP and AP (STGxxL and STAxxL)	The smaller "U" bolt provided to attach the meter body to the bracket. See the following example.
Dual-head GP and AP	Mounting holes in the end of the process head.

EXAMPLE: Inline model mounted to an optional angle bracket. See Figure 6**.**

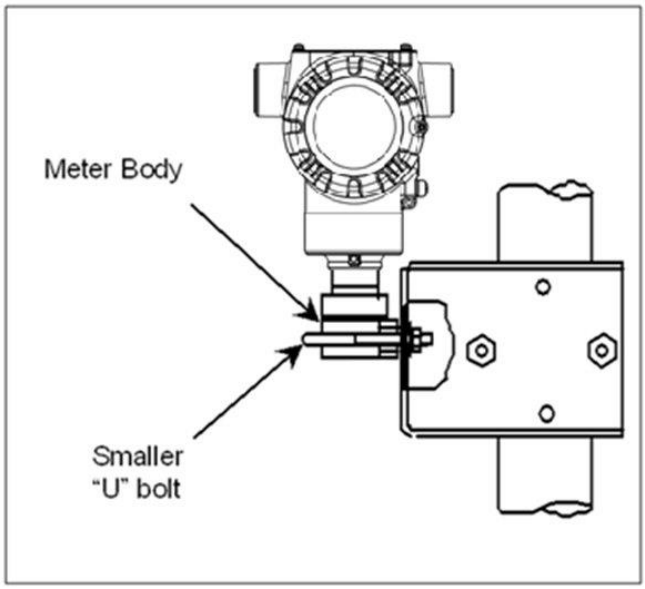

Figure 6 – Inline Model Mounted to an Optional Bracket

3. Loosen the set screw on the outside neck of the Transmitter one (1) full turn.

4. Rotate the Electronics housing a maximum of 180° left or right from the center to the position you require, and tighten the set screw 8.9 to 9.7 pound-inches (1.40 to 1.68 Newton meters), using a 4mm metric socket head wrench. See the following example and Figure 7.

   EXAMPLE: Rotating the Electronics Housing

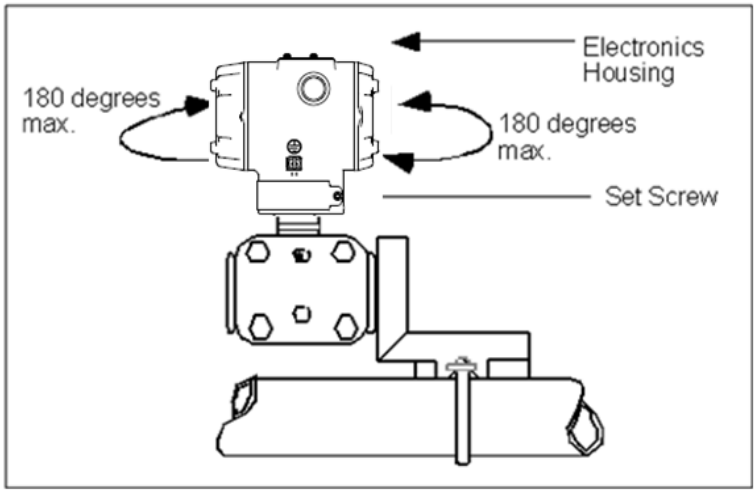

Figure 7 – Rotating the Electronics Housing

The mounting position of absolute pressure models STA822, STA82L, or a draft range model STD810 is critical as the Transmitter spans become smaller.
A maximum zero shift of 2.5 mmHg for an Absolute Transmitter or 1.5 inches of water (inH_2O) for a Draft Range Transmitter can result from a mounting position that is rotated 90° from the vertical. A typical zero-shift of 0.12 mmHg or 0.20 inH_2O can occur for a five (5)-degree rotation from the vertical.

3.4.4 Mounting Transmitters with Small Absolute or Differential Pressure Spans

To minimize positional effects on calibration (zero shift), take the appropriate mounting precautions for the respective Transmitter model. For a model STA822 or STA82L, ensure that the Transmitter is vertical when mounting it. You do this by leveling the Transmitter side-to-side and front-to-back. Figure 8 shows how to level a Transmitter using a spirit level.

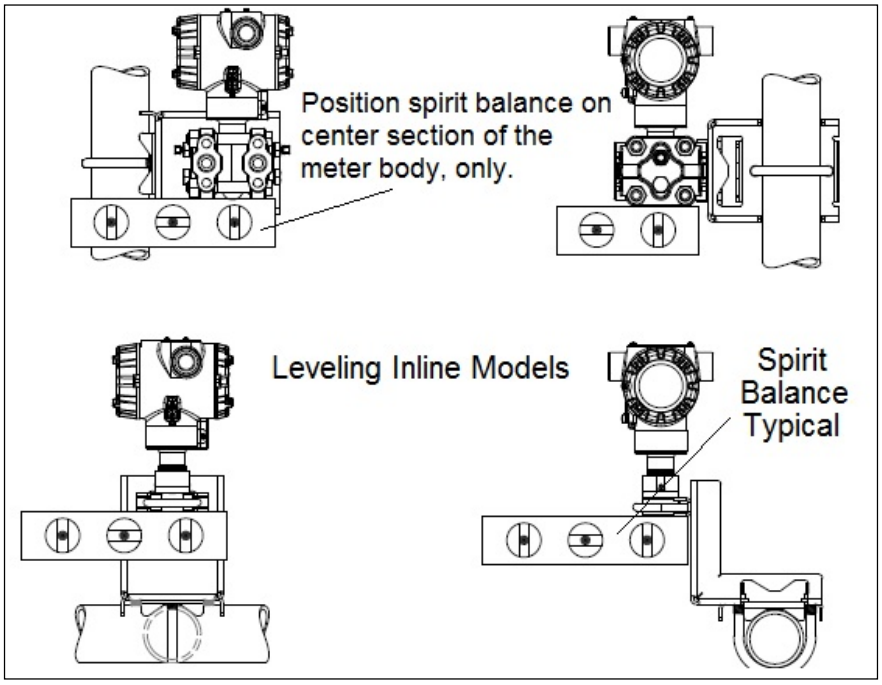

Figure 8 – Using a Spirit Balance to Level a Transmitter

3.4.5 Flange Mounting

Figure 9 shows a typical tank-flange mount installation, with the Transmitter flange mounted to the pipe on the wall of the tank.

On insulated tanks, remove enough insulaiton to accommodate the flange extension.

When flange-mounting to a tank, note the following:

- The End User is responsible for providing a flange gasket and mounting hardware suitable for the Transmitter service conditions.
- To avoid degrading performance in flush-mounted flanged Transmitters, exercise care to ensure that the internal diameter of the flange gasket does not obstruct the sensing diaphragm.
- To prevent performance degradation in extended-mount flanged Transmitters, ensure that sufficient clearance exists in front of the sensing diaphragm body.

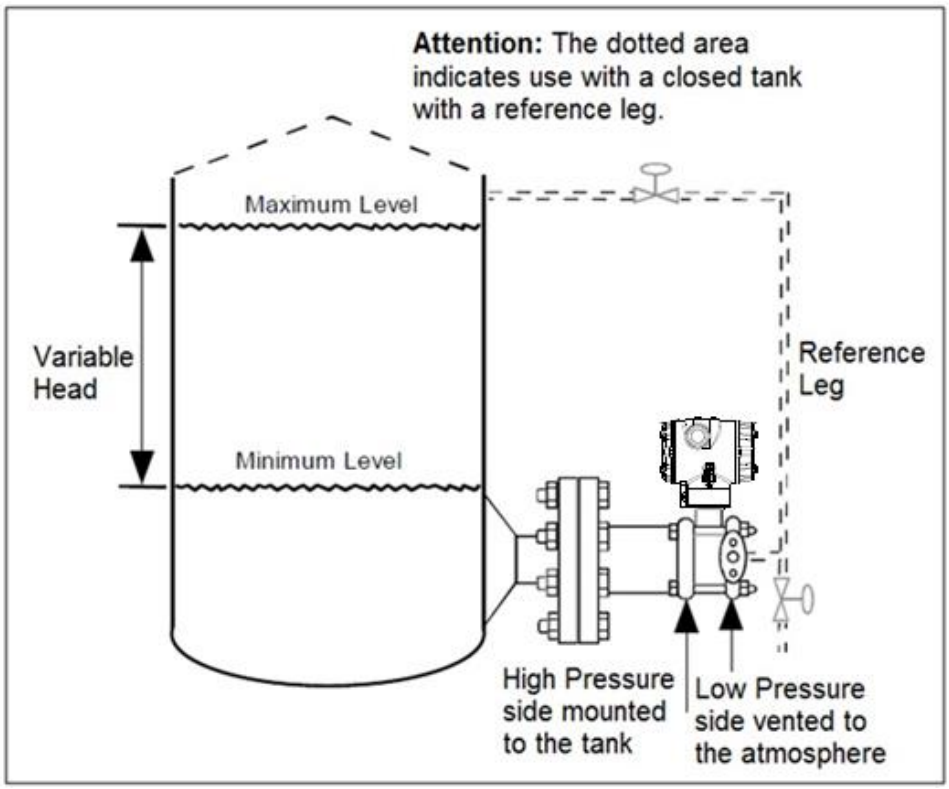

Figure 9 – Tank-Flange Mounted Transmitter

3.4.6 Flush Mounting Procedure

After the Transmitter is mounted, the Electronics Housing can be rotated to the desired position. For insulated tanks, remove enough insulation to accommodate the mounting sleeve and/or the flange extension.

Mount the Transmitter flanges within the limits Table 4 for the fill fluid in the capillary tubes, with a tank at one (1) atmosphere.

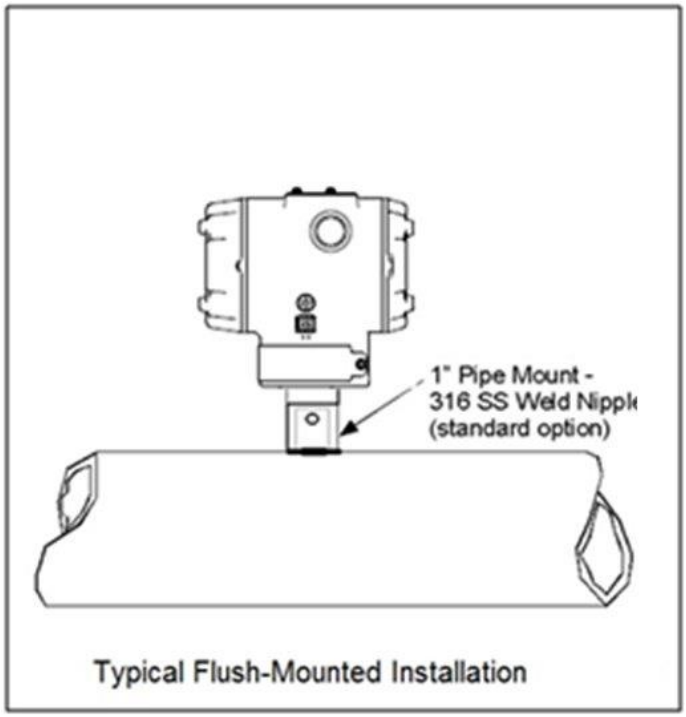

Figure 10 – Typical Flush and Flange Mounted Installations

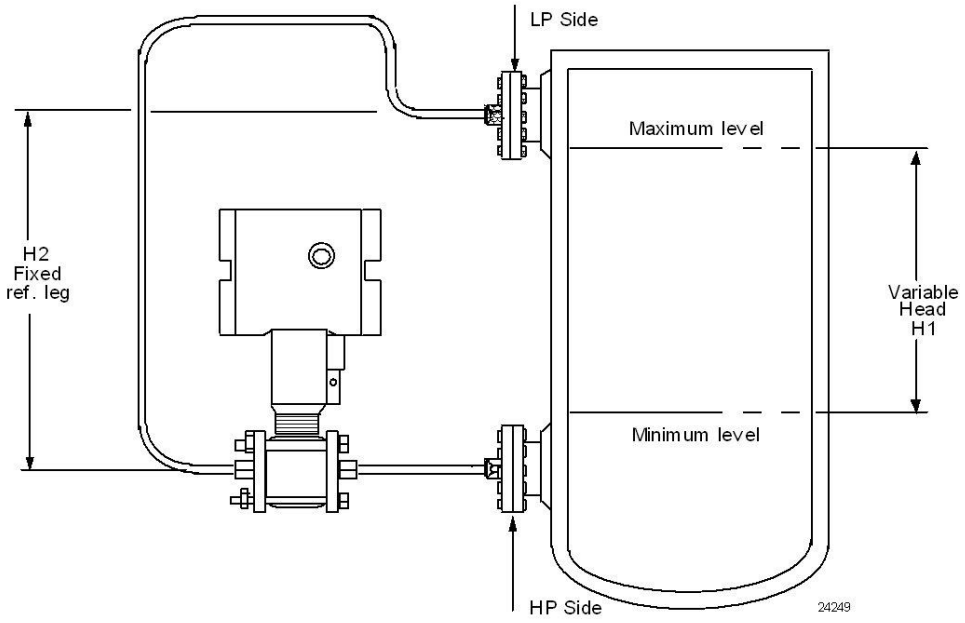
1. Refer to Figure 10 for a representative flush-mounted Transmitter installation. Cut a hole for a one (1) inch standard pipe in the tank or pipe at the Transmitter mounting site.
2. Weld the 1-inch mounting sleeve to the tank wall or to the hole you cut in the pipe.
3. Insert the Transmitter Meter Body into the mounting sleeve, and secure it with the locking bolt.
4. Tighten the bolt to a torque of 4 Nm $\pm$0.3 Nm (4.7 pound-feet $\pm$0.2 pound-feet).

3.4.7 Remote Diaphragm Seal Mounting Information



The combination of tank vacuum and high pressure capillary head effect should not exceed nine (9) psi (300 mmHg) absolute. For insulated tanks, be sure to remove enough insulation to accommodate the flange extension. The end user is responsible for supplying a flange gasket and mounting hardware suitable for the service condition of the Transmitter.

Mount the Transmitter flanges within the limits in for the fill fluid in the capillary tubes, with a tank at one (1) atmosphere.

Table 4 – Flange Mounting Guidelines

Fill Fluid	Mount the Flange…
Silicone 200 Oil	≤22 feet (6.7 meters) below the Transmitter
Chlorotrifluorethylene (CTFE)	≤11 feet (3.4 meters) below the Transmitter

Refer to Figure 11 for a representative remote diaphragm seal installation. Mount the Transmitter at a remote distance determined by the length of the capillary tubing.

NOTE: Lower flange seal should not be mounted over 22 feet below or above the transmitter for silicone fill fluid (11 feet for CTFE fill fluid) with tank at one atmosphere. The combination of tank vacuum and high pressure capillary head effect should not exceed 9 psi vacuum (300 mmHg absolute).

Figure 11 – Representative Remote Diaphragm Seal Transmitter Installation

Depending on Transmitter model, connect the remote seal to the tank according to

Table 5

Table 5 – Remote Diaphragm Mounting Details

Transmitter Model	Connect the Remote Seal on ….	
	Variable Head	Fixed or Constant Head
STR82D	Transmitter High Pressure (HP) Side to tank wall lower flange mounting.	Transmitter Low Pressure (LP) side to tank wall upper flange.
STR83D	Transmitter Low Pressure (LP) Side to tank wall lower flange mounting.	Transmitter Low Pressure (LP) side to tank wall upper flange. **OR** High Pressure (HP) side to tank wall upper flange

3.5 Piping the ST 800 Transmitter

3.5.1 Piping Arrangements

Piping arrangements vary depending upon process measurement requirements and the Transmitter model. For example, a differential pressure transmitter comes with double-ended process heads with ¼-inch NPT connections, which can be modified to accept ½-inch NPT through optional flange adapters. Gauge pressure transmitters are available with various connections for direct mounting to a process pipe.

A ½-inch, schedule 80, steel pipe is commonly used for Transmitter integration into a process system. Many piping arrangements use a three-valve manifold to connect the process piping to the Transmitter. A manifold makes it easy to install and remove or re-zero a Transmitter without interrupting the process. A manifold also accommodates the installation of blow-down valves to clear debris from pressure lines. Figure 12 represents a typical piping arrangement using a three-valve manifold and blow-down lines for a differential pressure transmitter being used to measure flow.

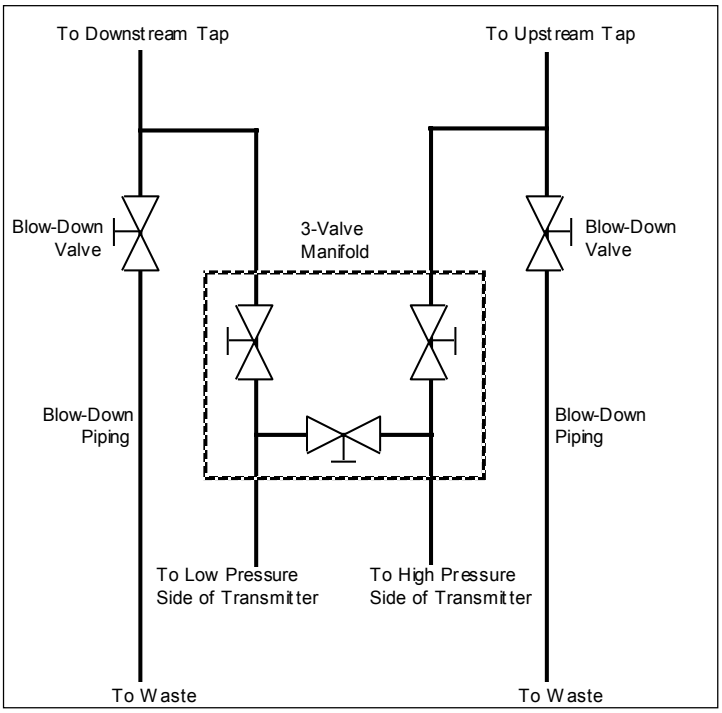


Figure 12 – Typical 3-Valve Manifold with Blow-Down Piping

3.5.2 Suggestions for Transmitter Location

Suggests connections based on what is being processed by the system.

Table 6 – Suggested Connection Locations

Process	Suggested Location	Description
Gases	Above the gas line.	The condensate drains away from the Transmitter.
Liquids	Below but near the elevation of the process connection.	This minimizes that static head effect of the condensate.
	Level with or above the process connection.	This requires a siphon to protect. the Transmitter from process steam. The siphon retains water as a *fill fluid*.

1. For liquid or steam, the piping should slope a minimum of 25.4 mm (1 inch) per 305 mm (1 foot).
2. Slope the piping down toward the Transmitter if it is below the process connection to allow the bubbles to rise back into the piping through the liquid.
3. If the transmitter is located above the process connection, the piping should rise vertically above the Transmitter. In this case, slope down toward the flow line with a vent valve at the high point.
4. For gas measurement, use a condensate leg and drain at the low point (freeze protection may be required here).

ATTENTION Care must be taken when installing transmitters on hot processes. The operating temperature limits for the device (as outlined in Table 5) must not be exceeded. Impulse piping may be used to reduce the temperature of the process that comes into contact with the transmitter meter body. As a general rule there is a 56 °C drop (100 °F) in the temperature of the process for every foot of ½ inch uninsulated piping.

3.5.3 General Piping Guidelines

- When measuring fluids that contain suspended solids, install permanent valves at regular intervals to blow-down piping.
- Blow-down all lines on new installations with compressed air or steam, and flush them with process fluids (where possible) before connecting these lines to the Transmitter Meter Body.
- Verify that the valves in the blow-down lines are closed tightly after the initial blow-down procedure and each maintenance procedure thereafter.

3.5.4 Procedure to Install Flange Adapters

The following procedure provides the steps for removing and replacing an optional flange adapter on the process head.

This procedure does not require that the Meter Body be removed from the Electronics Housing. If flange adapters are being replaced with parts from other kits (for example, process heads), follow the procedures for the kits and incorporate the following procedure.

NOTE: The threaded hole in each Flange Adapter is offset from center. To ensure proper orientation for re-assembly, note the orientation of the offset relative to each Process Head **before removing any adapter**.

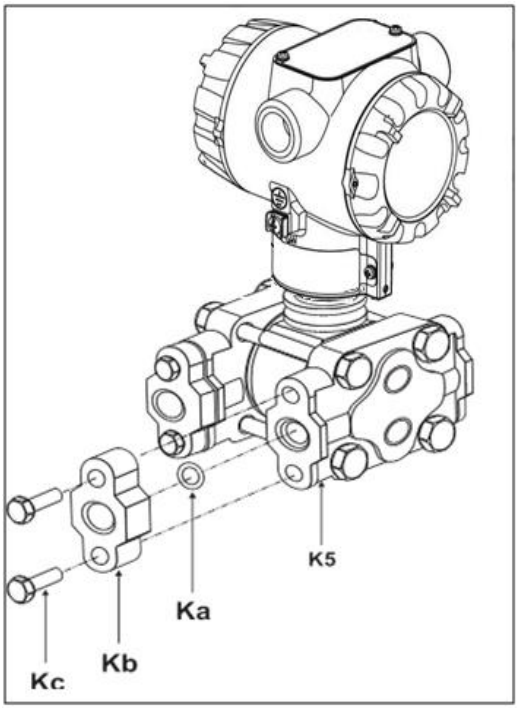

Figure 13 – Flange Adapter Removal and Replacement

Refer to the instructions included with the kit for removal and replacement procedures.

3.6 Wiring a Transmitter

3.6.1 Overview

The transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range shown in Figure 14.

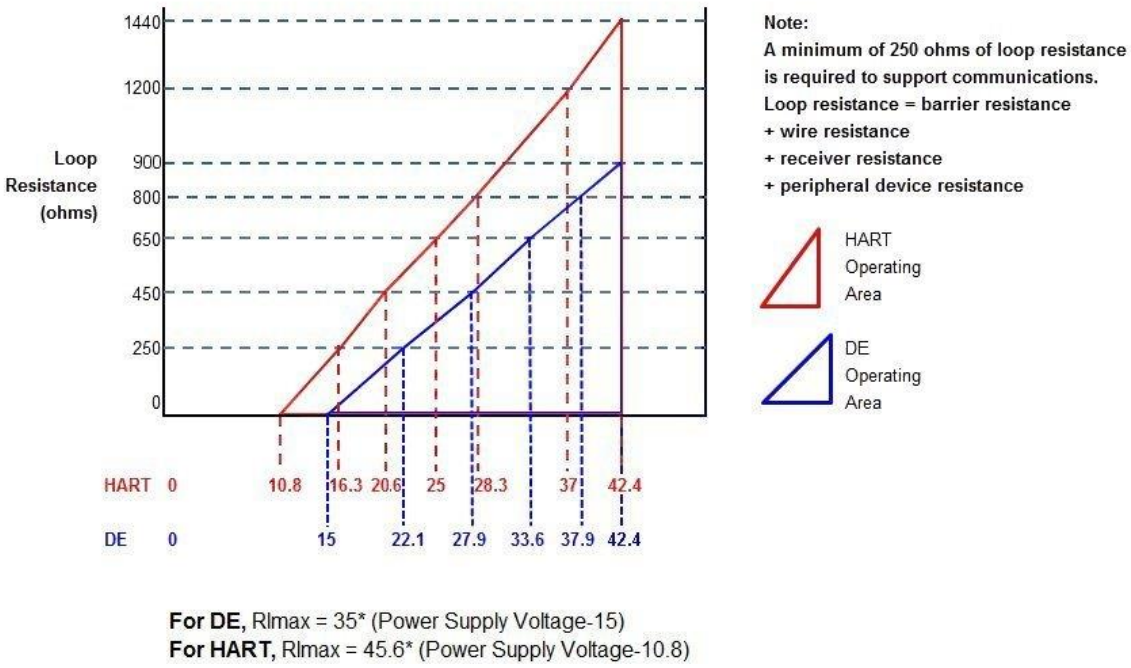

Figure 14 – Transmitter Operating Ranges

Loop wiring is connected to the Transmitter by simply attaching the positive (+) and negative (–) loop wires to the positive (+) and negative (–) terminals on the Transmitter terminal block in the Electronics Housing shown in Figure 15.

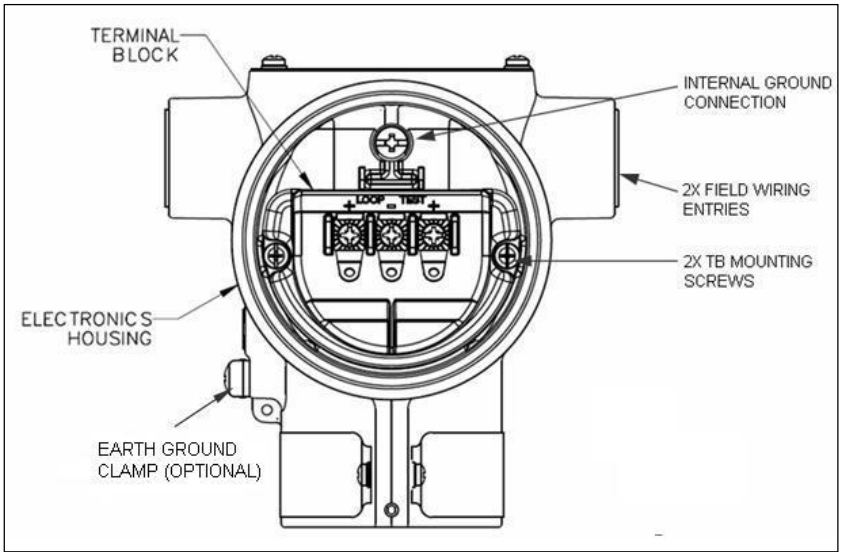

Figure 15 – Transmitter 3-Screw Terminal Board and Grounding Screw

As shown in Figure 15, each Transmitter has an internal terminal to connect it to earth ground. Optionally, a ground terminal can be added to the outside of the Electronics Housing. While it is not necessary to ground the Transmitter for proper operation, doing so tends to minimize the possible effects of noise on the output signal and affords protection against lightning and static discharge. An optional lightning terminal block can be installed in place of the non-lightning terminal block for Transmitters that will be installed in an area that is highly susceptible to lightning strikes.

Wiring must comply with local codes, regulations and ordinances. Grounding may be required to meet various approval body certification, for example CE conformity. Refer to Appendix A of this document for details.

Note: The right hand terminal is for loop test and not applicable for Fieldbus option.

The Transmitter is designed to operate in a two-wire power/current loop with loop resistance and power supply voltage within the operating range; see Figure 14. With optional lightning protection and/or a remote meter, the voltage drop for these options must be added to the basic 10.8-volt supply requirements to determine the required Transmitter voltage (V_{XMTR}) and maximum loop resistance ($R_{LOOP\ MAX}$). Additional consideration is required when selecting intrinsic safety barriers to ensure that they will supply at least minimum Transmitter voltage ($V_{XMTR\ MIN}$), including the required 250 ohms of resistance (typically within the barriers) needed for digital communications.

Transmitter loop parameters are as follows:
$R_{LOOP\ MAX}$ = maximum loop resistance (barriers plus wiring) that will allow proper Transmitter operation and is calculated as $R_{LOOP\ MAX} = (V_{SUPPLY\ MIN} - V_{XMTR\ MIN}) \div 21.8$ mA.

In this calculation:

$V_{XMTR\ MIN} = 10.8\ V + V_{LP} + V_{SM}$

$V_{SM} = 2.3$ V, remote meter

Note that V_{SM} should only be considered if a remote meter will be connected to the transmitter.

The positive and negative loop wires are connected to the positive (+) and negative (–) terminals on the terminal block in the Transmitter Electronics Housing.

Barriers can be installed per Honeywell's instructions for Transmitters to be used in intrinsically safe applications.

3.6.2 Digital System Integration Information

Transmitters that are to be digitally integrated to Honeywell's Total Plant Solution (TPS) system will be connected to the Pressure Transmitter Interface Module in the Process Manager, Advanced Process Manager or High Performance Process Manager through a Field Termination Assembly. Details about the TPS system connections are given in the *PM/APM SmartLine Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

If you are digitally integrating a Transmitter in an Allen Bradley Programmable Logic Controller (PLC) process system, the same Field Terminal Assembly (FTA) and wiring procedures used with Honeywell's TPS system are also used with the Allen-Bradley 1771 and 1746 platforms.

3.6.3 Wiring Variations

The above procedures are used to connect power to a Transmitter. For loop wiring and external wiring, detailed drawings are provided for Transmitter installation in non-intrinsically safe areas and for intrinsically safe loops in hazardous area locations.
If you are using the Transmitter with Honeywell's TPS system, see *PM/APM Smartline Transmitter Integration Manual*, PM12-410, which is part of the TDC 3000^X system bookset.

3.6.4 Wiring Procedure

1. See Figure 15, above, for parts locations. Loosen the end cap lock using a 1.5 mm Allen wrench.
2. Remove the end cap cover from the terminal block end of the Electronics Housing.
3. Feed loop power leads through one end of the conduit entrances on either side of the Electronics Housing. The Transmitter accepts up to 16 AWG wire.
4. Plug the unused conduit entrance with a conduit plug appropriate for the environment.
5. Connect the positive loop power lead to the positive (+) terminal and the negative loop power lead to the negative (-) terminal. Note that the Transmitter is not polarity-sensitive.
6. Replace the end cap, and secure it in place.

3.6.5 Lightning Protection

If your Transmitter includes the optional lightning protection, connect a wire from the Earth Ground Clamp (see Figure 15) to Earth Ground to make the protection effective. Use a size 8 AWG or ($8.37mm^2$) bare or green covered wire for this connection.

3.6.6 Supply Voltage Limiting Requirements

If your Transmitter complies with the ATEX 4 directive for self-declared approval per 94/9EC, the power supply has to include a voltage-limiting device. Voltage must be limited such that it does not exceed 42 V DC. Consult the process design system documentation for specifics.

3.6.7 Process Sealing

The ST 800 SmartLine Pressure Transmitter is CSA-certified as a Dual Seal device in accordance with ANSI/ISA–12.27.01–2003, "Requirements for Process Sealing Between Electrical Systems and Flammable, or Combustible Process Fluids."

3.6.8 Explosion-Proof Conduit Seal

When installed as explosion proof in a Division 1 Hazardous Location, keep covers tight while the Transmitter is energized. Disconnect power to the Transmitter in the non-hazardous area prior to removing end caps for service.

When installed as non-incendive equipment in a Division 2 hazardous location, disconnect power to the Transmitter in the non-hazardous area, or determine that the location is non-hazardous before disconnecting or connecting the Transmitter wires.

Transmitters installed as explosion proof in Class I, Division 1, Group A Hazardous (classified) locations in accordance with ANSI/NFPA 70, the US National Electrical Code, with 1/2 inch conduit do not require an explosion-proof seal for installation. If 3/4 inch conduit is used, a LISTED explosion proof seal to be installed in the conduit, within 18 inches (457.2 mm) of the transmitter.

3.7 Startup

3.7.1 Overview

This section identifies typical start up tasks associated with several generic pressure measurement applications. It also includes the procedure for running an optional analog output check.

3.7.2 Startup Tasks

After completing the installation and configuration tasks for a Transmitter, you are ready to start up the process loop. Startup usually includes:

- Checking zero input
- Reading inputs and outputs
- Applying process pressure to the transmitter.

You can also run an optional output check to *wring out* an analog loop and check out individual Process Variable (PV) outputs in Digitally Enhanced (DE) mode before startup.

The actual steps in a startup procedure vary based on the type of Transmitter and the measurement application. In general, the procedures in this section are based on using Honeywell MC Toolkit to check the Transmitter input and output under static process conditions, and make adjustments as required initiating full operation with the running process. Note that like checks can be made using the optional three-button assembly, if your Transmitter is so equipped. Operation with the three-button assembly is discussed in the "Operation" section of this manual.

3.7.3 Output Check Procedures

The Output Check comprises the following procedures:

- The Loop Test procedure checks for continuity and the condition of components in the output current loop.
- The Trim DAC Current procedure calibrates the output of the Digital-to-Analog converter for minimum (0%) and maximum (100%) values of 4 mA and 20 mA, respectively. This procedure is used for Transmitters operating online in analog mode to ensure proper operation with associated circuit components (for example, wiring, power supply,…, control equipment). Precision test equipment (an ammeter or a voltmeter in parallel with precision resistor) is required for the Trim DAC Current procedure.
- The Apply Values procedure uses actual Process Variable (PV) input levels for calibrating the range of a Transmitter. To measure a liquid level for example, a sight-glass can be used to determine the minimum (0%) and maximum (100%) level in a vessel. The PV is carefully adjusted to stable minimum and maximum levels, and the Lower Range Limit Value (LRV) and Upper Range Limit Value (URV) are then set by commands from the MC Toolkit.

The Transmitter does not measure the given PV input or update the PV output while it operates in the Output mode.

3.7.4 Constant Current Source Mode Procedure

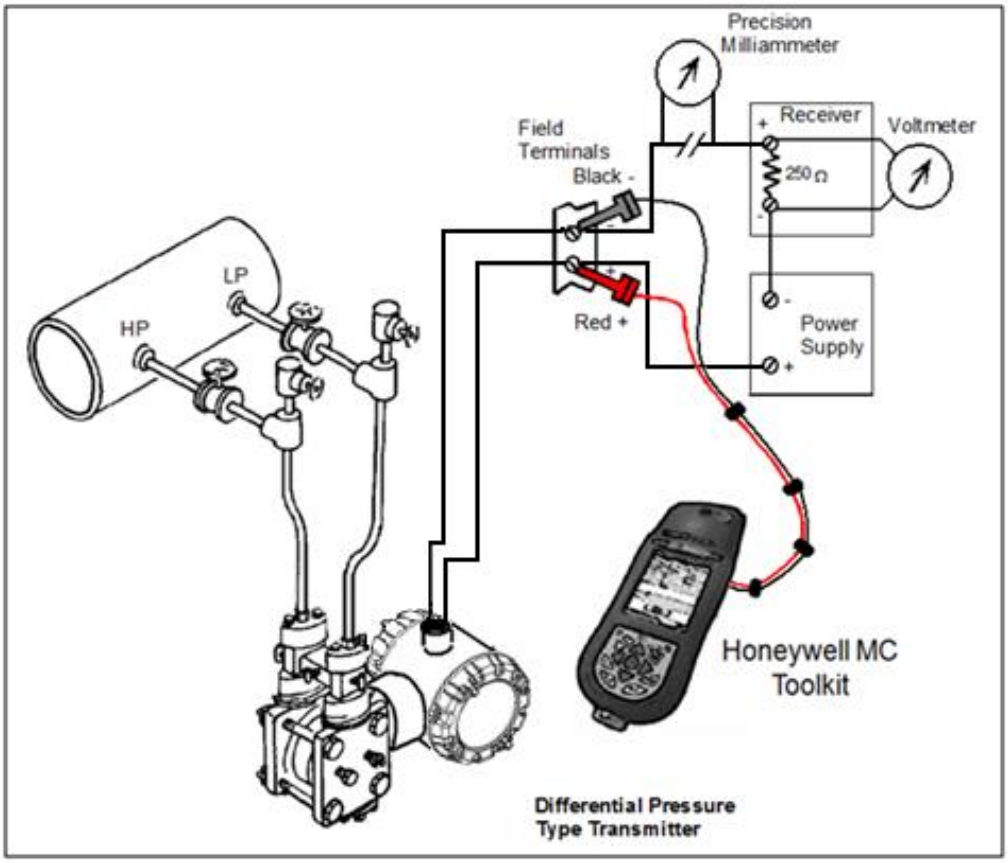

Figure 16 – Current Loop Test Connections

1. Refer to Figure 16 for test connections. Verify the integrity of electrical components in the output current loop.
2. Establish communication with the Transmitter. For these procedures, the values of components in the current loop are not critical if they support reliable communication between the Transmitter and the Toolkit.
3. On the Toolkit, display the **Output Calibration** box.
4. In the Output Calibration box, select the **Loop Test** button; the **LOOP TEST** box will be displayed.
5. Select the desired constant-level Output: 0 %, 100 %, or Other (any between 0 % - 100 %).
6. Select the Set button. A box will be displayed asking **Are you sure you want to place the transmitter in output mode?**

   With the Transmitter in Analog mode, you can observe the output on an externally-connected meter or on a local meter. In DE mode, you can observe the output on the local meter or on the Toolkit Monitor display.
7. Select the **Yes** button. Observe the output current at the percentage you selected in Step 5.
8. To view the monitor display, navigate back from the **LOOP TEST** display, and select the **MONITOR** display. A **Confirm** popup will be displayed.
9. Select **Yes** to continue. This concludes the Startup procedure.

4 Operation

4.1 Overview

This section provides the information and processes involved for both Digitally Enhanced (DE) and HART operation using the 3-button option.

4.2 Three-Button Operation

The ST 800 optional three-button interface provides a user interface and operation capability without opening the transmitter. Figure 17 shows the location of the three-button option and the labels for each button.

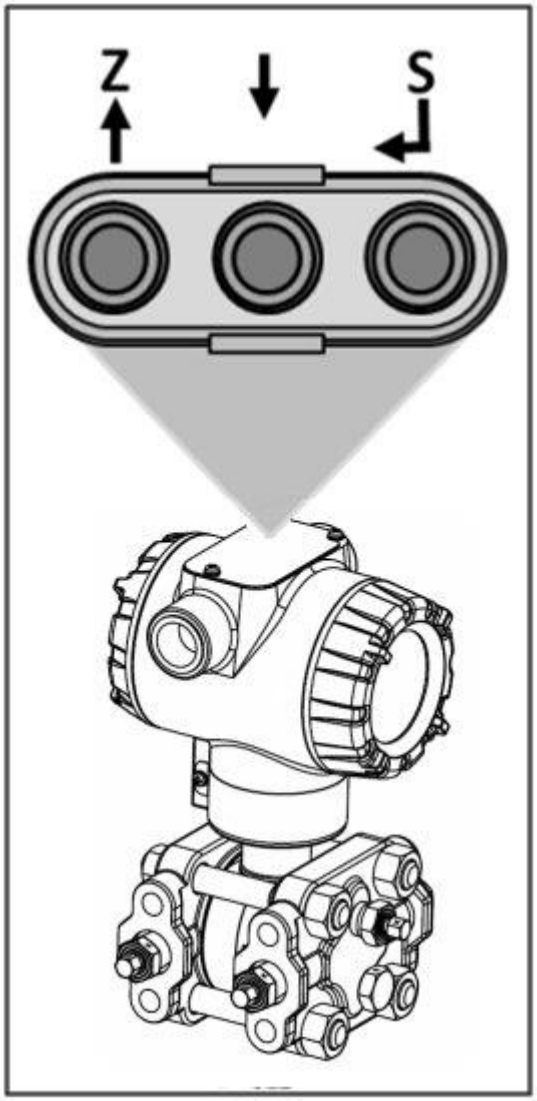

Figure 17 – Three-Button Option

Table 7 – Three-Button Option Functions

Physical Button	Basic Display	Advanced Display	Action
Left ↑	Increment Previous Menu Item	Increment Move cursor Up	Scroll to previous menu item in an active list. Scroll through alphanumeric list to desired character (ex. for entering Tag names or numeric values)
Center ↓	Decrement Next Menu Item	Decrement Move cursor Down	Scroll to next menu item in an active list. Scroll through alphanumeric list to desired character (ex. for entering Tag names or numeric values)
Right ↵	Select displayed menu item for activation or editing	Enter	Call up the Main Menu. Call up a lower-level menu. Select an item for data entry. Confirm a data entry operation Activate the service associated with a selected menu item.

4.2.1 Menu Navigation

The behavior of the buttons is the same for both the Basic and Advanced Displays. The user must press ↵ button to call up the Main Menu. To exit the Main Menu and return to the PV display screen, select <**EXIT**>.

When on a lower level menu, return to the menu above by selecting <Return>. Alternately, the (up) and (down) buttons can be pressed simultaneously to return to the menu above. When on the highest level menu, or when using the basic display menu, pressing the (up) and (down) buttons simultaneously will exit the menu and return to the PV display.

Use the ↑ and ↓ buttons to scroll through the list of menu items. Press the ↵ button to select an item for data entry or activation. When an item is selected for data entry or activation, the cursor will jump to the lower line of the LCD (Basic Display) or call up a pop-up window (Advanced Display) to allow editing of the value. No action is taken against a menu item until the ↵ button is pressed.

If a user presses the ↵ button to begin a data entry operation, they must press another button within 10 seconds or the transmitter firmware will assume that the user wants to abort the operation or has walked away from the transmitter. After 10 seconds with no action, the data entry will time out and the original value of the parameter will be preserved.

If no button presses occur within 60 seconds, menu access will time out and the transmitter will exit the menu and return to the PV display.

4.2.2 Data Entry

Data entry is performed from left to right. Select a character / digit by pressing ↑ or ↓ buttons, and then press ↵ to advance to the next character position to the right. Select the cross-hatch character ▒ to terminate the entry or if the final character is already a space character, just press ↵ again.

All numeric entries are clamped at the low or high limit if needed. You can determine the low and high limit for a parameter by selecting either the ▲ or ▼ character while the cursor is positioned over the left-most digit and press ↵ button. The Display will show the selected limit.

Table 8 – Three-Button Data Entry

Screen Symbol	Numeric data entry	Text entry
▲	Display the high limit for this parameter. This symbol only appears in the left-most position of the data entry field.	Not Available
▼	Display the low limit for this parameter. This symbol only appears in the left-most position of the data entry field.	Not Available
▒	Terminate the numeric entry	Terminate the text entry
0 thru 9, Minus, Decimal	These characters are used to enter numeric values. The minus sign only appears in the left-most digit.	These characters can be used to create custom tags and unit labels
A thru Z, 0 thru 9 special symbols	Not Available	These characters can be used to create custom tags and unit labels

4.2.3 Editing a Numeric Value

Editing a Numeric Value
Editing of a numeric value is a digit-by-digit process, starting with the left-most digit.

1. Press ↵ to begin the edit process.
2. The Basic Display will show the current value of the item on the lower line, left justified. The Advanced Display will show the current value of the item in a pop-up window in the middle of the screen
3. Press the ↑ or ↓ buttons to select the desired digit, and then press ↵ to advance to the next digit to the right.
4. After the last digit has been entered, press ↵ one more time to write the new value to the transmitter.

4.2.4 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g., Screen Format, Display Units, etc.).

1. Press ↵ to begin the edit process.
    a. The Basic Display will show the current setting of the item on the lower line, left justified.
    b. The Advanced Display will show the current setting of the item in a pop-up window.
2. Press the ↑ or ↓ buttons to scroll through the list of choices.
3. Press ↵ to make your selection. The new selection will be stored in the transmitter and will be displayed on the lower line, right justified.

4.2.5 The Advanced Display Menus

The Advanced Display menus are organized into three levels, as shown by Table 9. There is a <**Return**> menu item at each level that allows the user to return to the previous level.

Table 9 – Advanced Display Main Menu Structure

Level 1	Level 2	Level 3
<Exit>	n/a	n/a
Diagnostics	Critical Non-Critical PILD (Optional)*	For details go to the Diagnostics Menu table
Display Setup	LCD Contrast Common Setup Screen 1 Screen 2 … Screen 8	For details go to the Display Setup Menu table. Note that the Advanced Display supports the configuration of up to 8 different screens.
Calibration	Set Time Stamp Zero Correct LRV Correct URV Correct Reset Corrects DAC Trim Loop Test Factory Cal	For details go to the Calibration Menu table.
Transmtr Setup	Parameters Enter LRV Enter URV Set LRV Set URV Install date PILD (Optional)*	For details go to the Transmitter Setup Menu table.
Information	Display Elec Module Meterbody	For details go to the Information Menu table.

*This feature is available only if ST 800 Sensor supports PILD feature.

Table 10 – Diagnostics Menu

All Diagnostics menu items are Read Only.

<Return> Return to the Level 1 menu			
Critical	<Return>		
	Active Diags	# #	Description
	Meterbody	OK FAULT	FAULT: There is a problem with the Meterbody
	Elec. Module	OK FAULT	FAULT: There is a problem with the Electronics Module (HART, DE, or FF)
	Meterbody Comm	OK FAULT	FAULT: There is a problem with the interface between the Meterbody and the Electronics Module.
Non-Critical	<Return>		
	Active Diags	# #	Shows the number of Non-Critical Diagnostics that are currently active
	Analog Out mode	Normal FIXED OUTPUT	Normal indicates that the Loop Output reflects the current value of the PV. FIXED OUTPUT indicates that the Loop Output of the transmitter is manually set a fixed value, probably due to a DAC Trim or Loop Test operation that is currently in progress.
	Zero Correct	OK EXCESSIVE	EXCESSIVE: Input applied exceeds 5% of expected value (as defined by LRV).
	Span Correct	OK EXCESSIVE	EXCESSIVE: Input applied exceeds 5% of expected value (as defined by URV).
	Supply Voltage	OK LOW HIGH	LOW: Supply voltage is below the low specification limit HIGH: Supply voltage is above the high specification limit.
	Primary PV	OK OVERLOAD	OVERLOAD: Input pressure is greater than 200% URL (DP) or 150% URL (GP, AP)
	Meterbody Temp	OK OVER TEMP	OVERTEMP: Meterbody temperature is greater than 125 °C
	Elec Module Temp	OK OVER TEMP	OVERTEMP: Electronics temperature is greater than 85 °C
	Meterbody Comm	OK SUSPECT	SUSPECT: The interface between the Meterbody and the Electronics Module is experiencing intermittent communication failures.
	Factory Cal	OK NO FACTORY CAL	The transmitter has not been calibrated by the factory.
	DAC Temp Comp	OK NO COMPENSATION	The DAC has not been compensated for temperature effects. This is a factory operation.

Non-Critical (continued)	PILD Block OS (Optional)	OK BLOCKED	It is applicable for DP Transmitter only. *OK*: Blockage is not detected *BLOCKED*: Blockage is detected at one side of impulse line. See **Note** below this table.
	PILD Block BS (Optional)	OK BLOCKED	It is applicable for DP Transmitter only. *OK*: Blockage is not detected *BLOCKED*: Blockage is detected at Both sides of impulse line. See **Note** below this table.
	PILD Blockage (Optional)	OK BLOCKED	It is applicable for AP/GP Transmitter only. *OK*: Blockage is not detected *BLOCKED*: Blockage is detected at measurement side. See **Note** below this table.
PILD (Optional)	<Return>		
	Current Mode	Training Monitoring	Displays the current status of PILD algorithm i.e either Training mode or Monitoring Mode. See **Note** below this table
	PILD Factor	PILD factor for blockage prediction 0.0 to 1.0	Displays the current PILD factor value. See the Note below in table
	Training Result	SUCCESS FAILED	Displays the training mode result.

NOTE: This diagnostics message or PILD sub menu will be visible only if PILD feature is supported by the sensor and user enabled in the PILD option in the transmitter.

Table 11 – Display Setup Menus

<Return> Return to the Level 1 menu				
LCD Contrast	<Return>			
	Set Contrast	# #	Adjust the LCD contrast level. Range from 0 to 9. Default: 5	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
Common Setup	<Return>			
	Set Password	####	Enter Display configuration password. Default: 0000. This value disables the password. All other values enable the password. When enabled, a prompt to enter the password is presented only on the first parameter successfully accessed to change after entering the menu.	
	Language	• English, French, German, Italian, Spanish, Russian & Turkish • English, Chinese, Japanese	Select the language for the Display. Default: English	Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter
	Rotation Time	# #	Time duration, in seconds, that each configured screen is shown before moving to the next screen. Range: 3 to 30 seconds Default: 10 seconds	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Units	atm bar ftH2O @ 68°F gf /cm2 inH2O @ 39°F inH2O @ 60°F inH2O @ 68°F inH2O @ 0°C kgf/cm2 kPa mbar mmH2O @ 4°C mmH2O @ 68° F mmHg @ 0 C MPa Pa psi Torr	This selection determines the units of the values shown on the following menu items: • Enter LRV • Enter URV • Set LRV • Set URV • Zero Correct (Calib. menu) • LRV Correct(Calib. menu) • URV Correct(Calib. menu) • LRL (Meterbody Info. menu) • URL (Meterbody Info. menu) For calibration, this parameter allows the user to match the value displayed on the menus to	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter

			the units supported by the user's calibration equipment.			
Screens 1 thru 8	<Return>					
	Screen Format	None PV PV & Bar Graph PV & Trend	Select the Screen format from the list.			Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter
	Trend Duration	##	Select the amount of historic data visible on the Trend screen. Range: 1 to 24 hours. Applies to the "PV & Trend" format only			Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	PV Selection	DP, AP, or GP Pressure Meterbody Temp Loop Output Percent Output Static Press PILD Factor (Optional) See Note 3 below	Select the Process Variable (PV) that will be shown this screen.			Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter
	PV Scaling	None	Display the PV in the default units associated with the PV Selection. Default units: • Pressure:inH2O@ 39ºF • Meterbody Temp: ºC • Loop Output: mA • Percent Output: % • Static Pressure: psi			Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter Custom Units: ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next char
		Convert Units (Default PV scaling selection)	Convert the displayed PV to any pressure unit listed under Display Units			
		Linear See Note 1 below	Display Units	Custom	Units up to 8 char	
		Square Root (only available for DP transmitters) See Note 2 below.	Display Units	%		
				Custom Units	up to 8 char	
				gal/min		
				gal/h		
				L/m		
				L/h		

Screens 1 thru 8 (continued)	Display Units	atm , bar, ftHO @ 68ºF gf / cm2 inH2O @ 39ºF inH2O @ 60ºF inH2O @ 68ºF inHg @ 0ºC kgf/cm2, kPa, mbar mmH2O @ 4ºC mmH2O @ 68ºF mmHg @ 0ºC MPa, Pa, psi, Torr, ºC, ºF, ºR, K	Select the Display Units for the selected PV.	Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter
	Custom Units	□□□□□□□□	Enter custom text using any alphanumeric value up to 8 characters long. Custom Units is only available if PV Scaling is set to Linear or Square Root.	Custom Units: ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character
	Decimal	None X.X X.XX X.XXX	Select the decimal resolution for the PV.	Press ↵ to enter menu selection ↑ and ↓ to select from list. ↵ to enter
	Disp Low Limit	#########	Enter the lower limit shown on the Bar Graph or Trend screen	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Disp High Limit	#########	Enter the upper limit shown on the Bar Graph or Trend screen.	
	Scaling Low	#########	Enter the low and high scaling limits. These limits are used to scale the displayed PV to the desired value when PV Scaling is set to either Linear or Square Root. See Notes 1 and 2 Below.	
	Scaling High	#########		
	Custom Tag	□□□□□□□□□□□□□□	Enter Custom Tag using any alphanumeric value up to 14 characters long.	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next char.

NOTES:

Scaling only affects the value shown on the Display; it does not affect the Loop Output.

1. **Linear scaling of the displayed PV value**
   When "Linear" is selected for PV Scaling, the Display will scale the selected PV input according to the following formula:

   ((PV value – input low limit) / input span) x (Scaling High – Scaling Low) + Scaling Low

   If the PV Selection is Pressure, the input low and high limits are the LRV and URV respectively. If the PV Selection is Percent Output, the input low and high limits are 0 and 100%. If the PV Selection is Square Root, the input low and high limits are 0 and 100 %Flow.

   Note that this scaling only affects the value shown on the Display; it does not affect the Loop Output. [2]

2. **Square Root scaling of the displayed PV value**
   When "Square Root" is selected for PV Scaling, the Display computes %Flow from the Differential Pressure. This calculation is independent of the Transfer Function setting in the transmitter. This allows the user to output Differential Pressure via the 4-20 mA loop output while displaying the equivalent flow value on the Display. In addition, the Display value can be scaled to show the flow in flow units (gal/min, gal/h, etc.) by entering the correct scaling limits via the Scaling Low and Scaling High parameters.

   For example:

PV Selection:	Differential Pressure
PV Scaling:	Square Root
Scaling Low:	0.0
Scaling High:	2500.0
Display Units:	gal/h
LRV:	0.0
URV:	set as required by the process

   The Display will calculate 0-100 %Flow from the Differential Pressure and then scale this to 0 to 2500 gal/h.

   Note that the Square Root calculation is referenced to the LRV and URV settings of the transmitter and it uses the LRV and URV to calculate the %DP input into the Square Root flow algorithm. For normal flow applications, it is assumed that the LRV is set to zero and that zero pressure equals zero flow. If the LRV is less than zero, the Square Root calculation will calculate the flow as bi-directional flow.

3. **PILD Factor value Display**
   PILD Factor can be configured as screen PV selection when the PILD option is enabled. It will not display units and square root indication while displaying in large, trend or bar formats.
   The large PV format provides the current Up Limit and Down Limit values. The PILD Factor value is present only when PILD is enabled and while in Monitoring mode. Otherwise the value will be replaced by a message indicating PILD is disabled or in Training mode.

The trend format provides two dotted horizontal lines on the trend chart to indicate the Up Limit and Down Limit values.

Table 12 – Calibration Menus

<Return> Return to the Level 1 menu				
Set Time Stamp	**<Return>**			
	Hour	# #	These selections allow the user to enter a time stamp for the Zero Correct, LRV Correct, URV Correct, and Reset Corrects. This time stamp can be read via HART and FF communications.	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit ↑ and ↓ to select from list. ↵ to enter
	Minute	# #		
	Year	# # # #		
	Month	January thru December		
	Day	# #		
Zero Correct	**<Return>**			
	Do Zero Corr.	Executing this selection corrects the Zero based on the input pressure. The current live value of the primary pressure input is shown on this display so the user can easily see the effect of the Zero correction.		Press ↵ to enter menu selection Scroll to Do Zero Corr. Press ↵ to initiate
LRV Correct	**<Return>**			
	Do LRV Correct	Executing this selection corrects the LRV based on the input pressure. The current live value of the primary pressure input is shown on this display so the user can easily see the effect of the LRV correction.		Press ↵ to enter menu selection Scroll to Do LRV Correct Press ↵ to initiate
URV Correct	**<Return>**			
	Do URV Correct	Executing this selection corrects the URV based on the input pressure. The current live value of the primary pressure input is shown on this display so the user can easily see the effect of the URV correction.		Press ↵ to enter menu selection Scroll to Do URV Correct Press ↵ to initiate
Reset Corrects	**<Return>**			
	Reset Corrects	Executing this selection Resets the Zero, LRV, and URV Corrects back to Factory values		Press ↵ to enter menu selection Scroll to Reset Corrects Press ↵ to initiate

DAC Trim Note: Loop must be removed from Automatic Control	**<Return>**			
	Trim Zero	This selection will calibrate the loop zero output to 4.000 mA Connect a current meter to the transmitter to monitor the loop output. When you press Enter, the transmitter will set the loop output to 4 mA. When the prompt "Enter reading" appears, enter the value shown on the current meter (in milliamps) and press Enter again. The transmitter will adjust the DAC output to 4mA.		Press ↵ to enter menu selection Scroll to Trim Zero or Trim Span Press ↵ to initiate ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Trim Span	This selection will calibrate the loop span output to 20.000 mA Connect a current meter to the transmitter to monitor the loop output. When you press Enter, the transmitter will set the loop output to 20 mA. When the prompt "Enter reading" appears, enter the value shown on the current meter (in milliamps) and press Enter again. The transmitter will adjust the DAC output to 20 mA.		
	Set DAC Normal	This selection allows the loop to be returned to its Normal mode (Automatic Control) after performing the Trim operation.		Press ↵ to enter menu selection Scroll to Set DAC Normal Press ↵ to initiate
Loop Test Note: Loop must be removed from Automatic Control	**<Return>**			
	Set DAC Output	This selection allows the user to force the DAC output to any value between 3.8 and 20.8 mA. Note: This selection will put the DAC into Fixed Output Mode.		Press ↵ to enter menu selection Scroll to Set DAC Output Press ↵ to initiate ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Set DAC Normal	This selection allows the loop to be returned to its Normal mode (Automatic Control) after performing the Set DAC Output operation		Press ↵ to enter menu selection Scroll to Set DAC Normal Press ↵ to initiate
Factory Cal	**<Return>**			
	Active Cal Set	Displays the calibration used by the transmitter.		
	Select Cal Set	<Return> Cal Set A Cal Set B* Cal Set C** Best Fit	This selection allows the user to choose calibration set from drop-down menu,	Press ↵ to enter menu selection Press ↑ and ↓ to select calibration type. ↵ to initiate

NOTES:

* "Cal Set B" item in menu is available only if sensor supports Dual calibration

** “Cal Set C” item in menu will be available only if sensor supports Triple calibration.

Table 13 – Transmitter Setup Menus

<Return> Return to the Level 1 menu				
Parameters	**<Return>**			
	Tag ID	□□□□□□□□	Enter Tag ID name up to 8 characters long. □ = any Alphanumeric value	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character to the right.
	Damping (sec)	##. #	Selection applies digital filtering to suppress noise effects on the PV. The limits for this value are 0.0 to 32.0 seconds	
	NAMUR Selection	Disabled	Disabling sets the loop output and burnout levels to the Honeywell levels	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
		Enabled	Enabling sets the loop output and burnout levels to the NAMUR levels	
	Filter Performance	Fast SOR	Fast Speed of Response	
		Std SOR	Standard Speed of Response	
Parameters	Transfer Function	Linear	The loop output of the transmitter is a linear representation of the differential pressure.	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
		Square Root	The loop output of the transmitter represents %Flow as defined by the DP Square Root flow equation.	
	Flow Cutoff	Single Breakpt	Allows the user to specify a single breakpoint as the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	
		Dual Slope	Uses a dual slope formula to determine the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	
	Breakpt(%Flow)	##. #	Enter the low flow cutoff point when Single Breakpt	

			is selected. Range: 0 to 25.0 %Flow.	

Enter LRV	**<Return>**			
	Enter LRV	###. ##	The limit for the Lower Range Value is 2X the Lower Range Limit (LRL) of the Meterbody	
Enter URV	**<Return>**			
	Enter URV	###. ##	The limit for the Upper Range Value is 2X the Upper Range Limit (URL) of the Meterbody	
Set LRV	**<Return>**			
	Set LRV	ATTENTION: Executing this service will set the Lower Range Value (LRV) equal to the input pressure		Press ↵ to enter menu selection ↵ to execute
Set URV	**<Return>**			
	Set URV	ATTENTION: Executing this service will set the Upper Range Value (URV) equal to the input pressure		Press ↵ to enter menu selection ↵ to execute
HART Setup	**<Return>**			
	Device ID	Unique for each device		Read Only
	Universal Rev	HART Revision		Read Only
	Field Device Rev	For DD/DTM compatibility		Read Only
	Final Assy Num	Asset tracking number		
	Loop mA	Disabled for Multidrop		
	Poll Address	0 (default) to 63		
	PV Units	Units of transmitted PV		
	SV Units	Units of transmitted SV		
HART Date	**<Return>**			
	Year	# # # #	Enter the current year.	
	Month	January thru December	Select the current month.	
	Day	# #	Enter the day of the month.	
	Write Date	Press ENTER to write the HART Date to the transmitter.		

Install Date	**<Return>**			
	Year	# # # #	Enter the current year. This item will only be visible if no Install Date has been written to the transmitter.	
	Month	January thru December	Select the current month. This item will only be visible if no Install Date has been written to the transmitter.	
	Day	# #	Enter the day of the month. This item will only be visible if no Install Date has been written to the transmitter.	
	Install Date	dd-mmm-yyyy	If no Install Date has been set in the transmitter, this value is a preview of the Year, Month, and Day entered above. Otherwise, this is the Install Date that was previously written to the transmitter.	
	Write Date	Press ENTER to write the Install Date to the transmitter. **<u>CAUTION</u>**: The Install Date can only be written once in the life of the transmitter. You cannot erase or overwrite the Install Date once it has been written.		
PILD (Available only if the PILD Option is enabled)	<Return>			
	PILD	Disabled	Disables PILD detection	Press ↵ to enter menu selection ↑ and ↓ to select Disabled or Enabled. ↵ to initiate. This option will be available only if sensor supports PILD feature
		Enabled	Enables PILD detection	
	Application	<Return>	**See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select Application Type. ↵ to initiate.
		DP Flow (Available only for DP Transmitter)		
		Marine Level		
		Bubbler Level		
		Other		

PILD (Available only if the PILD Option is enabled)	Sample Window	##	The sampling window of PILD in minutes, which determines the cycle of PILD runs for both training and monitoring mode. Enter the sample window Value. Range: 3 mins, 6 mins, 9 mins, 12 mins, 15 mins. **See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit.
	Up Limit	#.##	The up limit of PILD factor for normal status.. Enter the Up Limit Value. Range: 0.50 to 1.00. **See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Down Limit	#.##	The Down limit of PILD factor for normal status.. Enter the Down Limit Value. Range: Both Limit to 0.50 **See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	Both Limit	#.##	The Both sides blockage limit of PILD. Enter the Both Limit Value. Range: 0.00 to Down Limit. It is applicable for only DP Transmitter. **See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
	HPF f0	#.#	The High Pass Filter (HPF) Cutoff Frequency (f_0) reduces noise fluctuations in the PILD Factor measured value. Enter the HPF f0 Value. Range: 0.0 to 5.0. **See Note below.**	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit

Note:
This parameter will be “Read Only” when the user configures PILD as Enabled in this sub menu. An attempt to configure this parameter will then invoke the pop-up message”Read Only! PILD Active”. The parameters Up

Limit, Down Limit and Both Limit are available to change in Monitoring mode while PILD is enabled. An attempt to change these parameters in Training mode results in the pop-up "Read Only! Training Mode".

Table 14 – Information Menus

<Return> Return to the Level 1 menu			
Display	**<Return>**		
	Firmware Version	The firmware version of the Display Module	Read Only
Elec Module	**<Return>**		
	Firmware Version	The firmware version of the Electronics Module	Read Only
	HART/DE Version	The firmware version number of the Electronics Module as displayed via the HART and DE protocols	Read Only
	Protocol	The communications protocol of the transmitter: • HART: HART protocol • DE: Honeywell DE protocol • FF: Foundation Fieldbus	Read Only
Meterbody	**<Return>**		
	Firmware Version	The firmware version of the Meterbody	Read Only
	Model Key	Identifies the type and range of the transmitter	Read Only
	Units	The Engineering Units for the LRL and URL. Note that you can change these Units from the Transmitter Setup menu, if desired (Transmitter Setup\Parameters\Units)	Read Only
	LRL	The Lower Range Limit of the Meterbody	Read Only
	URL	The Upper Range Limit of the Meterbody	Read Only
Options	**<Return>**		
	PILD	Available/Not Available	Read Only
	Serial Number	Unique serial number of the transmitter	Read Only
	License Key	######## License key to enable PILD option	Write only (enter numeric license key

4.2.6 The Basic Display Menu

The Basic Display Menu is implemented as one long single-level menu and will "wrap around" when it reaches the start or end of the menu. Operation is as follows:

Press the ↵ button to call up the Menu.

1. Select <**Exit Menu**> and press ↵ to exit the Menu.
2. Use the ↑ and ↓ buttons to scroll through the list of menu items.

3. Press the ↵ button to select an item for data entry or activation. When an item is selected for data entry or activation, the cursor will jump to the lower line of the LCD to allow editing of the value. No action is taken against a menu item until the user presses the ↵ button.
4. If you want to abort a data entry operation, simply refrain from pushing any buttons for 10 seconds; the data entry operation will time out and the original value of the selected item will be preserved.

Table 15 – The Basic Display Menus

LCD Contrast	»»»»»»	Adjust the LCD contrast level. Range from » (1) to »»»»»»»»»» (9) Default: »»»»»»»» (7)		Press ↵ to enter menu selection ↑ and ↓ to select level. ↵ to enter
PV Display	Pressure	Pressure Units	Select Process Variable (PV) to be shown on the display from list.	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
	Percent Output	%		
	Custom Output			
	Loop Output	mA		
PV Decimal	None	Select the PV decimal resolution to be shown on selected screen from list.		
	X.X			
	X.XX			
	X.XXX			
Custom Units (Available only when Custom Output PV Display is selected)	□□□□□□□□	Enter custom text using any alphanumeric value up to 8 characters long.		Custom Units: ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character
Scaling Low (Available only when Custom Output PV Display is selected)	#########	Enter the low and high scaling limits. These limits are used to scale the loop output to the desired value.		Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to next digit
Scaling High (Available only when Custom Output PV Display is selected)	#########			
Custom Tag	□□□□□□□□□□□□□□	Enter Custom Tag using and alphanumeric value up to 14 characters long		Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next char.

Range / Cal Units	atm, bar ftH2O @ 68ºF gf/cm2 inH2O @ 39ºF inH2O @ 60ºF inH2O @ 68ºF inHg @ 0ºC kgf/cm2, kPa mbar, mmH2O @ 4ºC, mmH2O @ 68ºF, mmHg @ 0ºC, MPa, Pa, psi Torr, mH2O @ 4ºC mHg @ 0ºC	Choose engineering units for LRV, URV and Corrects values	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Pressure Units (Available only when Pressure PV Display is selected)	atm, bar ftH2O @ 68ºF gf/cm2 inH2O @ 39ºF inH2O @ 60ºF inH2O @ 68ºF inHg @ 0ºC kgf/cm2, kPa mbar, mmH2O @ 4ºC, mmH2O @ 68ºF, mmHg @ 0ºC, MPa, Pa, psi Torr, mH2O @ 4ºC mHg @ 0ºC	Choose appropriate engineering units from list	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Zero Correct	Do Correct	Executing this selection corrects the Zero based on the input pressure	Press ↵ to enter menu selection Press ↵ to initiate action
LRV Correct	Do Correct	Executing this selection corrects the LRV based on the input pressure	
URV Correct	Do Correct	Executing this selection corrects the LRV based on the input pressure	
Reset Corrects	Do Correct	Executing this selection Resets the Zero, LRV, and URV Corrects back to Factory values	

Active Cal Set	Shows one of the option below: Cal Set A Cal Set B Cal Set C Best Fit	Displays the current calibration used by the sensor. Cal Set B is only available with dual calibration Cal Set C is only available with triple calibration	Read Only Parameter
Select Cal Set	Cal Set A Cal Set B Cal Set C Best Fit	This selection allows the user to choose calibration type from the list. Cal Set B is only available with dual calibration Cal Set C is only available with triple calibration	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
DAC Zero Trim Note: Loop must be removed from Automatic Control	DAC Zero Trim	This selection allows the loop zero output 4mA value to be trimmed. Note: You must connect a current meter to the transmitter to monitor the loop output.	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to the next digit to the right
DAC Span Trim Note: Loop must be removed from Automatic Control	DAC Span Trim	This selection allows the loop span output 20mA value to be trimmed. **Note:** You must connect a current meter to the transmitter to monitor the loop output.	
Loop Test Note: Loop must be removed from Automatic Control	Loop Test 12.000	This selection allows the user to force the DAC output to any value between 3.8 and 20.8 mA. Note: This selection will put the DAC into Fixed Output Mode, as indicated by the flashing output value. Navigation away from this menu item will return the loop to Normal (Automatic) Mode.	
LRV URV	#. ## #. ##	The limits are: 2X the Lower Range Limit (LRL) of the Meterbody and 2X the Upper Range Limit (URL) of the Meterbody	Press ↵ to enter menu selection ↑ and ↓ to select number. ↵ to enter and shift to the next digit to the right
Damping	#. ##	Selection applies digital filtering to suppress noise effects on the PV. The limits for this value are 0.0 to 32.0 seconds	
NAMUR	Enabled Disabled	Disabling sets the loop output and burnout levels to the Honeywell levels	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Filter Perf	Fast SOR Standard SOR	Fast Speed of Response Standard Speed of Response	

Transfer Function (only available for DP Transmitters)	Linear	The loop output of the transmitter is a linear representation of the differential pressure	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character to the right.
	Square Root	The loop output of the transmitter represents %Flow as defined by the DP Square Root flow equation.	
Flow Cutoff	Single Breakpt	Allows the user to specify a single breakpoint as the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	
	Dual Slope	Uses a dual slope formula to determine the low flow cutoff point. This item is only available when the Transfer Function is set to Square Root.	
Flow Breakpoint	##. #%	Enter the low flow cutoff point when Single Breakpt is selected. Range: 0 to 25.0 %Flow.	
Tag ID	□□□□□□□□	Enter Tag ID name up to 8 characters long. □ = any Alphanumeric value	Press ↵ to enter menu selection ↑ and ↓ to select Alphanumeric ↵ to enter and shift to next character to the right.
HART Device ID	Unique for each device		Read Only
HART PV Units	Units of transmitted PV		
PILD (optional)	Enabled Disabled	This selection allows the user to enable or disable PILD detection. This item will be available only if the PILD option is enabled.	Press ↵ to enter menu selection ↑ and ↓ to select from list ↵ to enter
Serial Number	Unique serial number for the transmitter		Read only
License key	# # # # # # # #	License key to enable PILD option	Write only
Install Date	DD MM YYYY	This selection allows the user to enter the date a transmitter is installed. The Install Date is entered in sequence of Day, Month, and Year, followed by the new date and the prompt Write Date to confirm the entry. **CAUTION**: The Install Date can only be written once in the life of the Transmitter. You cannot erase or overwrite the Install Date once it has been written.	Press ↵ to enter menu selection ↑ and ↓ to select number ↵ to enter and shift to next digit to the right. Read Only after entered

Firmware	Display Electronics Meterbody	Menu item shows the current Firmware versions of the Display, Electronics Module and the Meterbody	Read Only Parameter
Protocol	HART DE FF	Menu item shows the communications protocol	
Model Key		Identifies the type and range of the transmitter	Read Only Parameter
<Exit Menu>			

4.2.7 Selecting a new setting from a list of choices

Use the procedure described below to select a new setting for parameters that present a list of choices (e.g., PV Display, Pressure Units, etc.)

1. Press ↵ to begin the edit process. The Basic Display will show the current setting of the item on the lower line, left justified.
2. Press the ↑ or ↓ buttons to scroll through the list of choices.
3. Press ↵ to make your selection. The new selection will be stored in the transmitter and displayed on the lower line, right justified.

4.3 Three Button Operation with no Display Installed

When there is no Display installed, the buttons can be used to perform a Zero or Span adjustment of the Transmitter. Caution should be taken to insure these adjustments are only made when the correct input pressures are applied.

4.3.1 Zero Adjustment

This adjustment is the same as performing a Set LRV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 16 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the Transmitter LRV.
3. Press the Down (↓) and Zero (↑) buttons together to set the Zero.
4. Verify that the output is now 4 mA.

4.3.2 Span Adjustment

This adjustment is the same as performing a Set URV using the Display.

1. Connect a current meter or voltmeter as shown in Figure 16 to monitor the PV output of the Transmitter.
2. Using an accurate pressure source, apply pressure equivalent to the desired Upper Range Value of the transmitter.
3. Press the **Down (↓)** and **Span (↵**) buttons together to set the span.
4. Verify that the PV output is now 20 mA.

 You can also use the MCT 202 Toolkit to make any adjustments to an ST 800 SmartLine Pressure Transmitter. Alternately, certain adjustments are possible through an Experion Station or Universal Station, if the ST 800 is digitally integrated with either of these stations.

4.4 Changing the Default Failsafe Direction

Transmitters are shipped with a default failsafe direction of upscale. This means that the Transmitter output will set the current output to upscale failsafe (maximum output) upon detection of a critical status. You can change the direction from upscale failsafe to downscale failsafe (minimum output) by moving the top jumper located in the Electronics module.

4.4.1 DE and Analog Differences

Failsafe operation is somewhat different between DE and analog operation:

- **Analog operation** – Upscale failsafe drives the Transmitter output to 21.8 mA. Downscale failsafe drives the Transmitter output to 3.8 mA.
- **DE operation** – Upscale failsafe causes the Transmitter to generate a **+ infinity** digital signal. Downscale failsafe causes the Transmitter to generate a **– infinity** digital signal.

The Transmitter electronics module interprets either signal as *not-a-number* and initiates its own configured failsafe action for the control system.

4.4.2 Procedure to Establish Failsafe Operation

The failsafe direction display accessible via the Toolkit shows only the state of the jumper as it correlates to analog Transmitter operation. Failsafe action for the DE control system may be configured to operate in a manner different from analog, as indicated by the state of the Transmitter jumper.

The integrated circuits in the Transmitter PWA are vunerable to damage by stray static discharges when removed from the Electronics Housing. Minimize the possibility of static discharge damage when handling the PWA as follows:

Do not touch terminals, connectors, component leads, or circuits when handling the PWA.

When removing or installing the PWA, handle it by its edges or bracket section only. If you need to touch the PWA circuits, be sure you are grounded by staying in contact with a grounded surface or by wearing a grounded wrist strap.

When the PWA is removed from the Transmitter, put it in an electrically conductive bag, or wrap it in aluminum foil to protect it.

The following procedure outlines the steps for positioning the write protect and failsafe jumpers on the electronics module. See Figure 18 for the locations of the failsafe and write protect jumpers.

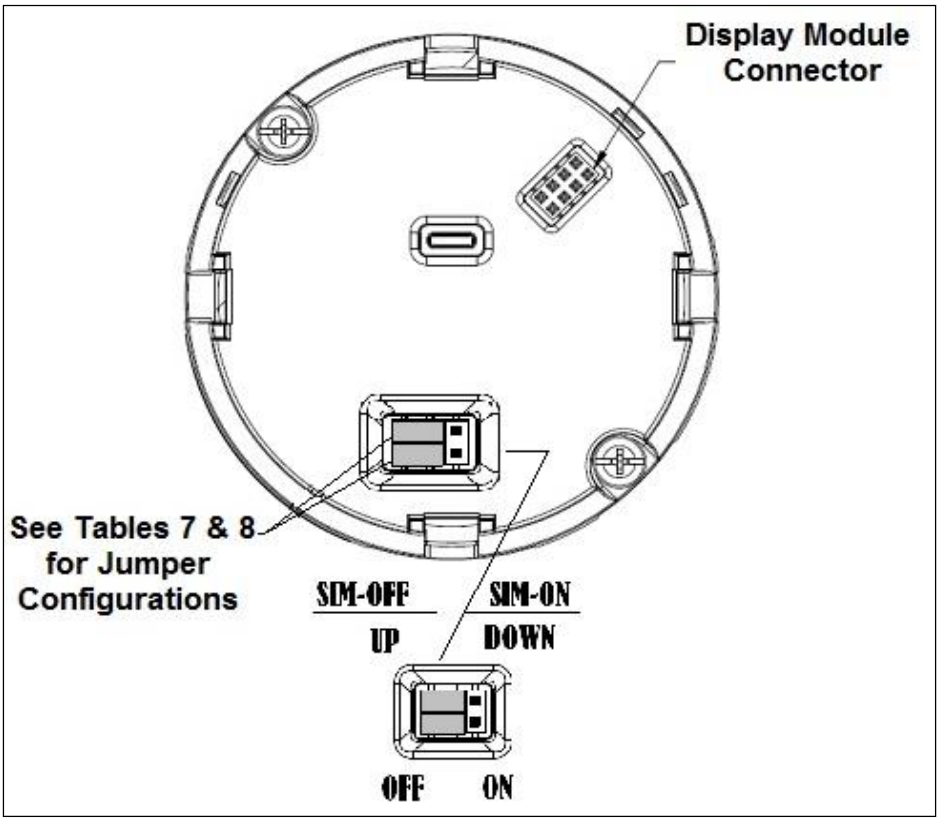

Figure 18 – Locating the Failsafe and Write Protect Jumpers

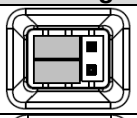
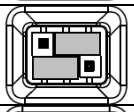
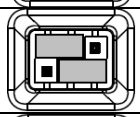
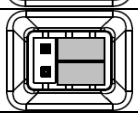
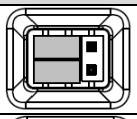
Table 16 – Hart and DE Failsafe and Write Protect Jumpers

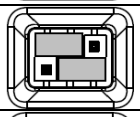


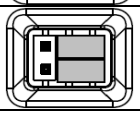












Jumper Arrangements	Description
	Failsafe = UP (High) Write Protect = OFF (Not Protected)
	Failsafe = DOWN (Low) Write Protect = OFF (Not Protected)
	Failsafe = UP (High) Write Protect = ON (Protected)
	Failsafe = Down (Low) Write Protect = On (Protected)

Table 17 – Fieldbus Simulation and Write Protect Jumpers

Image	Description
	Fieldbus Simulation Mode = OFF Write Protect = OFF (Not Protected)
	Fieldbus Simulation Mode = OFF Write Protect = ON (Protected)
	Fieldbus SIM Mode = ON Write Protect = OFF (Not Protected)

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosionproof and Class 1 Div 2 environments).

2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.

3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.

4. If necessary, unplug the interface connector from the Communication module. Do not discard the connector.

5. Set the Failsafe Jumper (top jumper) to the desired position (UP or DOWN). See Table 16 and Table 17 for jumper positioning.

6. If applicable, re-install the Display module as follows:
   - Orient the display as desired.
   - Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.
   - Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

NOTE: Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.

Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90 º increments.

7. Restore transmitter power if removed.

4.5 Monitoring the Basic and Advanced Displays

This section describes the information shown on the operator screens of the Advanced and Basic Displays.

4.5.1 Basic Display

Figure 19 illustrates the Basic Display format with Process Variable (PV).

- The PV value is user-configurable. This field has 7 characters. The maximum allowable numeric value is 9999999 or -999999. If fractional decimals are configured, the fractional positions will be dropped, as required. If the PV value exceeds the above limits, it is divided by 1000 and "K" is appended to the result, allowing a maximum value with multiplier of 999999K or -99999K.
- Process Variable Tag is user-configurable from a HART Host. This field has 14 characters.
- Engineering Units. This field is user-configurable. This field has 8 characters.

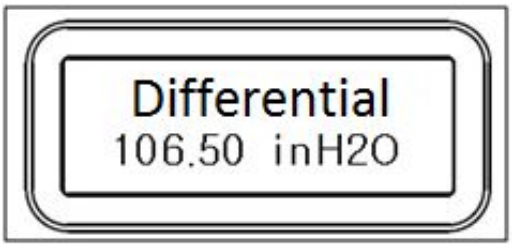


Figure 19 – Basic Display with Process Variable Format

4.5.2 Advanced Displays

As shown in Figure 20 , the Advanced Display provides three formats. Table 18 lists and describes the fields in each of the three Advanced Display formats. Essentially, all three formats provide the same information, but with the following differences:

- Bar Graph. User Configurable 126 segment Bar Graph with range settings. The Bar Graph displays the current value of the configured PV.
- PV Trend. User-configurable display period from one hour to 24 hours. The chart displays minimum, maximum, and average of the configured PV over the selected trend period.

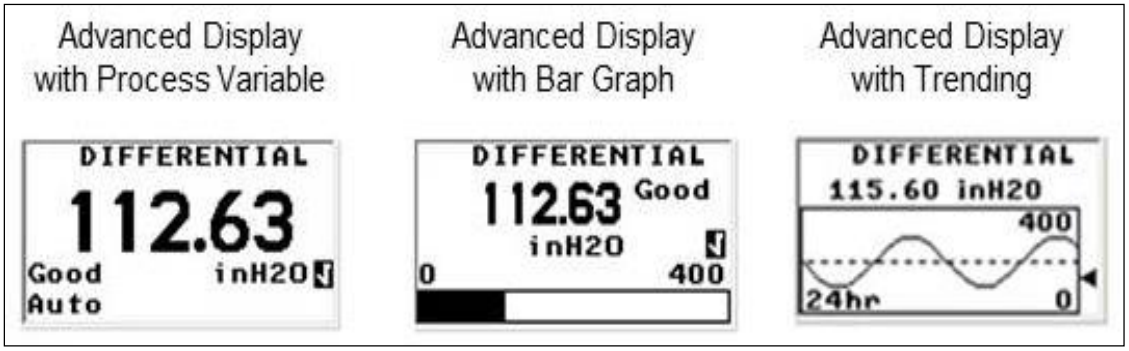

Figure 20 – Advanced Display Formats with the Process Variable

Table 18 – Advanced Displays with PV Format Display Indications

Display Indicator	What It Means
Diagnostic / Maintenance These indicators are displayed in the upper left corner of the screen when the associated conditions are present in the transmitter.	D Diagnostic condition present This indicator is displayed any time a diagnostic is present in the transmitter, either Critical or Non-Critical. If a Critical Diagnostic is present, the message "Critical Diag" will flash at the top of the screen and the appropriate Diagnostic screen will be inserted into the normal screen rotation.  To determine which Non-Critical diagnostics are active, use the local buttons to call up the Non-Critical diagnostics menu (Main Menu\Diagnostics\Non-Critical. Refer to Table 10 for details concerning the Non-Critical diagnostics. M Maintenance Mode is active This indicator is set by the Experion DCS. When this Mode is active, a screen with the text "Available for Maintenance" will be inserted into the normal screen rotation to make it easy to identify transmitters that are available for maintenance.
PV Value	User Configurable. This field has 7 characters. Maximum allowable numeric value of 9999999 or -999999. If fractional decimals are configured, the fractional positions will be dropped as required. If the PV exceeds the values above limits, the PV is divided by 1000 and "K" is appended to the result, allowing a maximum value with multiplier of 999999K or -99999K
PV Status:	Good The transmitter is operating normally Bad The transmitter has detected a fault condition. The PV Status field will flash when this condition is present and the PV Value will be displayed on a black background as shown below:  Unc Uncertain (this status is only available for FF transmitters) The PV Value is outside of normal limits.

</table>

4.5.3 Button operation during monitoring

When the operator screens are active on the Advanced Display, the Increment and Decrement buttons (↑ and ↓) can be used to move to the next or previous operator screen without waiting for the rotation time to expire. Pressing the Enter button (↵) will call up the Main Menu.

5 Maintenance

5.1 Overview

This section provides information about preventive maintenance and replacing damaged parts. The topics covered in this section are:

- Preventive maintenance of the meter body barrier diaphragms and process piping to the Transmitter.
- Replacement of damaged parts such as the Transmitter Printed Wiring Assembly (PWA) and meter body

5.2 Preventive Maintenance Practices and Schedules

The ST 800 Transmitter does not require any specific maintenance at regularly scheduled intervals. However, it is recommended that you perform these typical inspection and maintenance routines on a schedule that is dictated by the characteristics of the process medium and if blow-down facilities or purge systems are being used.

- Check piping for leaks.
- Clear piping of sediment or other foreign matter.
- Clean the Transmitter process heads, including the barrier diaphragms.

5.3 Inspecting and Cleaning Barrier Diaphragms

Depending on the characteristics of the process medium, sediment or other foreign particles may collect in the process head cavity/chamber and cause faulty measurement. In addition, the barrier diaphragm(s) in the Transmitter meter body may become coated with residue from the process medium. The latter is also true for external diaphragms on flange-mount and remote seal type Transmitters.

In many cases, you can readily remove the process head(s) from the Transmitter meter body to clean the process head cavity and inspect the barrier diaphragm(s). For flange-mount and remote seal diaphragms, you may only need to run a purge line in the tank to rinse off the face of the diaphragm(s).

The following procedure comprises the general steps for inspecting and cleaning barrier diaphragms. You may have to modify these steps to meet your particular process or transmitter model requirements. Figure 21 shows an exploded view of a Differential Pressure (DP) Transmitter meter body for reference. For disassembly/reassembly purposes, Gauge Pressure (GP) and Absolute Pressure (AP) Transmitters are similar.

 It is recommended that you remove the Transmitter from service and move it to a clean area before disassembling it.

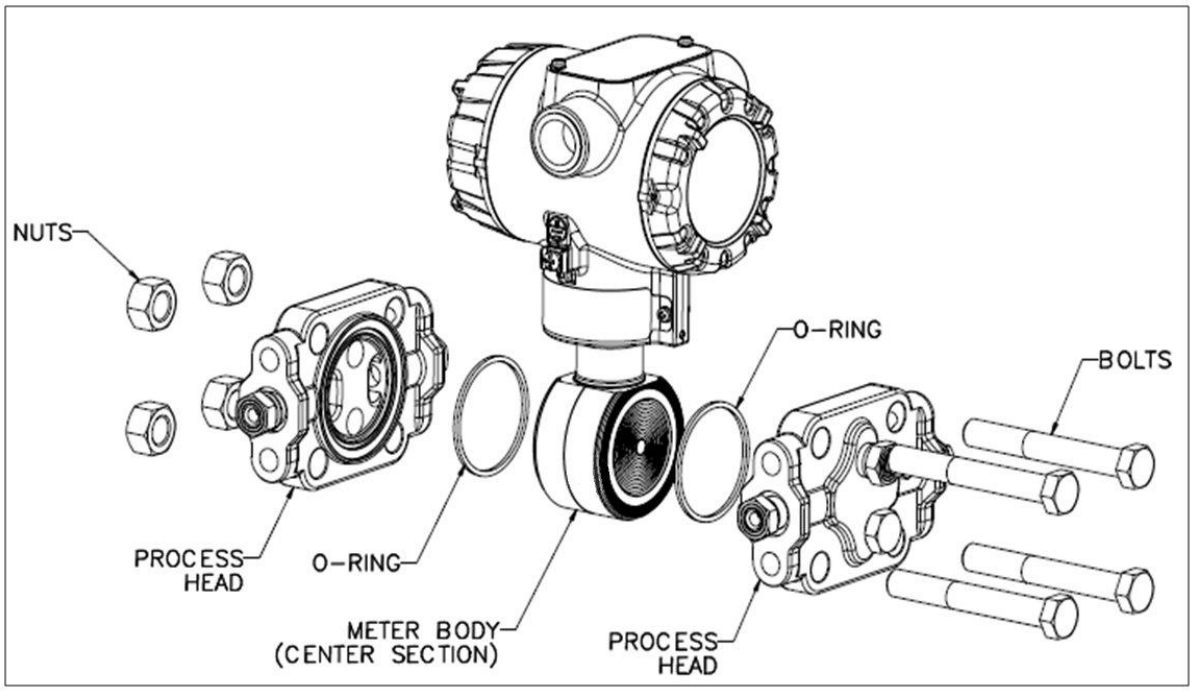

Figure 21 – DP Transmitter Head Disassembly

1. Close all valves to isolate the Transmitter from the process.
2. Open the vent in the process head to drain fluid from the Transmitter meter body, as necessary.
3. Remove the Transmitter from the process.
4. Loosen the nuts in the sequence shown in Figure 22.
5. Remove the nuts from the bolts that hold the process head(s) to the meter body.
6. Remove the process heads and bolts.
7. Remove the gasket/ O-ring, and clean the interior of the process head using a soft bristle brush and an approved solvent.
8. Inspect the barrier diaphragm for signs of deterioration, corrosion, and distortion.
9. If the diaphragm is distorted contact Honeywell for assistance.
10. Install a new gasket/O-ring in each process head.
11. Coat threads on the process head bolts with a suitable anti-seize compound, such as "Neverseize," or equivalent.
12. Using a torque wrench, gradually tighten the nuts in the sequence shown in Figure 22. Tighten head bolts in stages of 1/3-full torque, 2/3-full torque, and full torque. See Table 19 for torque requirements versus Transmitter type and model.

5.4 Replacing the Communication Module

The Communication module includes a connector to the sensor ribbon cable and a connector to the optional Display module. This section includes the procedure to replace the Communication module.

The transmitter does not have to be removed from service to replace the Comm Module

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

Refer to Figure 23 for parts locations.

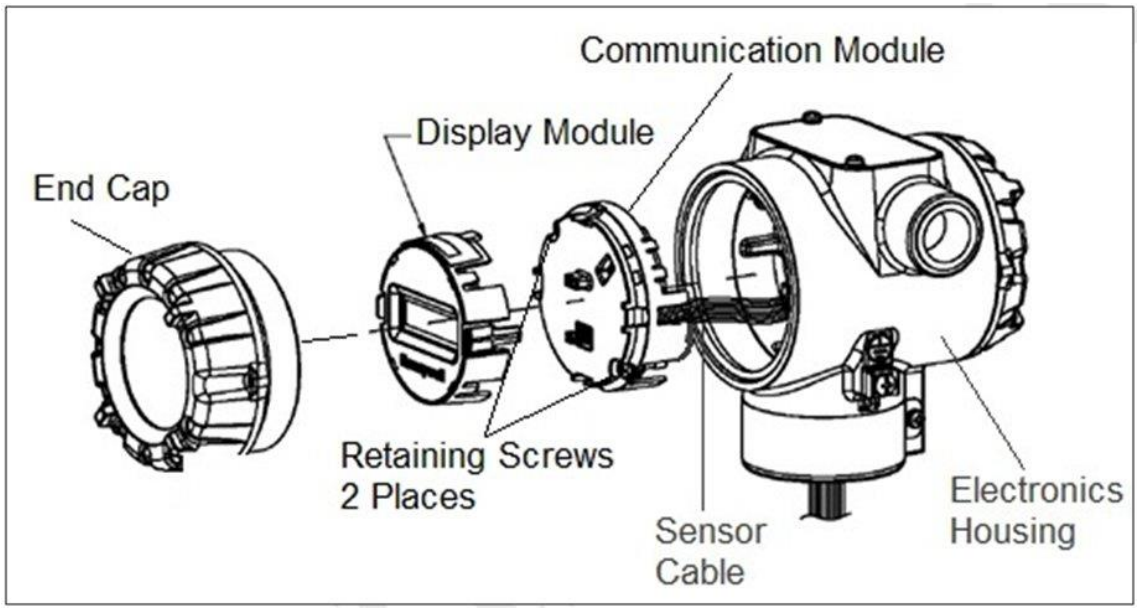

Figure 23 – PWA Replacement

1. Turn OFF Transmitter power (Power removal is only required in accordance with area safety approvals. Power removal is only required in Class 1 Div 1 Explosionproof and Class 1 Div 2 environments).
    - When removing the Communications Module with power applied, the loop will go to 0V. Likewise, installing a Communications Module into a transmitter with power applied will cause the loop output value to go to 12 ma for several seconds then the loop output value will go to the configured value based on the PV input.
    - Installing a Display Module into a powered transmitter may cause a temporary upset to the loop output value.
2. Loosen the end cap lock, and unscrew the end cap from the electronics side of the Transmitter housing.

3. If equipped with a Display module, carefully depress the two tabs on the sides of the Display Module, and pull it off.

4. If necessary, unplug the interface connector from the Communication module. **Do not discard the connector**.

5. Loosen the two retaining screws, and carefully pull the Communication module from the Electronics compartment.

6. Carefully align and connect the Sensor Ribbon Cable to the connector "J4" at the bottom of the Communication module. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.

7. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.

8. Tighten the two Communication module retaining screws.

9. Refer to the Section 4.4 to change the FAILSAFE, READ/WRITE, and SIM-OFF/SIM-ON (Fieldbus Only) configuration settings.

10. If applicable, re-install the Display module as follows:

    a) Orient the display as desired.

    b) Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.

    c) Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90 º increments.

11. Apply Parker Super O-ring Lubricant or equivalent to the end cap O-ring before installing the end cap. Reinstall the End Cap and tighten the End Cap locking screw.

12. Installing Optional External Configuration Button Assembly.

    a) Loosen (Do Not Remove) both top nameplate screws and pivot nameplate 90°.

    b) Align the protrusion on the button assembly with the matching opening in the housing and snap the button assembly into the housing.

    c) Rotate the nameplate back to the original position, and tighten the nameplate screws.

(Steps 13 - 16 required for Field Upgrades Only)

13. Loosen the End Cap locking screw and unscrew the End Cap from the Field Wiring side of the transmitter housing.

14. Select the proper Communication/External Configuration upgrade kit label from the label strip provided and adhere to the inside of the Field Wiring compartment End Cap.

15. Apply Parker Super O-ring Lubricant or equivalent to the end cap o-ring before installing the end cap. Reinstall the End Cap and tighten the end cap locking screw.

16. Install external upgrade label (i.e. DEVICE MODIFIED…..) provided on outside of housing as shown in Figure 23.

17. Restore power if removed.

18. Check the settings of the Transmitter Setup and Display Setup parameters to make sure that the transmitter is configured correctly for your application. See the HART and DE User's Manual (ST 800 #34-ST-25-38, ST 700 #34-ST-25-47) for details on HART and DE transmitters. Refer to manual #34-ST-25-39 for additional information about Fieldbus transmitters.

19. If applicable, verify External Button Configuration operation.
    Ready to go.

5.5 Replacing the Meter Body

You can replace the complete meter body, including the process heads, or the meter body only on certain Differential Pressure (DP), Gauge Pressure (GP), and Atmospheric Pressure (AP) Transmitters by using the existing process head(s). Use the following procedure for meter body-only replacement.

1. Save or record device configuration data.
2. Turn off Transmitter power.
3. Remove the Transmitter from service, and move it to a clean area before disassembling it.
4. Refer to Figure 24. Loosen the End Cap Lock, and unscrew the End Cap from the electronics side of the Transmitter housing.

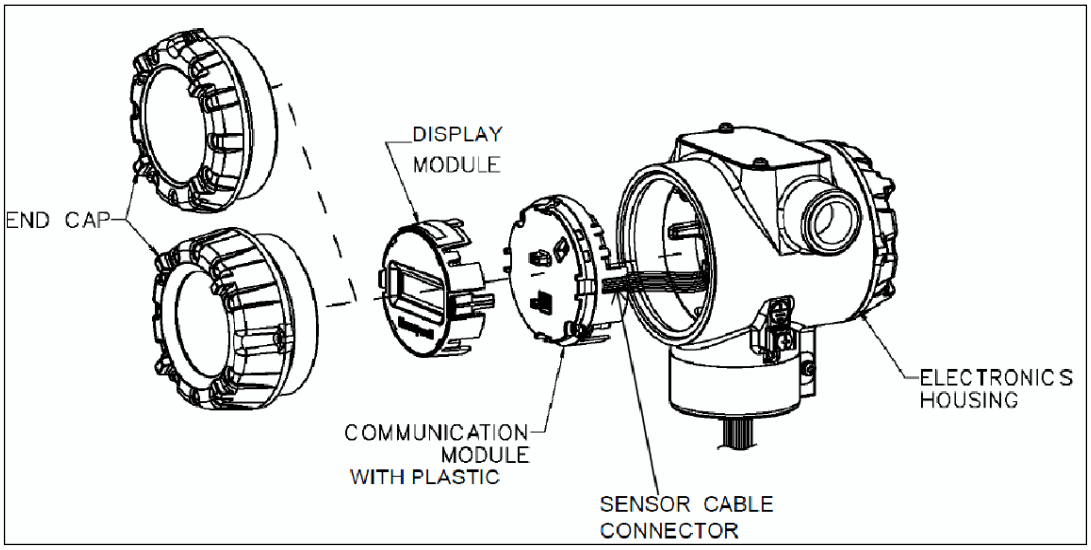

Figure 24 – Disassembly for Meter Body Replacement

Please take appropriate steps to avoid ESD damage when handling the Communication and Display Module assemblies

5. If a display is present, press the two snaps along the side, and remove it from the communication module assembly.
   Note: Do not discard or misplace the Display/Communication connector, it will be required to reassemble the Display Module
6. Loosen the two retaining screws, and remove the Communications Module assembly, and remove the Communication Module assembly from the electronics housing.
7. Disconnect the Sensor Cable from the Communications Board.
8. Refer to Figure 25 . Use a 2 mm hex wrench to completely loosen the set screw on the outside of the housing to permit rotating the meter body.

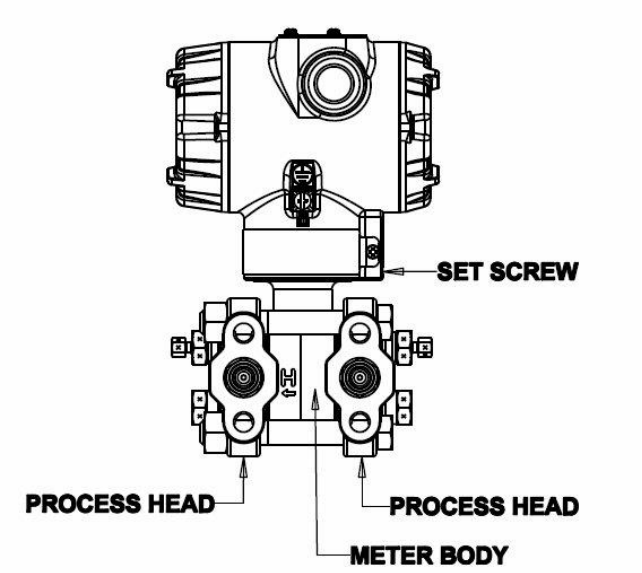

Figure 25 – Hardware Location to Remove the Meter Assembly

9. Carefully turn the complete meter body counterclockwise to unscrew it from the electronics housing.
10. Remove the nuts from bolts that hold the process head(s) to the Meter Body.
11. Remove process heads and bolts.
12. Remove the gaskets or O-rings from the process heads.
13. Clean the interior of the process head(s) with a soft bristle brush and suitable solvent.

CAUTION

To prevent damage to the diaphragm in the Meter Body, use extreme care when handling or placing the Meter Body on any surface. Carefully assemble gaskets or O-rings to the meter body. If installing O-rings, lubricate with water or leave dry.

14. Coat threads on process head bolts with anti-seize compound such as “Neverseize” or equivalent.

15. Refer to Figure 26. Apply Dow Corning #33 silicone grease to the meter body adapter O-ring and carefully assemble the O-ring to the meter body. Assemble the process head(s) and bolts to the new meter body. For now, make the bolts only finger-tight.

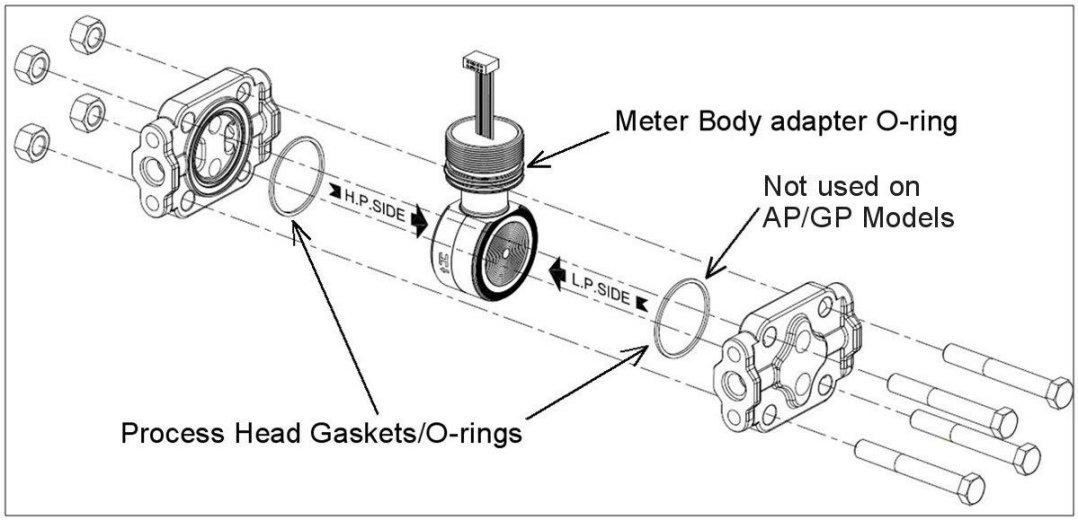

Figure 26 – Meter Body Reassembly

16. Use a torque wrench to gradually tighten nuts to torque rating in sequence shown in Figure 27. Tighten head bolts in stages of 1/3 full torque, 2/3 full torque, and then full torque.

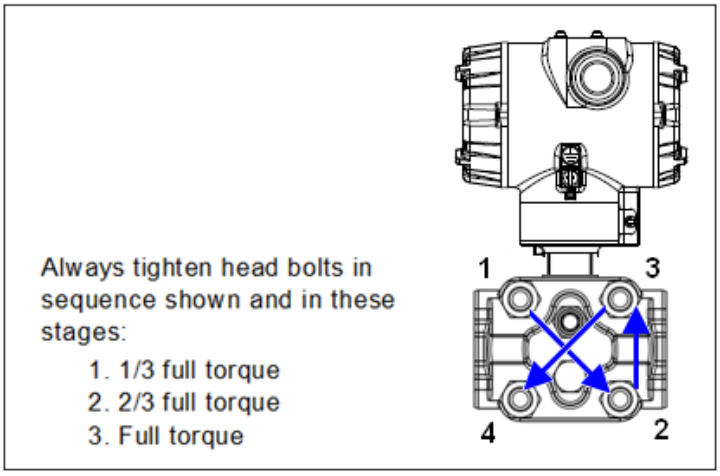

Figure 27 – Head Bolt Tightening Sequence

17. Feed the ribbon cable on the new meter body through the neck of the housing.

CAUTION

To prevent damage to the ribbon cable, use care when assembling the Meter Body to the electronics housing.

18. Screw the new meter body into the housing until the bottom of the Meter Body adapter is flush with the neck of the electronics housing.

19. Tighten the outside set screw to be sure it is fully seated in the slot in the header.
20. Loosen the set screw ½- turn.
21. Rotate the housing to the desired position (Max. 180^{o} in either direction), and tighten the set screw.
22. Carefully align and connect the Sensor Ribbon Cable to connector "J4" at the bottom of the Communication module board. When installing the Communication module in the next step, be careful not to pinch the Sensor Ribbon Cable.
23. Carefully, insert the Communication module into the Electronics compartment. Ensure that the Sensor Ribbon Cable is not pinched.
24. Tighten the two Communication module retaining screws.
25. If applicable, re-install the Display module as follows:

    a) Orient the display as desired.

    b) Install the Interface Connector in the Display module such that it will mate with the socket for the display in the Communication module.

    c) Carefully line up the display, and snap it into place. Verify that the two tabs on the sides of the display latch.

Orient the Display for proper viewing through the end cap window. You can rotate the meter mounting orientation in 90^{o} increments.

26. Connect the bracket to the Transmitter housing.
27. Recalibrate the Transmitter per Section 6 "Calibration" of this document.
28. Return the Transmitter to service, and turn ON power
29. Verify the Transmitter configuration data. Restore the saved database if necessary.
30. Lubricate the end-cap O-ring with Parker Super O-ring silicone lubricant or equivalent before replacing the end caps.

5.6 PILD Option Licensing

The PILD option can be enabled after the transmitter is shipped by purchasing and activating a license.

To obtain and activate a license for the PILD option:

- Obtain the device's Serial Number from the local display menu or from the host interface.
- Reference document PILD Upgrade Option, ST 800 Instruction (#34-ST-33-73) for firmware revision level requirements.
- Place an order for PILD Field Upgrade for ST 800, part number 50097038-501 with the Serial Number.
- Based on this information the regional distribution centre will generate and return a license key.
- The license is activated by entering the License Key parameter value from the local display menu or host interface.

- A restart of the display only will then occur.
- License activation can be confirmed by observing that the PILD option is enabled using the local display menu or host interface.

6 Calibration

6.1 Recommendations for Transmitter Calibration

The ST 800 Pressure Transmitter does not require periodic calibration to maintain accuracy. Typically, calibration of a process-connected Transmitter will degrade, rather than augment the capability of a smart Transmitter. For this reason, it is recommended that a Transmitter be removed from service before calibration. Moreover, calibration will be accomplished in a controlled, laboratory-type environment, using certified precision equipment.

6.2 Calibration Procedures

For a Transmitter operating in analog mode, you must calibrate its output signal measurement range using any compatible hand-held communicator or a local display.

One calibration option is to use the Honeywell Smart Field Communicator (SFC). Refer to the *Smart Field Communicator Operating Guide*, 34-ST-11-14 for calibration procedures.

Calibration information and procedures for a Transmitter operating in the HART/DE mode are provided in the *ST 800 Series HART/DE Option User's Manual*, document number 34-ST-25-38, Section on "Calibration."

6.2.1 Dual/Triple Cal

STA, STD, STG and STF800 models are optionally offered with multiple calibrations. In lieu of a standard factory calibration, units can be supplied with 1, 2, or 3 customer specified calibrations. These calibrations are stored in the meter body and provide users with factory calibrated performance at up to three different calibrated ranges. This increases application flexibility without requiring any costly recalibration or additional inventory.

7 Troubleshooting

7.1 Overview

Troubleshooting involves responding to error messages, primarily displayed by the MC Toolkit. Error messages that may occur on the Transmitter's local display are fairly self-explanatory and intuitive. However, this section covers the diagnostic messages that indicate critical conditions. Other than the critical conditions, additional detail is not provided. If you require assistance, contact your distributor or Honeywell Technical Support. All other messages are covered by the MC Toolkit Users' Manual.

7.2 Critical Diagnostics Screens

When a Critical Diagnostic is present in the Transmitter, the Advanced Display will show one or more of the screens pictured in Figure 28. These screens will be inserted into the normal screen rotation and displayed between the user-defined operator screens. A description of the diagnostic conditions is given Table 20, along with suggested actions for resolving the problem.

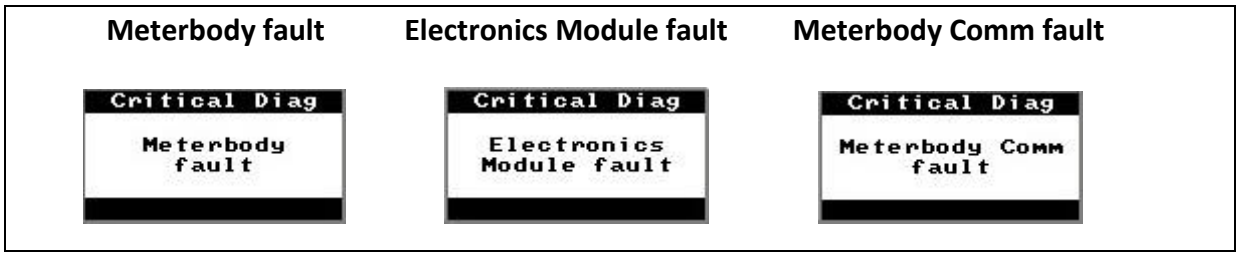

Figure 28 – Local Display Fault Diagnostic Conditions

The Basic Display will display the message CRITCAL FAULT on the top line of the LCD and the appropriate diagnostic text on the lower line.

7.2.1 Fault Conditions and Recommended Corrective Actions

Table 20 – Fault Conditions and Recommended Corrective Actions.

Condtion	Analysis	Recommended Corrective Action
Meterbody fault. A critical failure has been detected in the Meterbody	Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual to get more information about the possible causes of the failure.	Cycle power to the Transmitter. If the problem continues to occur, replace the Meterbody.
Electronics Module Fault. A critical failure has been detected on the HART, DE, or FF Electronics Module.	Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual for more information about the possible failure causes.	Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module.

Meterbody Comm fault. Communications between the Meterbody and the Electronics Module has failed.	This could be the result of a failure on either of these modules or the cable that connects them. Use a HART, DE, or FF communicator to read the detailed status information from the transmitter. Refer to the appropriate communicator manual to get more information about the possible causes of the failure.	Check the ribbon cable that connects the Meterbody to the Electronics Module. Make sure that the cable is securely plugged into the Electronics Module. Make sure that all pins are plugged into the connector (i.e., make sure that the connector is not offset in a way that leaves some pins unconnected). Cycle power to the transmitter. If the problem continues to occur replace the Electronics Module. If this does not fix the problem, replace the Meterbody.

8 Parts List

8.1 Overview

Individually saleable parts for the various Transmitter models are listed in this section. Some parts are illustrated for identification. Parts are identified and listed in the corresponding tables as follows:

- Individually saleable parts are indicated in each figure by key number callout.
- Parts that are supplied in kits are indicated in each illustration by key number callout with the letter K prefix.

Table 21 is a summarized list of recommended spare parts.

(**Refer to Figure 40**)

Key Number	Part Number	Description	Quantity
	50062206-006	**Coplanar Adapter Glass-Filled PTFE (Teflon) Gasket Kit**	
K1		Transmitter-side glass-filled PTFE (Teflon) Gaskets	2
K2		Manifold-side glass-filled PTFE (Teflon) Gaskets	2
	50062206-007	**Coplanar Adapter Fluorocarbon (Viton) O-ring Kit**	
K1		Transmitter-side Fluorocarbon (Viton) O-rings	2
K2		Manifold-side Fluorocarbon (Viton) O-rings	2

USAGE NOTES

50062206-006 - Only use new gaskets when assembling the Coplanar Adapter Kit. Gaskets are designed for one-time use. Do not use gaskets with nicks or other surface damage.

50062206-007 - O-rings removed from service should be discarded and replaced with new o-rings. Do not use o-rings with nicks or other signs of damage.

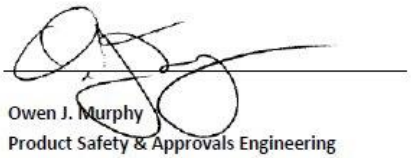
EU DECLARATION OF CONFORMITY

We,
Honeywell International Inc.
Honeywell Field Solutions
512 Virginia Drive
Fort Washington, PA 19034 USA



declare under our sole responsibility that the following products,

ST 800 – Smart Series Pressure Transmitter
And
ST 700- Smart Series Pressure Transmitter

to which this declaration relates, is in conformity with the provisions of the European Community Directives, including the latest amendments, as shown in the attached schedule.

Assumption of conformity is based on the application of the harmonized standards and when applicable or required, a European Community notified body certification, as shown in the attached schedule.

The authorized signatory to this declaration, on behalf of the manufacturer, and the Responsible Person is identified below.

Owen J. Murphy
Product Safety & Approvals Engineering

Notes

1. Operating Parameters:

DE/HART	Voltage= 11 to 42 V	Current= 4-20 mA Normal (3.8 – 23 mA Faults)
Foundation Fieldbus	Voltages = 9 to 23 V	Current = 25 mA

2. Intrinsically Safe Entity Parameters

For details see Control Drawing on page 102.

3. Marking ATEX Directive

General:

The following information is provided as part of the labeling of the transmitter:

- Name and Address of the manufacturer
- Notified Body identification: DEKRA Quality B.V., Arnhem, the Netherlands
- For complete model number, see the Model Selection Guide for the particular model of pressure transmitter.
- The serial number of the transmitter is located on the Meter Body data-plate. The first two digits of the serial number identify the year (02) and the second two digits identify the week of the year (23); for example, 0223xxxxxxxx indicates that the product was manufactured in 2002, in the 23 rd week.

Apparatus Marked with Multiple Types of Protection

The user must determine the type of protection required for installation the equipment. The user shall then check the box [ ] adjacent to the type of protection used on the equipment certification nameplate. Once a type of protection has been checked on the nameplate, the equipment shall not then be reinstalled using any of the other certification types.

4. WARNINGS and Cautions:

Intrinsically Safe and Non-Incendive Equipment:
WARNING: SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR USE IN HAZARDOUS LOCATIONS.
Explosion-Proof/ Flameproof:
WARNING: DO NOT OPEN WHEN AN EXPLOSIVE ATMOSPHERE MAY BE PRESENT
Non-Incendive Equipment:
WARNING: DO NOT OPEN WHEN AN EXPLOSIVE ATMOSPHERE MAYBE PRESENT
WARNING: FOR CONNECTION IN AMBIENTS ABOVE 60ºC USE WIRE RATED 105oC

5. Conditions of Use for Ex Equipment, "Hazardous Location Equipment" or "Schedule of Limitations":

Painted surface of the ST800 may store electrostatic charge and become a source of ignition in applications with a low relative humidity less than approximately30% relative humidity where the painted surface is relatively free of surface contamination such as dirt, dust or oil. Cleaning of the painted surface should only be done with a damp cloth.

Flame-proof Installations: The Transmitter can installed in the boundary wall between an area of EPL Ga/ Class I Zone 0/ Category 1 and the less hazardous area, EPL Gb/ Class I Zone 1/ Category 2. In this configuration, the process connection is installed in EPL Ga/ Class I Zone 0/ Category 1, while the transmitter housing is located in EPL Gb/ Class I Zone 1/ Category 2.

The applicable temperature class, ambient temperature range and maximum process temperature of the equipment is as follows;
T5 for -50°C < Ta < 85°C
T6 for -50°C < Ta < 65°C
Maximum process temperature = 125°C

Consult the manufacturer for dimensional information on the flameproof joints for repair.

The Transmitter can be installed in the boundary wall between an area of Category 1 and the less hazardous area, Category 2. In this configuration, the process connection is installed in Category 1 while the transmitter housing is installed in Category 2.

Intrinsically Safe: Must be installed per drawing 50049892

Division 2: This equipment is suitable for use in a Class I, Division 2, Groups A, B, C, D; T4 or Non-Hazardous Locations Only.

The enclosure is manufactured from low copper aluminum alloy. In rare cases, ignition sources due to impact and friction sparks could occur. This shall be considered during Installation, particularly if equipment is installed a Zone 0 location.
If a charge-generating mechanism is present, the exposed metallic part on the enclosure is capable of storing a level of electrostatic that could become incendive for IIC gases. Therefore, the user/ installer shall implement precautions to prevent the buildup of electrostatic charge, e.g. earthing the metallic part. This is particularly important if equipment is installed a Zone 0 location.

ST 800/ ST 700 Series Pressure, ANALOG, HART/DE and FF/ PA Communications

1. Intrinsically safe installation shall be in accordance with
   a. FM (USA): ANSI/NFPA 70, NEC® Articles 504 and 505.
   b. CSA (Canada): Canadian Electrical Code (CEC), part I, section 18.
   c. ATEX: Requirements of EN 60079-14, 12.3 (See also 5.2.4).
   d. IECEx: Requirements of IEC 60079-14, 12.3 (See also 5.2.4).
2. ENTITY approved equipment shall be installed in accordance with the manufacturer's Intrinsic Safety Control Drawing.
3. The Intrinsic Safety ENTITY concept allows the interconnection of two ENTITY Approved Intrinsically safe devices with ENTITY parameters not specifically examined in combination as a system when:

   Uo, Voc, or Vt $\leq$ Ui or Vmax; Io, Isc, or It $\leq$ Ii or Imax; Ca or Co $\geq$ Ci + Ccable, La or Lo $\geq$ Li + Lcable, Po $\leq$ Pi. Where two separate barrier channels are required, one dual-channel or two single-channel barriers may be used, where in either case, both channels have been Certified for use together with combined entity parameters that meet the above equations.
4. System Entity Parameters:

   ST 800/ ST 700 Transmitter: Vmax Voc or Uo, Imax Isc or Io;
   ST 800/ ST 700 Transmitter: Ci + Ccable $\leq$ Control Apparatus Ca,
   ST 800/ ST 700 Transmitter: Li + Lcable $\leq$ Control Apparatus La.
5. When the electrical parameters of the cable are unknown, the following values may be used:

   Capacitance: 197pF/m (60 pF/ft)
   Inductance: 0.66µH/m (0.020µH/ft).
6. Control equipment that is connected to Associated Equipment must not use or generate more than 250 V.
7. Associated equipment must be FM, CSA ATEX or IECEx (depending on location) listed. Associated equipment may be installed in a Class I, Division 2 or Zone 2 Hazardous (Classified) location if so approved.
8. Non-Galvanically isolated equipment (grounded Zener Barriers) must be connected to a suitable ground electrode per:
   a. FM (USA): NFPA 70, Article 504 and 505. The resistance of the ground path must be less than 1.0 ohm.
   b. CSA (Canada): Canadian Electrical Code (CEC), part I, section 10.
   c. ATEX: Requirements of EN 60079-14, 12.2.4.
   d. IECEx: Requirements of IEC 60079-14, 12.2.4.
9. Intrinsically Safe DIVISION 1/ Zone 0 WARNING: SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR USE IN HAZARDOUS LOCATIONS.
10. Division 2/ Zone 2: WARNING: DO NOT OPEN WHEN AN EXPLOSIVE GAS ATMOSPHERE IS PRESENT.
11. NO REVISION OF THIS CONTROL DRAWING IS PERMITTED WITHOUT AUTHORIZATION FROM THE AGENCIES listed.
12. For release approvals see ECO # 0094464.

A5. Marine Approvals

American Bureau of Shipping (ABS)

Certificate Number: 14-HS1265317

ABS Rules: Rules for Conditions of Classification, Part 1 - 2014 Steel Vessel Rules 1-1-4/7.7, 1-1-A3, 1-1-A4 which Covers the following: Steel Vessels 4-6-2/5.15, 4-8-3/13, 4-8-4/27.5.1, 4-9-8/13; Offshore Support Vessels 4-8-3/13, 4-8-4/29.5.1, 4-9-8/13; High Speed Craft 4-6-3/9.1.1(a), 4-7-9/15.1; Rules for Conditions of Classification, Part 1 - 2014 Offshore Units and Structures 1-1-4/9.7, 1-1-A2, 1-1-A3

Bureau Veritas (BV)

Certificate Number: 39542/A0 BV

Requirements: Bureau Veritas Rules for the Classification of Steel Ships

EC Code: 41S

Det Norske Veritas (DNV)

Certificate Number: A-13982

Application/ Location Classes:

Temperature D Humidity: B

Vibration: A EMC: B

Enclosure: C

For salt spray exposure; enclosure of 316 SST or 2-part epoxy protection with 316 SST bolts to be applied.

Korean Register of Shipping (KR)

Appl. No: DLN-T0044-14

Lloyd's Register (LR)

Certificate Number: 14/60017

Application: For use in environmental categories ENV1, ENV2, ENV3 adn ENV5 as defined by Lloyd's Register Test specification No. 1, 2013

A6. Measurement Instruments Directive (MID)

CERTIFICATE Number: TC8395

ISSUED BY: NMI CERTIN B.V**.**

MECHANICAL CLASS: M3 **ELECTROMAGNETIC ENVIRONMENT:** E2 AND E3

AMBIENT TEMPERATURE RANGE: -25 °C TO + 55 °C **HUMIDITY:** CONDENSING

PRESSURE RANGE:

Unit	Pressure Range
STD820	0 to 1000 mBar
STD830	0 to 7 Bar
STA84L	0 to 35 Bar A
STG84L	0 to 35 Bar
STD870	0 to 100 Bar
STA87L	0 to 100 Bar A
STG87L	0 to 100 Bar

MINIATURE AND INDUSTRIAL THERMOCOUPLES

#1	SERIES [6, 7]
1	Thermocouple

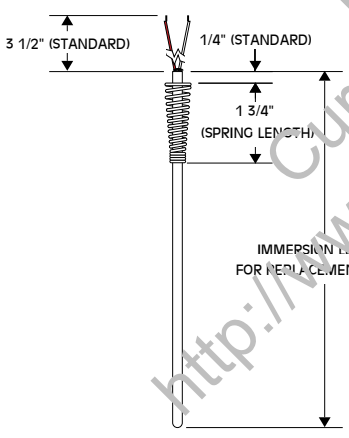
#2	TYPE [8, 9, 10]
–"	J, T, K, E, N, X (Other, specify)

#3	LIMITS OF ERROR [9]	ELEMENT CONSTRUCTION
1	Standard	Single
2	Standard	Dual
3	Special	Single
4	Special	Dual
X	Other, specify	

Note: For hollow tube sensors see pages 2-1 and 2-2.

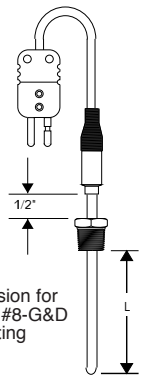
For fixed fittings and types S, C, D, B, N4, 6 and S4, 6 (symbol #8) this length normally equals the "A" dimension if a thermowell is used. (See Section 5)

#4	OUTSIDE DIAMETER [11]	CONDUCTOR SIZE (FOR BASE METALS ONLY) SINGLE (awg)	DUAL (awg)
*A	3/8"	13	16
B	1/4"	16	18
C	3/16"	19	20
D	1/8"	22	24
E	1/16"	28	30
*F	1/25"	32	34
X	Other, specify		
Z	N/A		



Note: IMS now offers sheath as small as .010 in diameter

#5	SHEATH MATERIAL [11]	MAX °F [2-8, 4-17]
H	304 Stainless Steel	1650
J	310 Stainless Steel	2100
V	STABALOY	2220
K	316 Stainless Steel	1650
M	Inconel 600	2100
C	Teflon coated SS	400
X	Other, specify	



[ ]BRACKETS INDICATE PAGE NUMBERS ON WEB OR FULL CATALOG FOR ADDITIONAL TECHNICAL INFORMATION WWW.JMS-SE.COM

#6	MEASURING JUNCTION [12, 13, 15]		
G	Grounded	*P	Reduced tip, grounded
U	Ungrounded	*Y	Reduced tip, ungrounded
E	Exposed (Isolated on dual)	*R	Gas/Air, exposed
I	Isolated	*S	Gas/Air, grounded
*J	Pointed tip, grounded	*T	Gas/Air, ungrounded
*K	Pointed tip, ungrounded	*V	Enlarged tip, grounded
*L	Weld pad, grounded	*W	Enlarged tip, ungrounded
*M	Weld pad, ungrounded	*X	Other, specify
N	Weld pad, removable grounded		**Note:** When selecting these options, a decription must be provided
*O	Weld pad, removable ungrounded		

#7	LENGTH (See sketches on Pg. 1-1, 2, 3 & 4 for lengths)
--"	Length in inches Note: If sensors requires a bend from the factory use page 2-1 to order.

Immersion for Symbol #8-E Spring

Immersion for Symbol #8-G&D Fitting

#8	STANDARD INDUSTRIAL ATTACHING DEVICE [1-3, 6- 13]
W	Fixed NPT ss fitting - double threaded
S	Spring loaded NPT ss fitting -double threaded
C	Spring loaded NPT ss w/ oil ring - double threaded
D	Spring loaded ss fitting - single threaded
B	Bayonet spring loaded assembly for thermowells and heads
*E	Adjustable spring over .250", .188", .125" sheath
F	Reverse mounted steel plug fixed for attaching head
G	Fixed stainless steel to sheath (See drawing to left)
*H	Compression fitting ss w/ ss ferrule
*I	Compression fitting ss w/ teflon ferrule
*J	Compression fitting ss w/ lava ferrule
*K	Compression fitting ss w/ nylon ferrule
*L	Compression fitting brass w/ brass ferrule
N4	4" Nipple-Union-Nipple (NUN4G1)
N6	6" Nipple-Union-Nipple (NUN6G1)
S4	4" Spring-Loaded-Union-Nipple (NU4G1)
S6	6" Spring-Loaded-Union-Nipple (NU6G1)
X	Other, specify or if more than 1 is needed
Z	Not applicable (no fitting required)

For materials other than SS, (ex: brass, carbon steel, etc.) Use X + material + letter designation

(SEE PAGE 1-3) FOR MORE NIPPLE OPTIONS.

*** Length is calculated without consideration of these attaching device. (See dwg on pg. 1-2)**

M	1/4”
P	1/2” (**Standard** w/ symbols W, S, C, and N in symbol #8)
O	3/4”
X	Other, specify
Z	N/A

#10 LEAD WIRE TYPE & LENGTH IN INCHES [SEE SECTION 7]

Z	No lead wires
1__”	Glass braid
2__”	PVC
3__”	Teflon
4__”	Hi-temp glass braid
5__”	Kapton
7__”	Bare wire
X__”	Other, specify

} Solid 20awg

8	PVC coil cord - **Standard** when using symbol #8-B and #13-R

Note: For non-stock stranded wire, add ”S” before symbol designation in this column. 24 awg or smaller may be used to accommodate some smaller diameters and flex armor extensions.

#11 ARMOR OR HEAT SHRINK [7-7] [16]

A	3/16” ID SS flex armor
B	3/16” ID SS flex armor PVC coated white
C	3/16” ID SS flex armor PVC coated black
D	1/8” ID SS flex armor
F	SS overbraid
G	Heat shrink / sleeving
H	Jacket to match primary insulation

J	Aluminum mylar shielded and jacketed to match primary insulation
X	Other, specify
Z	N/A

Note: Bell Springs are used for most wire extensions at transition. A special armor adapter is used when armor is longer than 60”.

#12 TYPE OF TRANSITION [16]

H	Heat shrink
S	Size on size
T	3/8” OD (**Standard**)
R	1/4” OD
X	Other, specify
Z	No transition

Note: For high humidity / moisture environments, ≤ 500˚F put a “2” after your selection.

* For high temperature at the transition area use an X + type of transition and maximum temperature. >500°F

#13 COLD END TERMINATION [SEE SECTION 6] PICK AS MANY AS APPLICABLE

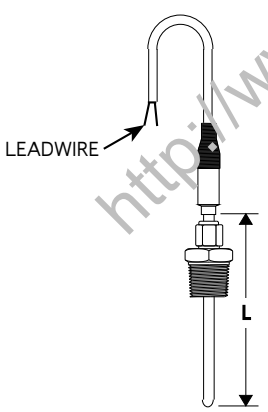
A	Bare ends
B	Miniature plug
C	Standard plug
D	Miniature jack
E	Standard jack
F	High temperature plug (< 800˚ F)
G	High Temperature jack (< 800˚ F)
I	Explosion proof Nema 7 head (6I / 6PT)
K	Spade lugs (6SL)
L	Aluminum head w/ hinged cover (6L / 6B4)
M	Aluminum head w/ screw cover & chain (6M / 6B4)
N	Cast iron head w/ screw cover (6N / 6B4)
O	Open terminal block (6M)

Note: For any other cold end termintion, use symbol X and describe using appropriate part numbers from section 6 in place of symbol #13.

Q	Black nylon Nema 4 head (6Q / 6B4)
R	High dome head (6R)
W*	Microphone style connector (6DA) -Male
8H	Isolated Transmitter
8N	Non IsolatedTransmitter
8S	AI-1500
8I	TempIR with Hart Protocol
8E	Intrinsically Safe TempIR
8D	TempIR/ Hart/ Intrinsically Safe
X	Other, specify

*Use double symbol here for matching female connectors. i.e. B/BB (male with matching female.

#14 OPTIONS USE ONLY IF APPLICABLE [INTRODUCTION]



TAGGING

1	Stainless steel tag
2	Plastic tag
3	Paper tag
4	Electroetch on probe

Note: You must always specify information required on tag

CALIBRATION

5	Calibrate at specified point(s). Corrections data will be provided for each point.
6	Calibrate specified temperature range. Corrections data will be provided for all temperatures within the range. **Note:** You must specify increments & range Ex. 0 to 300°F, 0.1° increments
7	CE Marking [Page XV]
8	Guide 17025 calibration
9	BAR CODE
Z	N/A

X = NUN4"G1

Drawing 3-A Internal View

An extension assembly may be needed to provide extra length for your sensor in order to extend your sensor head through insulation, or away from the heat of the process. This extension can include a pipe nipple only or a nipple-union-nipple or a nipple-union with a spring-loaded fitting.

Standard nipples and unions are 1/2" NPT and are available in galvanized or stainless steel. The union joins two nipples in an extension assembly and has a standard pressure rating of 150 pounds.

When a nipple-union-nipple or nipple only assembly is used and spring loading of the thermocouple element is required, there are two different methods of spring loading the sensor. The preferred method is to use the machined 1/2" by 1/2" NPT spring-loaded stainless steel fitting as one of the nipples (see symbol #8, S page 1-1). With this design, the probe is secured within the fitting and is mounted to the head in a rigid manner (see drawing #2 above). The appropriate part number for this assembly would be selected from symbols #6 and #9 from page 1-1 and 1-2, in addition to the symbols on this page. A cheaper method is a spring, mounted over the probe and loaded against the bottom of the terminal block in the head. With this method the probe is not supported within the nipple-union-nipple. It is secured only by the wires into the terminal block. (See drawings 1 & 3 above). We do not recommend that you use this method of spring loading if your probe is mounted horizontally.

When specifying this sensor extension, the nipple-union-nipple length tolerance is ± 1/4".

THERMOCOUPLES

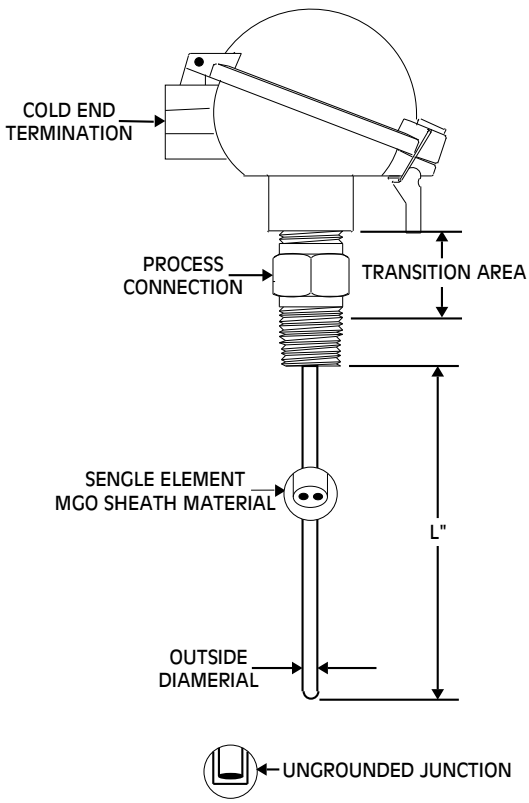
Thermocouples operate on the principle that when two dissimilar metals are joined at both ends and one of the ends is a different temperature, a measurable and repeatable EMF is produced.

The preferred design for JMS thermocouples is mineral insulated sheath. The high purity, hard packed magnesium oxide provides excellent insulation of the positive and negative wire conductors in relation to each other and to the outer metal material. Among the outstanding features of sheath are: (A) flexibility to bend or form to a radius = to 2x sheath diameter, (B) its rigidity to maintain size and shape after bending or straightening, (C) vibration nor shock has little affect on the sensor, (D) sheath withstands pressures upwards to 50,000 psi, and (E) sheath may be used in applications where temperatures may range from -400° to 3000°F depending on requirements and selection of materials.

COMPONENTS OF THERMOCOUPLES

HOT END

Outside Diameter



Thermocouples range in outside diameters from .010” to .500”. A general rule of thumb is the smaller the diameter, the quicker the response time. For additional information see page 1-13.

Sheath Material

JMS offers thermocouples in a wide variety of sheath materials, with 304 and 316 stainless steel being the most popular. Both temperature and environment should be taken into consideration when selecting your sheath material. See pages 1-1, 1-11 and 4-17 for temperature ratings of various materials. See page 2-8 for insulation characteristics.

Measuring Junction

The measuring junction is the sensitive portion of the thermocouple. Grounded junctions are the most frequently requested junctions. For a complete description of measuring junctions available and their advantages and disadvantages see page 1-12, 1-13.

TRANSITION AREA

This area is between the points when the sheath or tube ends and the cold end begins. The area includes the **actual transition point** (see pg. 1-16) and any process fitting or connections within these two points. Process connection **fittings** include compression fittings and 1/2” x 1/2” N.P.T. welded or spring loaded fittings. See page 1-2 for full selection of process connections. Metal parts and process connections can either be welded or brazed (silver solder), depending on the wall size of the material to which the parts are being attached.

COLD END

Leadwire Insulation

JMS offers a large selection of thermocouple leadwire. Insulations include fiberglass, PVC, teflon, kapton, high temperature fiberglass, and fiberglass with stainless steel overbraid or flexible armor. Additional information can be found in the “Thermocouple and RTD Wire” section. (Section 7)

Cold End Termination

This may be in the form of wires, plugs, or terminal heads. A partial list is given on page 1-2. See section 6.

4, one hour sessions training video. $1200.00 - Call for information.

THERMOCOUPLE GENERAL INFORMATION

Thermocouples consist of two dissimilar metals and provide a means of sensing temperature in a variety of processes. Temperature is the most widely measured process variable and its measurement is critical in many manufacturing processes. We at JMS manufacture temperature probes of exceptional quality to assure this measurement is accurate.

Thermocouples can be constructed in a variety of ways from flexible wires smaller than a human hair to rugged sheath one half inch in diameter. They can measure temperatures from -454°F to 4200°F.

Thermocouples are low-impedance devices that work by producing electro-motive forces and these EMF's are correlated to a temperature based on a curve specified for that particular thermocouple calibration. The EMF produced occurs due to temperature gradients along the wire and not at the junction. This phenomenon can be explained in three scientific theories called the Seebeck effect, the Peltier effect, and the Thompson effect.

Three laws of thermoelectric circuits that explain thermocouple behavior are **The Law of Intermediate Metals** which explains that a circuit's EMFs are algebraically additive unless the circuit is at a uniform temperature, **The Law of Homogeneous Metals** which indicates an EMF cannot be created unless another type of metal exists in the circuit and a temperature gradient exists.

The third law is the **The Law of Intermediate Temperatures**. If two dissimilar homogeneous metals produce a thermal EMF of X; it will remain at that number if a third material is introduced into the circuit, if both ends of that third material are at the same temperature.

The millivolt signal produced by the thermocouple is a very, very, very low level signal. Thus, transmitting this signal over a long distance may be difficult if any extraneous "noise" is introduced into the system. This noise may cause errors in the EMF signal. Shielded lead wire should be used in areas with excessive "noise" to help eliminate the problem.

The lead wire that extends from the thermocouple must match the calibration of the thermocouple. This lead wire continues to transmit the signal from the thermocouple to the instrument, and as long as it is one homogeneous metal, it does not produce an EMF along that length even if it does experience temperature gradients.

The output of a thermocouple depends on the magnitude of the temperature difference between the measuring junction and the reference junction. The reference junction is the cold end to which the thermocouple is connected. While the hot measuring junction is stable at a given temperature, the output of the point at which the reference junction is made must be compensated for in the instrumentation. This is accomplished through "cold junction Compensation." The temperature of the cold junction is measured and calculated into the overall EMF signal to obtain the accurate hot junction temperature, or the temperature of the process.[2]

[2]Benedict, R.P. Fundamentals of Temperature, Pressure and flow Measurement, Second Edition, Wiley, New York (1977).

THERMOCOUPLE POINTS

1. A thermocouple produces an EMF based on the composition of the two dissimilar metals only, irregardless of the dimension or length of the conductors.

2. No voltage is produced at the thermocouple junction, only in those portions of the sensor that are in a temperature gradient.

JMS has access to several papers on noise and its effect on instruments. Call us and we will mail or fax you a copy.

4, one hour sessions training video. $1200.00 - Call for information.

THERMOCOUPLE TYPE INFORMATION

JMS offers thermocouples and wire in the following types. Listed below are suggested criteria to consider in selecting the desired type for your application. Contact JMS Southeast if additional information is required.

(J)–Iron vs Constantan (Most Common)

May be used in vacuum, oxidizing, reducing, and inert atmospheres. Heavier gauge wire is recommended for long term life above 1000°F since the iron element oxidizes rapidly at these temperatures.

(T)–Copper vs Constantan (Most Common Cold)

May be used in vacuum, oxidizing, reducing, and inert atmospheres. It is resistant to corrosion in most atmospheres. High stability at sub-zero temperatures and its limits of error are guaranteed at cryogenic temperatures.

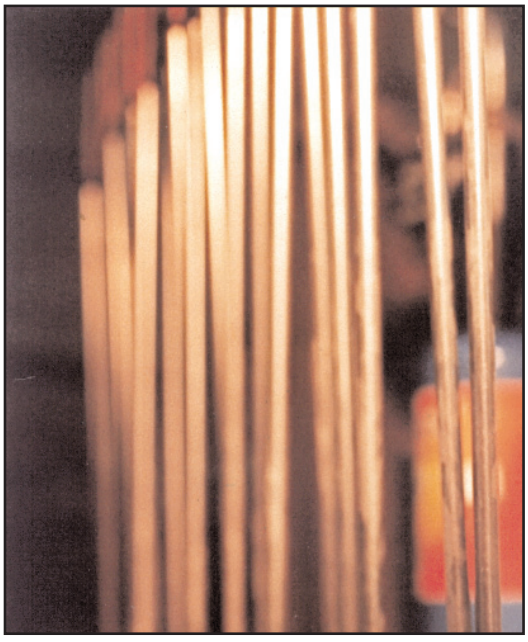
(K)–Chromel vs Alumel (Most Common Real Hot)

Recommended for continuous use in oxidizing or inert atmospheres up to 2300°F (1260°C), especially above 1000°F. Cycling above and below 1800°F (1000°C), is not recommended due to EMF alteration from hysteresis effects. Should not be used in sulfurous or alternating reducing and oxidizing atmospheres unless protected with protection tubes. Fairly reliable and accurate at high temperatures.

(E)–Chromel vs Constantan

May be used in oxidizing or inert atmospheres, but not recommended for alternating oxidizing or inert atmospheres. Not subject to corrosion under most atmospheric conditions. Has the highest EMF produced per degree than any other standard thermocouple and must be protected from sulfurous atmospheres.

(S,R)–Platinum vs Platinum Rhodium (Most Common Real, Real Hot)



Recommended for use in oxidizing or inert atmospheres. Reducing atmospheres may cause excessive grain growth and drifts in calibration.

(N)–Nicrosil vs Nisil (New ... Better Than "K")

May be used in oxidizing, dry reducing, or inert atmospheres. Must be protected in sulfurous atmospheres. Very reliable and accurate at high temperatures. Can replace Type K thermocouples in many application.

(C)–Tungsten 5% Rhenium vs Tungsten 26% Rhenium

Recommended for use in vacuum, high purity hydrogen, or pure inert atmospheres. May be used at very high temperatures (2316°C), however, is inherently brittle.

K[A]	-200 to 0	-328 to 32	±2.2 or ±2		[B]	

[A] Thermocouple and thermocouple materials are normally supplied to meet the tolerances specified in the table for temperatures above 0°C. The same materials, however, may not fall within the tolerances given for temperatures below 0°C in the section section of the table. If materials are required to meet the tolerances stated for temperatures below 0°C the purchase order must so state. Selection of materials usually will be required.

[B] Special tolerances for temperatures below 0°C are difficult to justify due to limited available information.

Note: The °F tolerance is 1.8 times larger than the °C tolerance at the equivalent °C temperature.

Selection of the optimum type of thermocouple and auxiliary components for a pyrometric system is necessarily based on a number of variables or factors of the application. The temperature range, EMF output, accuracy required, resistance to atmospheric conditions, pressure and shock are typical thermocouple systems for a given application.

The following technical information is intended to serve only as a guide for thermocouple selection. Any recommendation stated is based on past practices and experience, and no guarantees, implied or otherwise, are made as to optimum operation conditions.

Although some of these materials will operate at higher temperatures than shown on the chart, they represent what is generally conceded as the maximum reliable operating temperature.

4, one hour sessions training video. $1200.00 - Call for information.

ELEMENT CONSTRUCTION

JMS Southeast offers the choice of single, dual, or triple element thermocouples. A single element thermocouple is used when a single signal is required. If two inputs are required, we offer dual element sensors. Dual isolated elements are frequently used for two different monitoring systems such as a recorder and controller. Although not as commonly used as single or dual elements, JMS also manufactures triple element sensors for applications that require three inputs. It is possible to parallel outputs from a thermocouple to any number of instruments, but this is not a recommended practice. The use of dual or triple elements should also specify isolated junctions. See page 1-1.

SUGGESTED UPPER LIMIT FOR OUTSIDE DIAMETER (SINGLE ELEMENT) ˚C (˚F)

NEW!

4, one hour sessions training video. $1200.00 - Call for information.

For high temperature applications 1000°F to 2300°F, new proprietary materials have been developed to perform better than the alloys used in the past.

V = STABALOY: “...can be used at ultra high temperatures for prolonged periods with little degradation to the thermocouple wires.”

MEASURING JUNCTION

GROUNDED JUNCTION

The **grounded** thermocouple junction is an integral part of the thermocouple sheath tip.

Advantages:

- fast response time in relation to ungrounded and isolated junctions.
- protects the wires from environmental chemicals and corrosives.
- prolongs the operational life of the thermocouple. Longer lifespan than the exposed junction thermocouple.
- it is recommended for high pressure applications.
- it is the least expensive construction.

Disadvantages:

- thermal expansion of sheath material may differ from element to cause mechanical stress and work hardening of metals.
- ground loops may cause interference with instruments.
- faults in insulation are more difficult to detect.

UNGROUNDED JUNCTION

The **ungrounded** thermocouple junction is electrically insulated and electrically isolated from the outer sheath material. In a dual ungrounded thermocouple, one common junction is electrically insulated from the outside sheath.

Advantages:

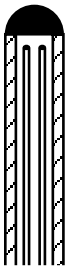
- the thermocouple junction is isolated from the ground.
- defects in the MgO insulation can be detected by measuring resistance from loop to sheath.
- long term drift under cycling conditions is minimized.

Disadvantages:

- response time is usually slower than grounded thermocouples.
- more expensive than grounded thermocouples.

Dual exposed junctions are common, except for 8 awg

EXPOSED JUNCTION



The **exposed** thermocouple junction extends beyond the protective metallic sheath.

Advantages:

- recommended for measurement of noncorrosive static gas, or air.
- very fast response time, faster than grounded junction.

Disadvantages:

- cannot be used in an environment with a high percentage of solids, high pressure, or flowing material since the junction is exposed to this environment.

ISOLATED JUNCTION

Isolated thermocouple junctions are used in a dual or triple thermocouple when the junctions are isolated from the outer sheath material as well as from each other.

Advantages:

- the elements are insulated from ground.
- performs better than ungrounded or grounded junctions in a thermal cycling environment.

Disadvantages:

- slower response time than a grounded dual thermocouple.

*For tip sensitivity information, see page 3-8.

MEASURING JUNCTION TYPICAL RESPONSE TIME

SHEATH O.D.	MEASURING JUNCTION	*RESPONSE
.040 (1/25”)	Grounded	.07
	Ungrounded / Isolated	.11
.063 (1/16”)	Grounded	.09
	Ungrounded / Isolated	.28
.125 (1/8”)	Grounded	.34

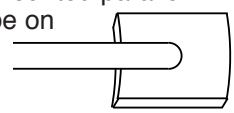
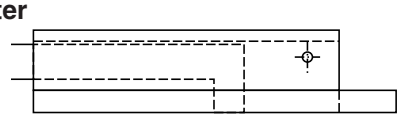
.188 (3/16”)	Grounded	.7
	Ungrounded / Isolated	2.6
.250 (1/4”)	Grounded	1.7
	Ungrounded / Isolated	4.5
	Exposed	.09

*Response time in seconds. The above table is the average of several thermocouples tested in each category. Tests were performed during a step change from room temperature to boiling water. The above indicates time required to show 63.2% of a temperature change. No process we know of matches these conditions. Please use this data as a means of comparing sheath size and junction only. Actual response time in your process can be simulated by our laboratory. Please call us for help.

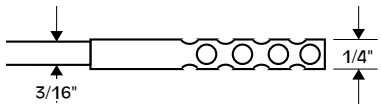


SPECIAL JUNCTIONS

To specify the following special junctions in the thermocouple part number, you may use the appropriate symbol below in place of symbol #6 on page 1-1.



SYMBOL	SPECIAL JUNCTIONS
J	Pointed tip grounded
K	Pointed tip ungrounded See page 1-15
L	Weld pad grounded (standard pad size 1” x 1” x 1/8” thick)
M	Weld pad ungrounded (standard pad size 1” x 1” x 1/8” thick See page 1-14
N	Weld pad, removable grounded (standard pad size1” x 2 1/4” x 1/8” thick)
O	Weld pad, removable ungrounded (standard pad size 1” x 2 1/4” x 1/8” thick See page 1-14
P	Reduced tip grounded (specify overall length, reduced tip length and outside diameters in description)
Q	Reduced tip ungrounded (specify overall length, reduced tip length and outside diameters in description) See page 1-15
	See page 1-15
R	Gas/Air exposed
S	Gas/Air grounded
T	Gas/Air ungrounded
F	Ultra fast response (40 awg kapton wire) TC only.
V	Enlarged tip grounded (specify overall length, enlarged tip length and outside diameters in description)
W	Enlarged tip ungrounded (specify overall length, enlarged tip length and outside diameters in description) See page 1-15



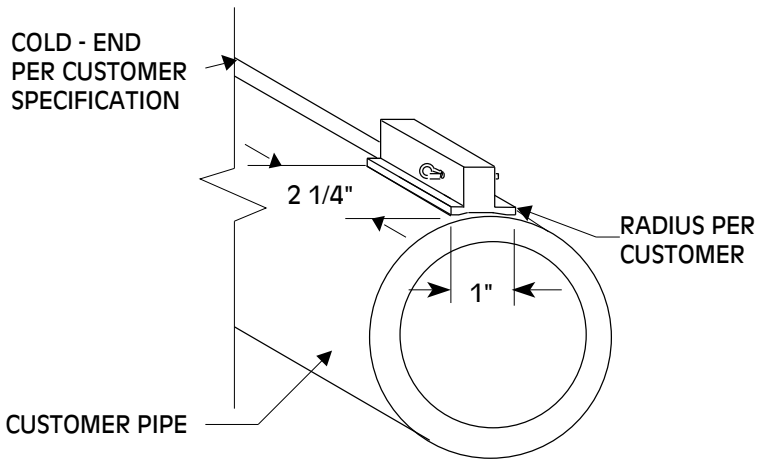
EG: 1N1DVX... X=L 2" TUBE If curved, use X in symbol #6 and specify pipe / tube diameter and wether the sensor is mounted parallel or perpendicular to the tube on which it is to be mounted.

Specify Pipe / Tube Diameter

TUBE-SKIN SENSORS

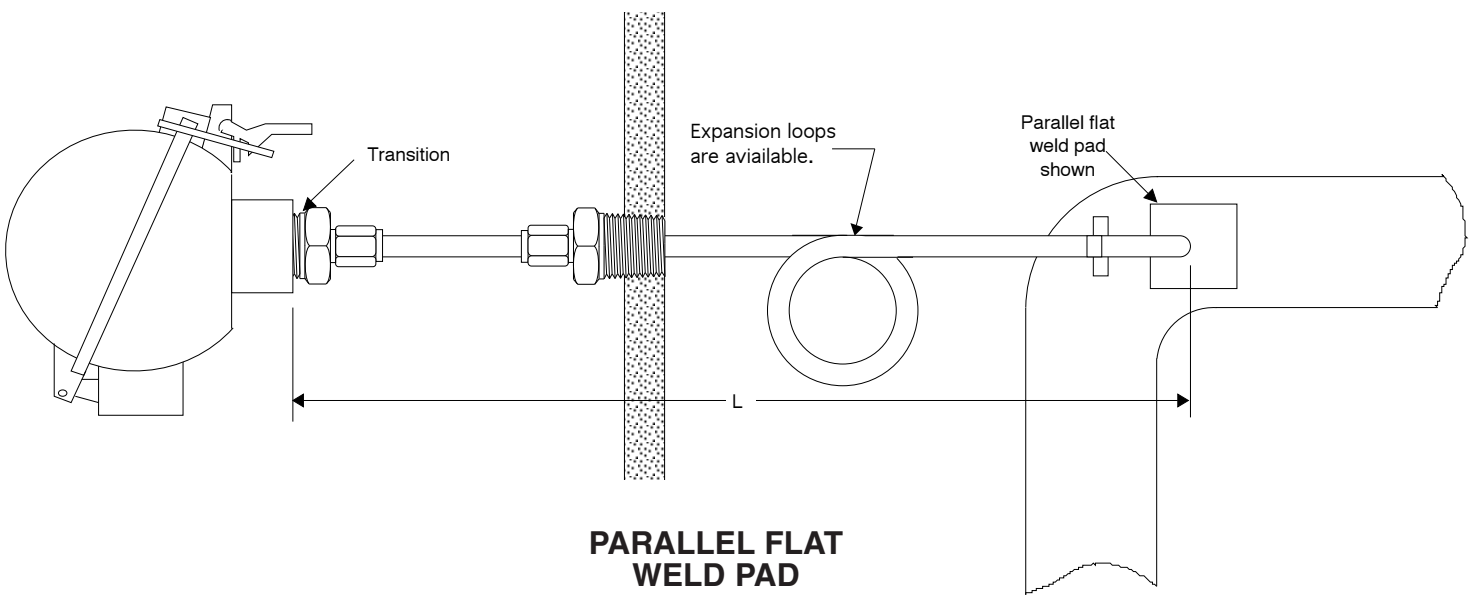
Tube skin sensors are designed for measuring the temperature of tube walls in chemical power and petroleum industries. Power houses use this type of thermocouple on boiler and superheater requirements. The measurements are used to determine the fatigue of the tube material. For tube skin thermocouples, JMS Southeast uses sheath material which allows for proper insulation, expansion loops, and easy installation. The weld pad should match the tube material and may be used in upper temperature ranges to 2100°F. The standard weld pad dimensions are 1" x 1" x 1/8" thickness. The removable weld pad dimensions are 1" x 2 1/4" x 1/8" thickness. The pads can be curved to fit the radius of your pipe.

On installation, we recommend attaching weld pads to a surface for good thermal conduction. Avoid any currents or still places of flow in your process.



When mounting the tube skin through a furnace wall, insert the probe and mount it into the wall with a compression fitting, then slide another compression fitting onto the probe to secure the head to the cold end.

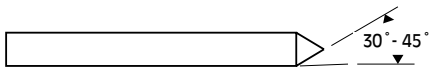
If this type of mounting is required, the extra compression fitting should be ordered as an accessory piece. The unit will be shipped with the head disassembled.



Any other mounting configuration can be specified by a drawing or in the part number description. These fitting options are listed in the ordering symbols below.

Note: Proprietary designs are available for removable tubeskin thermocouples. Call for assistance.

4, one hour sessions training video. $1200.00 - Call for information.



REMOVABLE WELD PAD

PARALLEL FLAT WELD PAD

SPECIAL JUNCTIONS

POINTED TIP

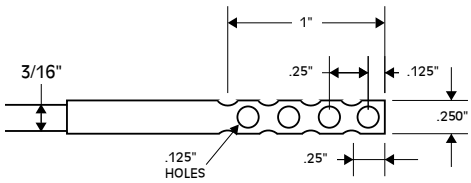
The pointed tip sensor actually acts like a “needle”, and can be inserted into an item to measure its temperature. The angle of the point is approximately 30° - 45°.
This type of probe is most commonly used in the food processing and pharmaceutical industries.

This sensor can be manufactured in Types J, K, T, E, and N thermocouple calibration. Any cold end details can be selected from those listed on page 1-2 .

The conical point on this sensor is designed to penetrate into soft and semi-frozen objects. It is made from rugged stainless steel and can be manufactured with a durable plastic handle for hand held penetration and measurement, if needed.

REDUCED TIP

The reduced tip sensor is used to yield a quicker response time. The smaller diameter probe at the tip provides less mass at the sensing end, thus a faster response time.



Specify desired diameter needs, large and reduced, and the lengths of both: i.e., X=Reduced tip, 1/4” x 5”, 1/8” x 1”. This sensor can be used for immersion into air or liquids. Care should be taken to assure high velocity flow and/or pressure does not exist if using a small diameter reduced tip sensor. This sensor can be manufactured in any calibrations. Cold end details can be selected from page 1-2.

ENLARGED TIP

The enlarged tip sensor is usually used for better thermal transfer in an old well. Specify desired diameter needs, reduced and large, and the lengths of both: i.e., X=Enlarged tip, 1/4” x 6”, 1/2” x 8”. The cold end details can be specified from page 1-2 of the JMS catalog. The standard material used is 316SS.

GAS / AIR TIP

The gas / air section of the probe is made to cover the exposed sensor measuring junction to protect the junction while still allowing air to flow thru the holes. JMS has a standard pattern of hole size and spacing as shown in the drawing above.

This stainless steel cover over the junction acts as a radiant energy shield to protect the measuring junction from radiant heat which may be emitted from a flame or heater in the process. The thermocouple tip is still exposed to air flow for fast measurement. This type of probe can be inserted into duct work, grills, and air vents.
For RTD’s, a type E sensor (page 3-1) is either exposed (bare) or enclosed in a 1/8” hollow tube for moisture protection. An ultra fast response type is also available.

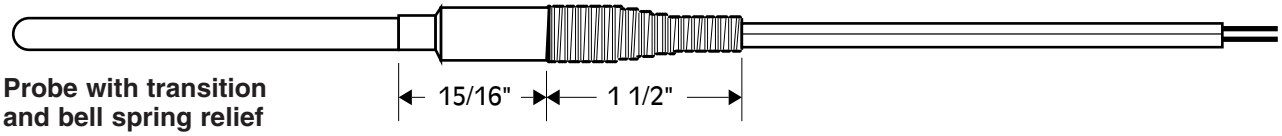
POTTING COMPOUNDS

JMS Southeast utilizes several potting compounds in the manufacturing of our temperature sensors. Our standard is a moisture impermeable epoxy which is black in color. Its recommended upper temperature limit is 500°F.

The potting compound used in higher temperature applications is a cement which is white in color. It is not as moisture impermeable as the lower temperature epoxy compound, yet it can withstand temperatures to 1750°F. It has a lower mechanical strength than the epoxy compound, but is the recommended choice for high temperature applications. Use an X in symbol #12 to utilize a higher temperature transition. The end of the part # to include the highest temperature (°F) the transition will see + type of transition, ie. X=650T .

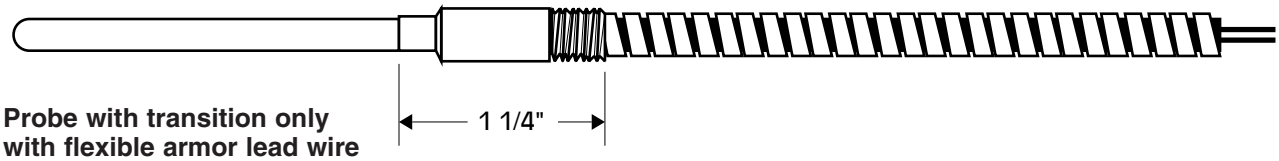
Through the JMS Southeast sensor ordering information, we determine the maximum temperature that the potting will be exposed to and select the appropriate potting compound.

JMS provides special hermetic sealing from moisture for those sensors used in high humidity / moisture or total immersion environments. Any moisture penetrating the transition will kill the integrity of the electrical property of the sensor. Our special hermetic sealing will prevent this in any environment. Use a “2” after your selection for symbol #12 on page 1-2.



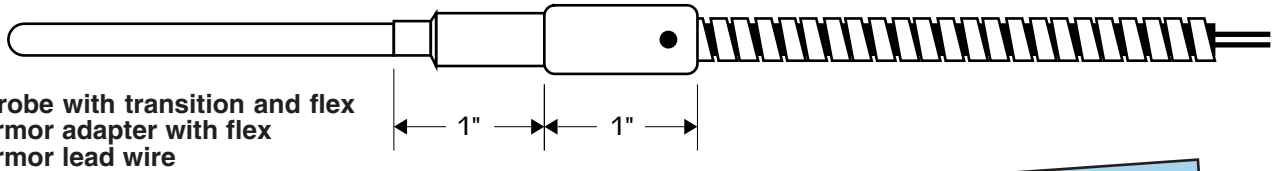
When shipping by air, there is the distinct possibility that the sensor(s) will be exposed to varying pressure, humidity and temperature conditions. This can and does cause some sensors to admit moisture into the insulation. We have experienced a few cases in which the sensor passed the ASTM tests performed here only to fail the same tests after shipping by air. Our recommendation is that you specify special shipping containers in those instances including the use of desiccants, or other moisture prevention devices. Hermetic sealing may be a necessary component as well.

THERMOCOUPLE TRANSITIONS



The transition contains the braze joint that connects the sheathed thermocouple conductors to the lead wire. The stainless steel joint supports and contains the potting compound used to encapsulate the connection.

The standard size of JMS transition is .375 outer diameter by 3/4” long, tapering down and extending over the thermocouple sheath material for 1/4” . The outside diameter that tapers down onto the sheath is approximately .055” larger than the thermocouple sheath diameter.



A transition may be used to provide support for lead wire. A bell spring relief may also be used which will extend the rigid length of the probe by approximately 1”. The transition and bell spring relief extends the length for a total of approximately 2 1/2”.

Probe with transition and bell spring relief

Probe with transition only with flexible armor lead wire
(Standard on low temp. transition, single elements.)

Probe with transition and flex armor adapter with flex armor lead wire

4, one hour sessions training video. $1200.00 - Call for information.

THERMOCOUPLE OPERATION AND INSTALLATION INSTRUCTIONS

Thermocouples are installed by means of compression fittings, welded 1/2" x 1/2" NPT fittings, or bayonet fittings.

Follow these instructions for installation of a thermocouple with a 1/2" x 1/2" NPT fitting:

(1) Insert thermocouple into process hole
(2) Tighten probe into place by turning probe into threaded connection.

When installing a spring-loaded sensor, the wires should be disconnected from the terminal block to prevent twisting and shorting during installation.

INSTALLATION:

Place thermocouple in area not too close to heating element or direct flame.

When measuring very high temperatures, install thermocouple vertically, if possible, to avoid protection tube element sagging.

Always use thermocouple extension wire to correlate with calibration of thermocouple and instrumentation being used.

Install thermocouple away from AC power lines, preferably more than one foot away.

Do not run thermocouple wires in the same conduit with other electrical wires.

Apply lacquer or silicon resin to screws to prevent effects of vibration and oxidation.

ELECTRICAL:

Make sure the extension wire is clean so a good electrical connection will result at the terminal block. Connect the positive extension wire to the positive thermocouple wire and the negative extension wire to the negative thermocouple wire. Wires are color coded for identification as follows, notice that the negative leg is always red.

	THERMOCOUPLE TYPE			EXTENSION WIRES		
	POS.	NEG.	OUTER JACKET	POS.	NEG*	OUTER JACKET
E	purple	red	brown	purple	red	purple
J	white	red	brown	white	red	black
K	yellow	red	brown	yellow	red	yellow
R	N/A	N/A	N/A	black	red	green
S	N/A	N/A	N/A	black	red	green
T	blue	red	brown	blue	red	blue
N	orange	red	brown	orange	red	orange

See Page 1-9 for IEC color codes for primary conductor and color codes. The outer jacket matches the primary conductor unless specified for an intrinsically safe area, in which case all outer jackets are blue.

*A tracer having the color corresponding to the positive extension may be used on the negative wire code. Occasionally, it is necessary to determine thermocouple polarity in the field. The above characteristics are helpful, along with the information on the following page.

4, one hour sessions training video.
$1200.00 - Call for information.

TYPE E-The negative wire has lower resistance in ohms per foot than the positive element for the same size wire.

TYPE J-The positive element is frequently rusty and is magnetic. It has a lower resistance in ohms per foot for the same size wire.

TYPE K-The negative element is slightly magnetic. It has a lower resistance in ohms per foot for the same size positive wire.

TYPE R or S-The negative wire is softer. The positive wire has a lower resistance in ohms per foot for the same size wire.

TYPE T-The negative wire is silver in appearance. The positive wire has a lower resistance in ohms per foot for the same size wire, and is usually copper colored.

TYPE N-The positive leg has a higher resistance in ohms per foot for the same size wire.

Note: When in doubt, twist the wire together, and connect opposite ends to a volt meter. Heat the twisted end with a cigarette lighter. If the volts go up - polarity is correct ...

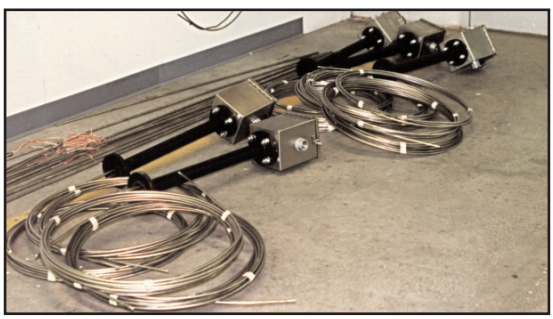
OPERATION:

The temperature of the connection head should be kept as near room temperature as possible to avoid errors due to the extension wires. The maximum recommended temperature at the terminal block is 400°F.

MAINTENANCE:

The quality and frequency of calibration checks must be determined for each individual application by noting the decalibration rate of each thermocouple at individual installations. Thermocouples will deteriorate due to contamination from their environments. Calibration is usually made by comparison with a working standard. The thermocouple may be removed from its installation and checked in an electric furnace with the working standard; however, check the thermocouple in its installed position and location if possible. See page VI.

Return thermocouples that were removed for tests to the same location and immersion depth for reliable and repeatable readings.



Do not use a thermocouple to measure a very low temperature if it has been used to measure a very high temperature previously.

Make sure protection tubes and thermowells are in good condition when protecting thermocouples with them.

Do not run a single thermocouple to two different instruments. This can result in instrument imbalance. A dual isolated thermocouple should be used instead.

STORAGE:

Store in a clean dry place. Avoid stacking probes in areas of excessive moisture or humidity (ie: dripping, condensation). Special packing with desiccant can be specified. (See page II)

TYPE N THERMOCOUPLE VERSUS TYPE K THERMOCOUPLE IN A BRICK MANUFACTURING FACILITY

The following paper was presented by Barbara Hudson, former General Manager of JMS Southeast, Inc., at the Brick Plant Forum Convention at Clemson University in Clemson, South Carolina.

ABSTRACT:

The brick industry historically has had the option of a Type K thermocouple, which is inaccurate yet inexpensive, versus Type R and S thermocouples which are very expensive yet accurate. This article investigates the Type N thermocouple which has been developed as a substitute for the Type K thermocouple in the 32°F to 2300°F temperature range.

TYPE K VERSUS TYPE R OR S THERMOCOUPLE

Through the years, many changes have occurred in the firing of structural clays including gas, oil, and sawdust combustion. Yet, the temperature measuring methods has remained the same as far as thermocouple configurations are concerned. Throughout history, a Type K thermocouple has been used in an area which was thought of as being "non-critical". The Type R or S thermocouples (platinum-rhodium) have been used in the past in "control" areas. The reasons for these uses include: Type K thermocouples, but are also less stable and less accurate. Type K thermocouples are easily attainable, however, and widely accepted in all industries.

The reasons for the instability in Type K thermocouples are due to some inherent properties in the chromel/alumel material. One problem that occurs with this thermocouple is an effect called short-range ordering. It occurs in a temperature range of about 500°F to 1020°F when nickel and chromium atoms in the chromel leg tend to form an ordered crystalline structure. The ordering produces a different metallurgical structure and if a temperature gradient exists, an erroneous EMF is produced.

Another shortcoming of Type K thermocouples is the hysteresis effect that occurs when a Type K thermocouple is cycled up and down in temperatures above and below 1800°F. The re-ordering of the crystalline structure changes with each cycle. After the first pass above this temperature, the Type K temperature indication will probably be accurate. However, with each additional cycle after this one, the error will increase more and more. The Type K thermocouple also experiences a cumulative drift after a period of time at temperatures above 1650°F. Finally, this thermocouple experiences a physical defect called "green rot" which is caused due to preferential oxidation of the chromel leg.

Even with these problems of instability and lack of longevity in Type K thermocouples, they are widely used and accepted in the brick industry as well as other industries. This is due to the fact that they are inexpensive and the choices have been limited in the past to a thermocouple that could replace Type K at a comparable price.

The platinum-rhodium thermocouples (Type R and S) on the other hand have been used as control thermocouples in the past. They are much more stable than the Type K thermocouples, but much more expensive also. They can be ten times the expense of a Type K thermocouple. Type R or S thermocouples do, however, after a period of time at elevated temperatures, experience a drift due to platinum migration.

In essence, for temperature measurement in a brick kiln, we have a fairly accurate option at a high cost versus an unstable and "short life" option at a reasonable cost. A compromise was needed!

TYPE N THERMOCOUPLES

Noel Burley, from Australia, began extensive research on a type N thermocouple (nisil/nicrosil). The composition of this thermocouple is the following: Nicrosil-NI-14.2%, Cr-1.4%, Si and Nisil-Ni-4.4%, Si-.1%, Mg. Noel Burley's research showed that the Type N thermocouple exhibited thermal stability above 1650°F, while Type K thermocouples showed a

gradual and cumulative drift. He also showed the Type N thermocouple showed no short-term change due to crystal restructuring that occurred with the Type K thermocouple. Also, the Type N had superior resistance to oxidation (no "green rot") and could replace the Type K throughout its entire range of 32°F-2300°F. Its cost is about the cost of a Type J thermocouple. Due to this information, we decided to experiment with the Type N thermocouple in a brick manufacturing environment.

EXPERIMENTATION:

Frank Todd and Frank Todd, Jr., at Fletcher Brick were kind enough to allow us to do some experimentation in their facility. We were restricted to a short time frame, so we needed accelerated life data on comparisons between a Type K and Type N thermocouple. In communication with Fletcher Brick, a top to bottom and side to side temperature gradient was suspected in their tunnel kiln. They desired better monitoring to attain better control, thus better brick. If they were to go to platinum/rhodium thermocouples as side port monitoring sensors, the thermocouples alone would have cost in excess of $6,000 not including the data logger needed for data collection. Due to accelerated life data needed, we used 20 gauge thermocouples realizing they would deteriorate quickly. Stage 1 of our experimentation included manufacturing 10 dual thermocouples which consisted of one 20 gauge Type K and one 20 gauge Type N thermocouple in each sensor. These were installed in side ports of the kiln and ran for 30 days. The Type R thermocouples existed in the top center of the kiln as control thermocouples. All monitoring thermocouples were connected to a 40 channel data logger which printed the temperature of all sensors every six hours. This data was converted to actual temperatures for the Type N thermocouples and was compared to the control Type R sensors for kiln changes. After all the data was compiled, the drift was plotted for four Type K thermocouples. The drift of the Type K thermocouple was difficult to predict. All four sensors drifted in non-repeatable and inconsistent patterns.

The Type N readings were graphed and they also failed within the 30 day period as was predicted since 20 gauge wire was used. The drift, however, was more predictable. This was only a preliminary stage of our experimentation. We will continue our work with the 14 gauge Type N versus Type K thermocouples.

CONCLUSION:

In conclusion, Type N thermocouples can be used in all areas of the brick; i.e. traveling thermocouples, air conditioning vents, kiln control, monitoring sensors, and drying sensors.

Research has shown Type N thermocouples have better thermal stability than Type K in the temperature range of 1200°F-1400°F, which is the pre-heat zone where carbon burn-out occurs.

Also better control can be obtained with a Type N thermocouple at the quartz inversion point of 1050°F.

Two or three different types of thermocouples used in a single plant within the Type N temperature range of 32°F-2300°F can be replaced by the Type N thermocouple. This would standardize the plant with one type of thermocouple enabling the use of one type of controller, one type of data logger, etc.

This thermocouple is also ASTM certified. It has been given a color code of orange/red. It is listed in most thermocouple manufacturers catalog. We at JMS Southeast, Inc., will continue doing research with the Type N thermocouple in structural clay firing applications.

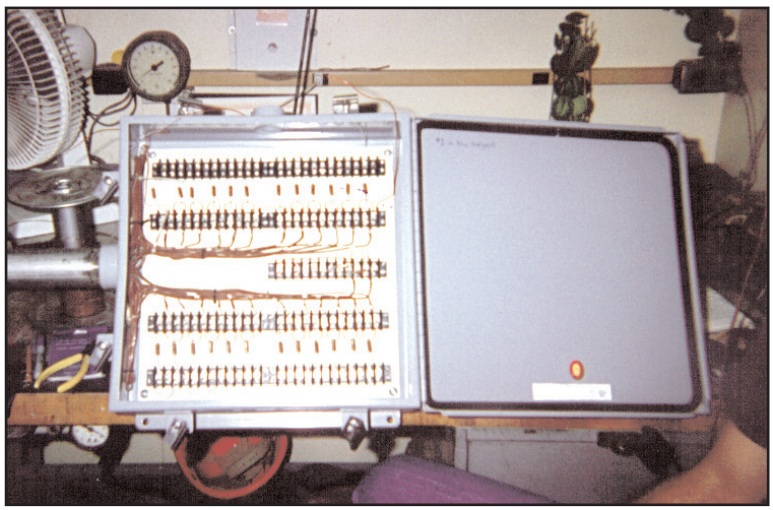
TYPE N THERMOCOUPLE GENERAL INFORMATION

COMPOSITION: Nisil/Nicrosil

Nisil: Ni-4.4 wt%
Si-0.1 wt%
Mg

Nicrosil: Ni-14.2 wt%
Cr-1.4 wt%
Si

	Color Code	Magnetic
Nisil: (N)	Red	No
Nicrosil:(P)	Orange	No



ACCURACY:

32°F to 2300°, ± 4° or .75% of temperature reading. Can replace Type “K” thermocouples throughout entire range.

Type “N” is available in beaded assemblies or sheath material. Extension wire and other temperature accessories such as meters, controllers, transmitters, etc., are also available.

ADVANTAGES:

1. Superior thermal stability at temperatures over 1650°F, while other thermocouples such as Type “K” exhibit much greater cumulative drift.
2. Superior thermal stability in that no short term change occurs due to the crystal restructuring.
3. Superior resistance to oxidation. (No green rot.)
4. Does not exhibit hysteresis effect as the Type “K” thermocouple does.

MATERIAL SELECTION INFORMATION

The following information is a guide line for selecting thermocouple, RTD and thermowell materials based on the process fluid. Factors such as catalytic reaction, contamination and electrolysis are taken into consideration. However, in many cases there are even more variables which must be examined.

These suggestions are to be used only as guide lines and are based on the most economical material selection. JMS Southeast will not take any responsibility if these recommendations are not satisfactory for specific applications. Consult JMS Southeast for special applications and our engineering department will assist you in your selection.

SUBSTANCE	CONDITIONS	RECOMMENDED METAL

PLASTICS SENSORS

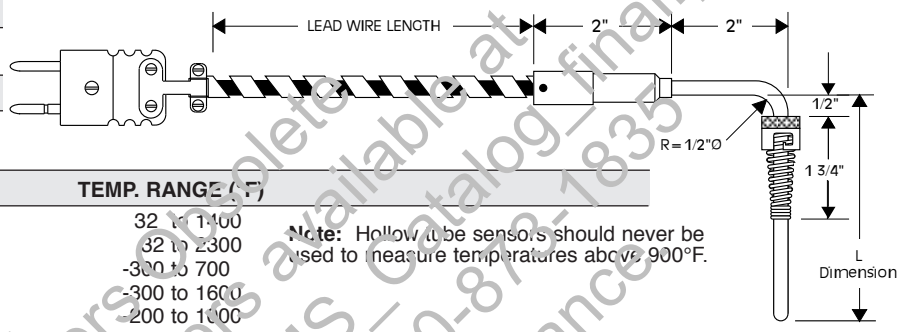
BAYONET TEMPERATURE SENSORS

Bayonet style attachments are the most common in Plastics Processing. JMS has adapted this useful and safe design to other industrial sensors to utilize the best features of both.

Our standard design and most commonly used is the Adjustable Bayonet attachment device which incorporates a chrome plated brass cap with a 303 stainless steel spring. The spring fits like chinese handcuffs around the appropriately sized sensor and remains in position until such a time as the user adjusts it. This enables the same sensor to be used for many different applications in the same facility. It also makes for lower inventory levels which your accountant will love.



The other attachment devices we make for your sensors are standard in the industry. For those "Old Dogs" who refuse to try something innovative we still offer the fixed bayonet design. The length of this sensor cannot be changed and will only go in the hole it was specifically built to fit.

#1	SERIES
2	Plastics Sensors

#2	DESIGN [8]
M	MgO insulated (**SWAGED**)
H	Hollow tube

#3	TYPE	TEMP. RANGE (°F)
J	Iron/Constantan	32 to 1400
K	Chromel/Alumel	32 to 2300
T	Copper/Constantan	-300 to 700
E	Chromel/Constantan	-300 to 1600
3	100Ω Platinum RTD (.00385 alpha, 3 wire)	-200 to 1000
X	Other, specify	

Note: Hollow tube sensors should never be used to measure temperatures above 900°F.

ADJUSTABLE BAYONET

#4	OUTSIDE DIAMETER
C	3/16" (.188")
D	1/8" (.125")
B	1/4" (.250") (**SWAGED** only)
X	Other, specify

Note: 304 SS standard sheath material.

#5	LIMITS OF ERROR	ELEMENT CONSTRUCTION
1	Standard	Single
2	Standard	Dual
3	Special	Single
4	Special	Dual
X	Other, specify	

Special limits RTD's are JMS Class A tolerance (page 3-8)

#6	CONSTRUCTION
S	Straight
4	45° bend
9	90° bend
X	Specify bend

Note: 1/2" radius bends are standard. Other radius may be specified but they may deform the diameter of the tube at the bend.

[ ]BRACKETS INDICATE PAGE NUMBERS ON WEB OR FULL CATALOG FOR ADDITIONAL TECHNICAL INFORMATION WWW.JMS-SE.COM

SWAGED ONLY

#7	MAXIMUM TEMPERATURE AT WHICH TIP WILL BE EXPOSED	
A	<100°C (212°F)	=2 PVC*
B	<200°C (392°F)	=3 Teflon*
C	<285°C (550°F)	=5 Kapton*
D	<482°C (900°F)	=1 Fiberglass*
E	<705°C (1300°F)	=4 HT Fiberglass*
F	>705°C (1300°F)	=7 Bare ends (heat shrink)*

*If no transition (Z) is in symbol 13, we recommend these corresponding selections for primary wire insulation on hollow tube sensors.

#8	MEASURING JUNCTION [9]
G	Grounded
U	Ungrounded (RTD's are always ungrounded)
I	Isolated
E	Exposed
X	Other, specify

Note: See appropriate drawing on page 2-1 & 2-2 before you specify the immersion length.

#9	IMMERSION LENGTH (L)
--"	Length in inches

2	M	J	D	1	S	B	G	3"	

Part Numbers Complete at http://www.jms-se.com/pdf/JMS_Catalog_final.pdf

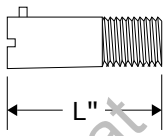
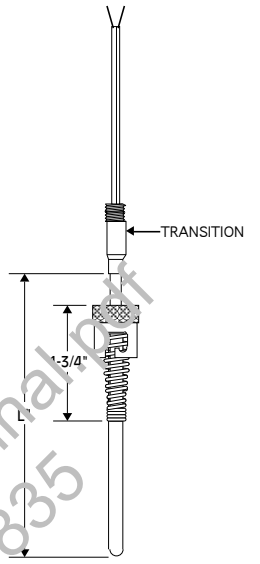
PLASTICS SENSORS



#10	ATTACHING DEVICES
J	Adjustable bayonet (**Standard**)
F	Fixed bayonet
P	Brass compression fitting 1/8" NPT
N	Non-Immersion nozzle
M	Nozzle melt
Z	N/A



Use "0" in symbol #9 for standard length. (See drawings on this page.)

X	Other, specify

Note: Non-fixed fittings do not affect the immersion length.

#11		ADAPTER TYPE		
1/8" NPT	3/8" x 24	NICKEL PLATED STEEL SLOT HEAD MOUNTING ADAPTER (FOR BAYONET ONLY)		
Z	Z	No adapter required	K	1/4" NPT X 1 1/4" long for 1/4" bayonet
A	E	7/8" overall length		
B	F	1 1/2" overall length		
C	G	2 1/2" overall length		
D	J	3 1/2" overall length		
X	X	Other, specify		

ADJUSTABLE BAYONET
(Top of cap is usually positioned 1/2" from transition at factory)

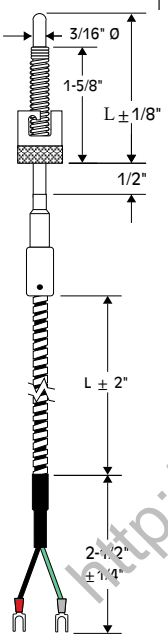
#12	LEAD WIRE TYPE & LENGTH IN INCHES	T/C	RTD
Z	No lead wires	20 awg	24 awg
1 __"	Glass braid	20 awg	24 awg
3 __"	FEP teflon	20 awg	24 awg
6 __"	Glass braid / flex armor overall	20 awg	24 awg
7 __"	Teflon / flex armor overall	20 awg	24 awg
8 __"	Glass braid / stainless steel overbraid	20 awg	24 awg
X __"	Other, specify		

Note: 24 awg wire or smaller may be used if necessary.

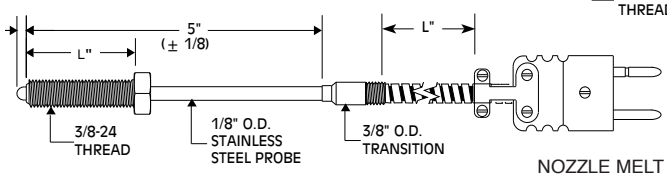
#13	TYPE OF TRANSITION [1-16]
H	Heat shrink
S	Size on size
T	3/8" OD (**Standard**)
R	1/4" OD
X	Other, specify
Z	No transition
C	Cuttable design (No crimp at end of tube / nylon insert)

Note: For high humidity / moisture environments ≤500˚ F put a "2" after your selection.

For high temperature at the transition area use an X + type of transition and maximum temperature.

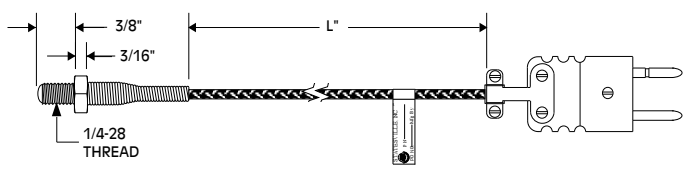


Note: When "Z" no transition is specified for a hollow tube sensor, the extension lead is crimped to the tube.



#14	COLD END TERMINATION (SECT 6, CHOOSE AS MANY AS APPLICABLE
A	Bare ends
B	Miniature plug (6A1B2)
C	Standard plug (6A1C2)
D	Miniature jack
E	Standard jack
F	High temperature plug (< 800˚ F)
G	High temperature jack (< 800˚ F)
I	Explosion proof Nema 7 head (6I / 6PT)
K	Spade lugs (6SL)
L	Aluminum head w/ hinged cover (6L / 6B4)
M	Aluminum head w/ screw cover & chain (6M / 6B4)
N	Cast iron head w/ screw cover & chain (6N / 6B4)
O	Open ceramic terminal block (6N)
Q	Black nylon Nema 4 head (6Q / 6B4)
R	High dome head (6R)
V	Hermetic connector (6DC) - Male
W	Microphone style connector (6DA) - Male
X	Other, specify

Note: For any other cold end terminations, use symbol X and descide using appropriate part numbers from section 6 in place of symbol #14.



#15	TAGGING AND CALIBRATION OPTIONS (USE ONLY IF APPLICABLE)
-----	See page 1-2 #14 for ordering selections.

PLASTIC MELT SENSORS

Plastic melt thermocouples and RTD's can fit directly into the melt stream of extruder heads. They can be used to control melt temperature gradients within the melt stream, to monitor incoming melt temperatures, or to achieve control of nozzle and nozzle manifold temperatures. All plastic melt bolts are Stainless Steel. The bolt tips are back filled with a ceramic insulator. The probe is .125" O.D.

ADJUSTABLE PLASTIC MELT SENSORS

Adjustable plastic melt sensors can be used to measure temperature gradients in melt streams. This design gives you the ability to have an adjustable immersion depth during full operation at maximum flow rates and pressure.

The length of the measuring junction is controlled by adjusting the setting of the knurled adjusting screw.

The probe should be adjusted to flush prior to melt cool down to eliminate probe breakage on start up.

This design also eliminates melt stream barriers and turbulence that could affect product quality.

It is used to profile dimensional stream temperature variations.

SPECIFICATIONS:

304 SS sheath, .125" O.D. Maximum temperature rating is 900°F. Pressure rating is 15,000 PSI.

TO INSTALL PROBE:

1) Use wrench only on hex closest to hot end.
2) Use fingers to adjust depth and lock nut.
3) **Do not use wrench on any part of assembly when machine is hot or under pressure.**

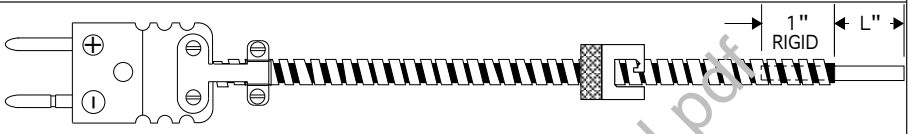
BOLT WITH 1 1/2” BENDABLE METAL EXTENSION AND FLUSH IMMERSION

BOLT WITH 24” FLEXIBLE ARMOR AND 1/2” IMMERSION



ADJUSTABLE PLASTIC MELT SENSOR

FLEX-ARMOR ADJUSTABLE DEPTH SENSOR

The flexible armor adjustable depth sensor allows adjustable immersion and spring loading in the field by simply moving the bayonet cap up and down the flexible armor. The construction is a hollow-tube design using 20 gauge or smaller fiberglass insulated wire inserted into the 1/8" or 3/16" tubing or flex armor. The flex armor is also rigid for the first 1" past the tip or hot end. Thermocouples have a flush immersion. The picture below shows a variation of this thermocouple. Good for dry temperatures between 55˚F up to 900°F.

SPRING ADJUSTABLE DEPTH SENSOR

The JMS Southeast spring adjustable sensor allows adjustable immersion in the field by moving the bayonet cap up and down the 12" spring. The construction is a hollow-tube design. Single element wire is 20 awg solid and dual element may be smaller to accommodate the tubing diameter. The wires are fiberglass insulated with stainless steel overbraid inserted into a .188" Ø tubing. (Available in .188" Ø only) The tube length immersion is 1". This design is good for dry temperatures between 55° F up to 900° F.

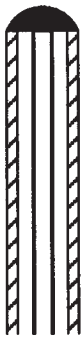
MgO VS HOLLOW TUBE



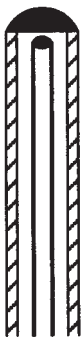
Bayonet thermocouples can be constructed with magnesium oxide sheath material of .125" or .188" O.D. Hollow tube units are made with lead wires inserted in tubing of .125" or .188" outer diameter. The magnesium oxide insulation is a dry, uncontaminated compacted ceramic powder. The MgO gives the thermocouple high insulation resistance and dielectric strength. Also, it allows excellent insulation of the positive and negative wire conductors in relation to each other and to the outer sheath. Among the outstanding features of sheath material are: (A) flexibility to bend or form to twice the radius of the sheath diameter, (B) its rigidity to maintain size and shape after bending or straightening, (C) vibration or shock has no effect on the material, (D) sheath material withstands pressures upward to 50,000 psi, and (E) sheath material may be used in applications where temperatures may range from -400° to 3000°f depending on requirements and selection of materials.

INSULATOR	PURITY %	MELTING POINT °C	MELTING POINT °F	USABLE TEMP. °C	USABLE TEMP. °F
MAGNESIA (MGO)	96.4% (std) 99.4% (must specify) 99.8% (must specify)	2790	5050	1650	3000

New insulation materials are being developed. Use an X and describe to specify.

The hollow-tube design is used for disposable thermocouples that can be replaced easily. Their life is about half of that of a magnesium oxide insulated thermocouple. The advantage of a hollow-tube design is the cost. It is the least expensive design, for the short run.

MEASURING JUNCTION

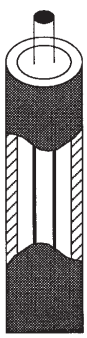


GROUNDED JUNCTION

The **grounded** thermocouple junction is an integral part of the thermocouple sheath tip.

Advantages:
- fast response time in relation to ungrounded and isolated junctions.
- protects the wires from environmental chemicals and corrosives.
- prolongs the operational life of the thermocouple. Longer lifespan than the exposed junction thermocouple.
- it is recommended for high pressure applications.
- it is the least expensive construction.

Disadvantages:
- thermal expansion of sheath material may differ from element to cause mechanical stress and work hardening of metals.
- ground loops may cause interference with instruments.
- faults in insulation are more difficult to detect.



UNGROUNDED JUNCTION

The **ungrounded** thermocouple junction is electrically insulated and electrically isolated from the outer sheath material. In a dual ungrounded thermocouple, one common junction is electrically insulated from the outside sheath.

Advantages:
- the thermocouple junction is isolated from the ground.
- defects in the MgO insulation can be detected by measuring resistance from loop to sheath.
- long term drift under cycling conditions is minimized.

Disadvantages:
- response time is usually slower than grounded thermocouples.
- more expensive than grounded thermocouples.

EXPOSED JUNCTION

The **exposed** thermocouple junction extends beyond the protective metallic sheath.

Advantages:
- recommended for measurement of noncorrosive static gas, or air.
- very fast response time, faster than grounded junction.

Disadvantages:
- cannot be used in an environment with a high percentage of solids, high pressure, or flowing material since the junction is exposed to this environment.

ISOLATED JUNCTION

Isolated thermocouple junctions are used in a dual or triple thermocouple when the junctions are isolated from the outer sheath material as well as from each other.

Advantages:
- the two elements are insulated from ground.
- performs better than ungrounded or grounded junctions in a thermal cycling environment.

Disadvantages:
- slower response time than a grounded dual thermocouple.

* For tip sensitivity information, see pg. 3-8.

Please Note:

JMS Southeast has helped develop several new & innovative designs for measuring temperature in numerous sorts of plastic melt situations, from automatic profiling of nozzle melts to surface temperatures. Ask us & we'll refer you to the real experts in plastics extrusion & molding!

EX. Part#: 3ESBK12"CEXZZYZL
X = NUN6"G1

Drawing 3-A Internal View

An extension assembly may be needed to provide extra length for your RTD in order to extend your RTD head through insulation, or away from the heat of the process. This extension can include a pipe nipple only or a nipple-union-nipple or a nipple-union with a spring-loaded fitting from symbol #8 page 3-1.

Standard nipples and unions are 1/2" NPT and are available in galvanized or stainless steel. The union joins two nipples in an extension assembly and has a standard pressure rating of 150 pounds.

When a nipple-union-nipple or nipple only assembly is used and spring loading of the thermocouple element is required, there are two different methods of spring loading the sensor. The preferred method is to use the machined 1/2" by 1/2" NPT spring-loaded stainless steel fitting as one of the nipples (see symbol #8, S page 3-1). With this design, the probe is secured within the fitting and is mounted to the head in a rigid manner (see drawing #2 above). The appropriate part number for this assembly would be selected from symbols #8 (S) and #9 (X) from page 3-1 and 3-2, in addition to the symbols on this page. A cheaper method is a spring mounted over the probe and loaded against the bottom of the terminal block in the head. With this method the probe is not supported within the nipple-union-nipple. It is secured only by the wires into the terminal block. (See drawings 1 & 3 above). We do not recommend that you use this method of spring loading if your probe is mounted horizontally.

When a nipple-union-nipple is specified, the nipple and union closest to the head or cold end termination (drawing 2 & 3 above) is kept at an approximate length of 3 1/2". The length of the NUN is varied by the nipple length beyond the union on the probe end of the assembly.

For example, if a NUN 6" G is required, nipple #2 length would equal approximately 2 1/2".

When specifying this sensor extension, the nipple-union-nipple length tolerance is ± 1/2".

#1	EXTENSION ASSEMBLY

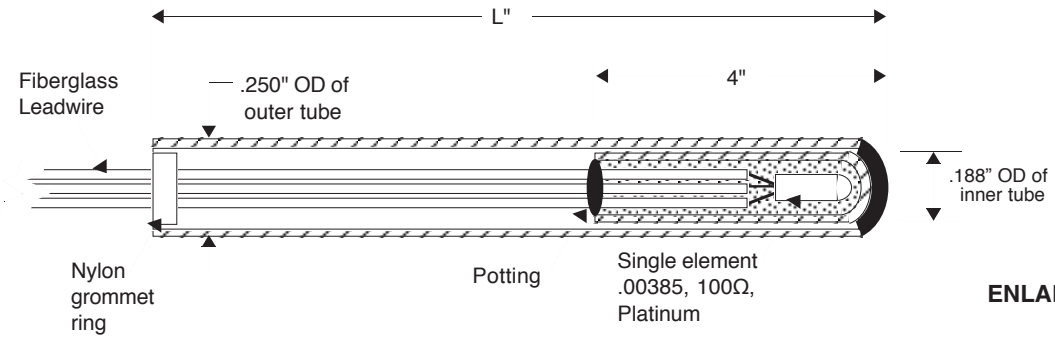
CUT TO LENGTH / UNIVERSAL RTD

JMS Southeast manufactures a cuttable resistance temperature detector that can be cut to 4” in length from a standard length of 24”. The design provides flexibility to the end user that enables him/her to order one RTD length for all applications. The standard universal RTD is the 100 ohm, .00385 ohm/ohm/C DIN, single element. The tubing is 316 stainless with an outside diameter of 1/4”. This unit is potted with high temperature cement and assembled with 48” of fiberglass lead-wire with no cold end termination. If a different fitting or longer leadwire is required, change these characters in the part number accordingly on pages 3-1 and 3-2. If the probe will be used at temperatures above 550°F change symbol “7” accordingly.



Feel free to call JMS for additional information. A typical JMS part number for this standard unit is as follows:

3ESQK24”DZZ1-48”ZYZA
[For Cuttable Thermocouples go to page 2-1 and 2-2]

Special note: Cuttable sensors may not provide the best accuracy over periods of time. They are not recommended for critical applications.

NOT TO SCALE

ENLARGED VIEW

HIGH TEMPERATURE RTD’S

JMS now offers an industrial RTD, capable of withstanding temperatures and vibration previously requiring a thermocouple. Manufactured using a special high temperature cable, the probe can be bent to a radius of twice its diameter.

Inconel 600 is primarily used for high temperature applications; while 316 stainless steel is available for situations where high vibration is the main concern. Solid leads of 24 awg. for the .188” diameter probes and 22 awg. for the .250” diameter probes match the temperature and vibration resistant qualities of this special design.

Following is a table outlining the available initial calibration specifications for this probe design. Ordering of these elements may be made on page 3-1.

Tube Material	Tube Diameters	Element Construction	Resistor Class
316 SS, Inconel 600	.188”	Single 3-wire, Single 4-wire Dual 3-wire	≥1/2 W 0.1
316 SS, Inconel 600	.250”	Single 3-wire, Dual 3-wire Single 4-wire	

AVERAGING RTD'S

Continuous averaging resistance temperature detectors are most frequently used in air washing and air handling systems where turbulent and stratified air flow may effect the temperature measurement in a tip sensitive probe. The average temperature of the air in the duct can be measured with this type of sensor.

Any application which requires an averaging of temperature across an area would be suited for this sensor type.

The operating temperature range for a continuous averaging RTD is from -100 to 400°F. The lower temperature and temperatures up to 500°F are handled with a multipoint design (4, 8, or 16 points).

Please contact JMS Southeast with any questions or application problems you may have.

LOW COST AVERAGING RTD'S

Sense temperature of air streams in ducts and plenums. Sensors include a junction box with gasket to prevent leakage and vibration noise.

These thermometers have a continuous element to sense true average temperature along their entire length. They provide accurate composite reading in locations where air may be stratified into hot and cold layers.

Rigid averaging sensors have a brass case. Bendable models have aluminum sheaths (copper on special order) formable to a radius of 4". Bendable sensors can criss-cross duct to average temperatures in two dimensions.

Specifications:
Temperature range: -45.5 to 135˚ C (-50 to 275˚ F)
Gasket: 100˚ C (212˚ F)
Leadwire: 22awg, teflon insulated, 8" long
Sheath diameter: .188" OD.

RTD'S - RESISTANCE TEMPERATURE DETECTORS

RTD's work on the principle that there is a positive correlation between the electrical resistance of a metal conductor and changes in temperature. The standard temperature range is from -200°F to 900°F. High temperature assemblies are available which can operate at up to 1475°F.

The advantages of using RTD's include accuracy, repeatability, and stability. Another advantage is that cold junction compensation is unnecessary. Copper wire is used for all connections. The signal level of an RTD is over ten times higher than that of a thermocouple which eliminates the need for high gain amplifiers. The signal is also less susceptible to noise than thermocouples. The accuracy of a 4 wire RTD is independent of the distance between the sensor and the readout instrument.

COMPONENTS OF RTD's

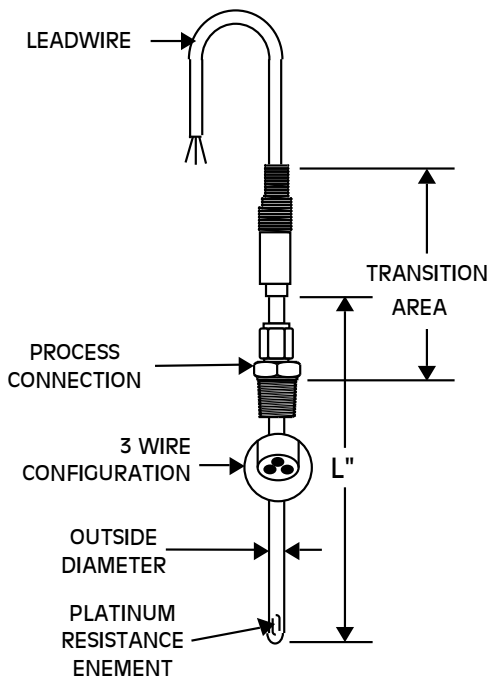
The Platinum Resistance Element

This is the actual temperature sensing portion of the RTD. Elements range in length from 1/8" to 3" (See Pg 3-8). There are many options. The standard resistance is 100 ohms at 0°C and the standard temperature coefficient is an alpha of 0.00385. A complete list of options is listed on page 3-22.

Outside diameter / Inside diameter

The most standard outside diameter is 1/4". However, outside diameters range from .063" to .500". A selection of tube diameters can be found on page 1.

Tubing Material



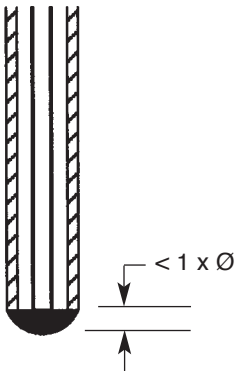
316 Stainless steel is commonly used for all assemblies up to 500°F. Above 500°F it is advisable to use Inconel 600. A list of some materials available is on page 1.

Process Connection

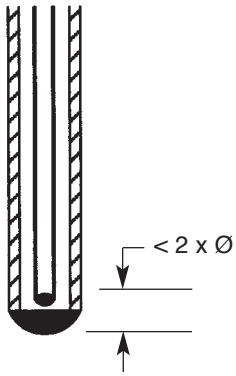
Process connection fittings include compression fittings and 1/2" N.P.T. x 1/2" N.P.T. welded or spring-loaded fittings. Various connection options are listed on page 1.

Wire Configuration and Insulation

RTD's are available in two, three, and four wire configurations. Three wire configuration is the most common. See page 3-17 for further information on selecting wire configuration for your application. Teflon and fiberglass are the standard wire insulation materials. Teflon is moisture resistant and has a maximum temperature rating of 400°F. Fiberglass is used for high temperature applications because it has a maximum temperature rating of 1000°F. ALO_2 powder is used to fill voids. Hard ceramic insulators may be used for high temperatures.



Cold End Termination

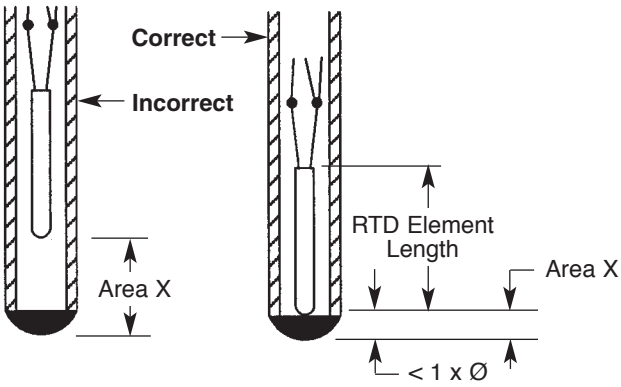


This may be in the form of bare wires, plugs, or terminal heads. The accessory section contains a wide variety of these options. Standard cold end terminations are listed on page 3-2.

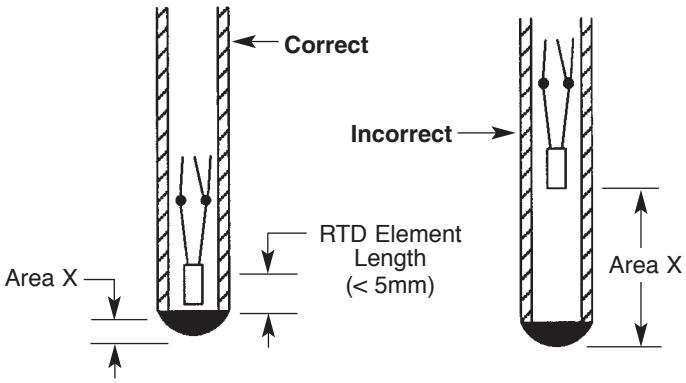
TIP SENSITIVITY

Tip sensitivity in the finished probe is usually not considered a serious factor in sensor specifications. However, JMS SE believes tip sensitivity is extremely critical if the customer is to receive the same results time after time. For instance, if the sensor was originally designed to minimize penetration into the process, a thin film sensor might have been used. If that sensor is later replaced with a standard 15mm long element, response time will change drastically, affecting the PID of a control situation and certainly the total temperature reading of the process would be upset.

GROUNDED T/C



UNGROUNDED T/C



AREA X (How far is the tip of the sensing element from the tip of the tube?)

In any sensor or probe the location of the element inside the tube is critical. Even if the sensor element was 2" away from the tip, that condition would go undetected using the ASTM tests. (18 x Ø for wire thermocouples) JMS tests for the element placement on our sensors in order to assure consistency of your measurements.

Area X = <1 x Ø.

RTD ELEMENT

TYPE T RTD ELEMENT

RTD element length: E, P, S standard = 8mm - 15mm
"T" thin film = 2mm - 5mm
Others = 8mm - 50mm

Special designs can be used to obtain certain tip sensitivity. Ask your sales representative at JMS.

RTD STANDARDS

Maximum Operating Range = -200°C to 850°C (-392°F to 1562°F)
Note: RTD's are not commonly used above 900°F. However, JMS offers a special high temperature RTD which will withstand temperatures up to 1560°F.

Interchangeability = ±.01°C to .25°C at 0°C

Stability = Less than .05°C shift per year.

Electric Supply = AC or DC ≤ 500 Hz.

Nominal Operating Current ≤ 1 milliampere.

Maximum Safe Current = 20 Milliamperes.

Insulation Resistance = 100 mega ohms minimum at 50 VDC.

Probe Encapsulation = High purity alumina oxide.

Time constant for RTD element without tubing = 1 second maximum for the sensor to reach 63.2% of a step change in temperature in water at 3 feet per second.

RTD probes will usually not have a transition if the lead wires are less than 12" in length.

Accuracy
The standard accuracy of JMS Southeast's RTD is .1% of resistance at 0°C . Accuracies of .03% and .01% of resistance at 0°C are also available.

Stability
JMS Southeast bulbs are aged as part of the manufacturing process, thus ensuring high levels of stability. Generally the resistance at 0°C will hold less than a .05°C shift per year.

Vibration
JMS detectors can withstand a vibration level of 30g over the frequency range 10 Hz to 1 KHz.

Pressure
JMS RTD's are insensitive to large changes of pressure.

Response Time
Response time of JMS Southeast metal encapsulated probes is dependent on the outside diameter of the probe and the immersion media, usually matches that of the same size ungrounded thermocouple. (See page 1-13)

Self Heating
When tested in accordance with requirements of BS 1904: 1964 Section 3.16 the indicated temperature rise in the temperature detector with a power of 10.0mW dissipated in it, will not exceed +.3°C.

RESISTANCE TEMPERATURE DETECTORS

General Information

A resistance temperature detector or platinum resistance thermometer works on the principle that the electrical resistance of a metal changes in a significant and repeatable way when temperature changes. This resistance is inversely proportional to cross sectional area and proportional to length.

Platinum is the most widely used metal for resistance temperature detection due to the following characteristics:

1) chemical inertness
2) a temperature coefficient of resistance that is large enough to give readily measurable resistance changes with temperature
3) an almost strain free fabrication metal (in that resistance doesn't drastically change with strain)
4) an almost linear relation between resistance and temperature

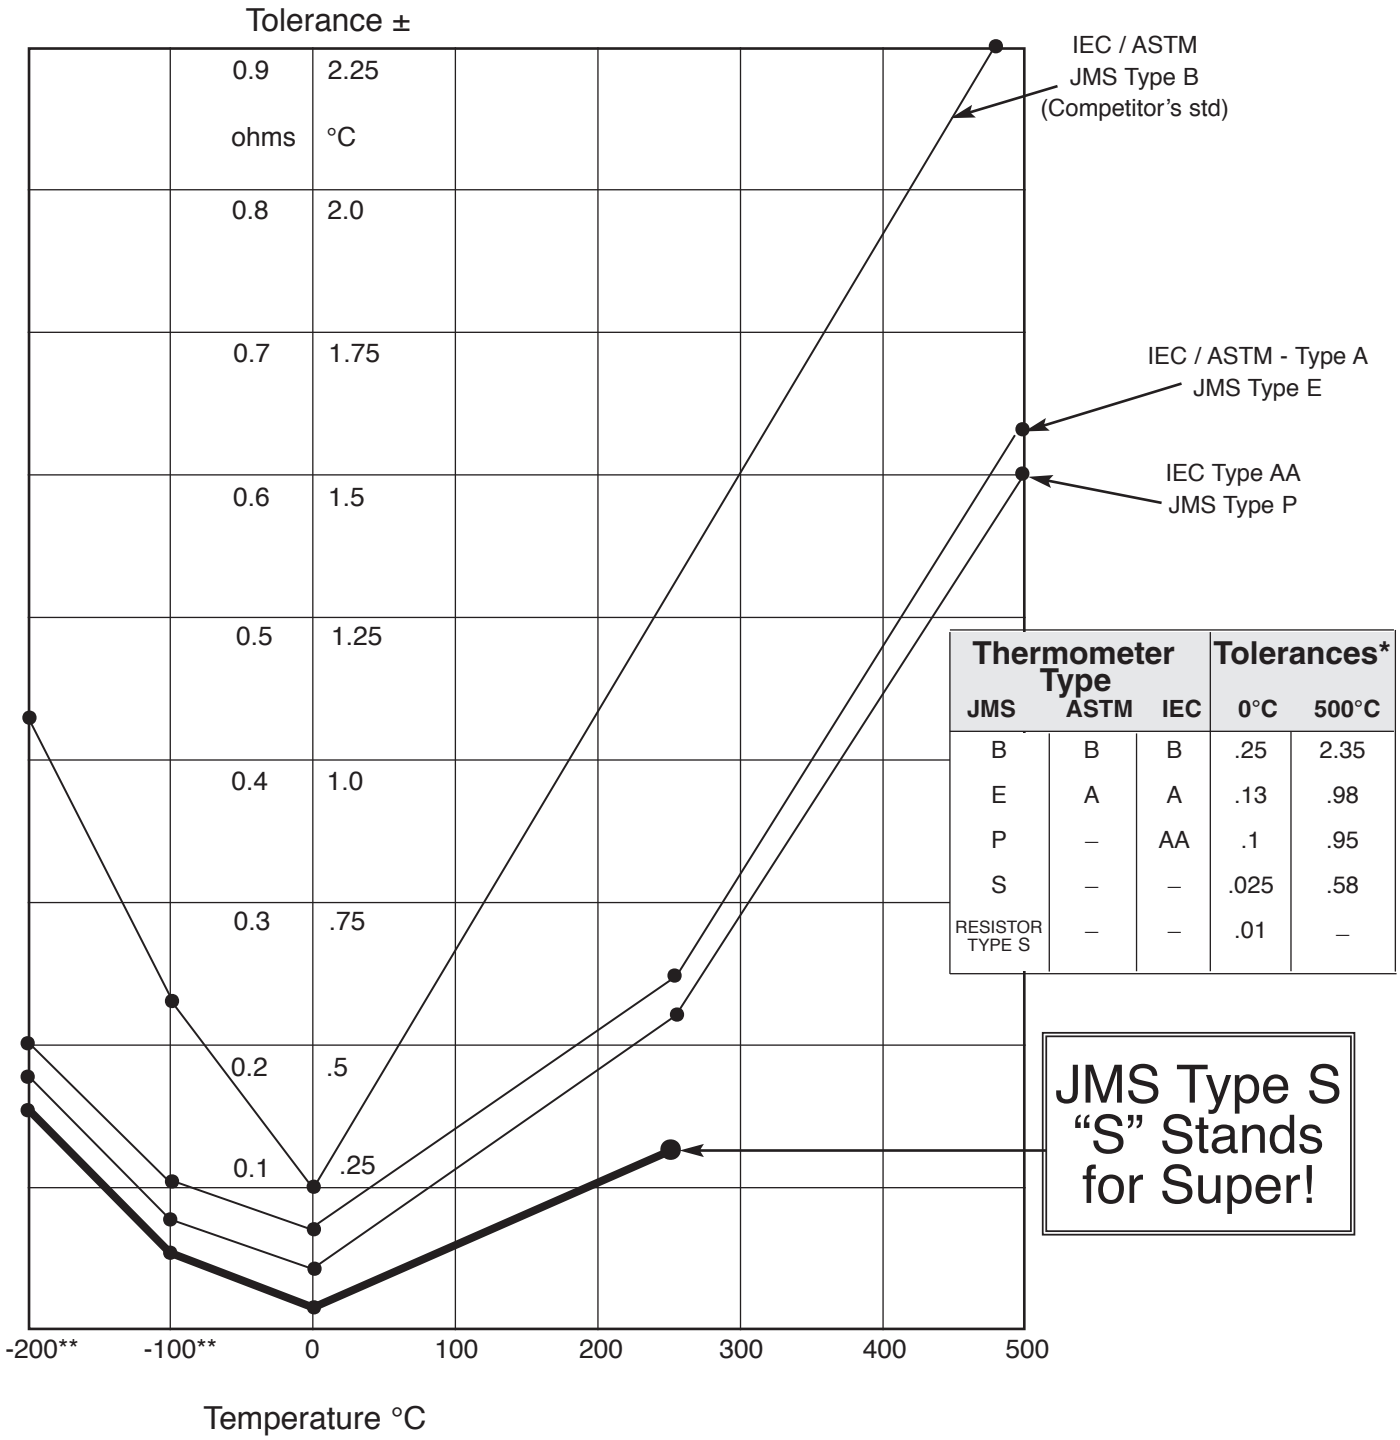
Each resistance versus temperature relation for an RTD is qualified by a term known as "alpha". "Alpha" is the slope of the resistance between 0°C and 100°C. This is also referred to as the temperature coefficient of resistance, with the most common being 0.00385Ω/Ω/°C.

Other types of RTD's manufactured include copper, nickel and nickel alloys.

The amount of resistance of an individual RTD bulb (100Ω, 200Ω, etc.) is determined by the amount of metal between the terminal points and by the configuration of the element.

When ordering an RTD, the alpha and resistance value at 0°C (i.e.: Ro) must be specified to match the measuring instrumentation used with the RTD.

The RTD standard must also be specified. There are several RTD standards set by various organizations. These specifications are not identical and read out instrumentation must be adjusted for the specific standard of the RTD used with that equipment. Differences in the alpha values of these standards can cause errors in measurement of an RTD if one standard is connected to the instrumentation of another standard.



The following chart indicates some common RTD standards.

ORGANIZATION	STANDARD	ALPHA	NOMINAL RESISTANCE(ohms) AT 0°C
American Scientific Apparatus Makers Association (SAMA)	RC21-4-1966	0.003923	98.129

TUBE MATERIAL

JMS Southeast, Inc., recommends stainless steel tubing as the encapsulation for RTD's in most industrial applications.

If a corrosive environment exists, 316 low carbon stainless steel is recommended due to its resistance to corrosiveness. A more detailed explanation of this phenomenon follows.

For high temperature RTD's above 500°F, we recommend I600 encapsulation due to the absence of iron in I600. Platinum RTD bulbs sometimes experience "poisoning" at high temperatures due to iron migration. The iron attacks the grain boundaries of the platinum and the alpha of the bulb is erroneously lowered, thus yielding lower temperature readings than actual.

Please contact JMS for questions concerning environmental condition questions or exotic material needs for probe encapsulation.

CORROSION IN 316 STAINLESS STEEL VERSUS 316 LOW CARBON STAINLESS STEEL

Barbara Feldhacker Hudson
JMS Southeast, Inc.
Statesville, NC

BACKGROUND:

When 316 stainless steel is welded it is exposed to temperatures in the range of 1000°F to 1600°F and carbon readily diffuses toward the grain boundaries in this temperature range. This excess carbon in these areas adjacent to the grain boundaries combines with the chromium in the steel to form chromium carbides. This action depletes the effective chromium content near and at the grain boundaries, leaving this area of the metal susceptible to corrosive attack. When welding occurs and this phenomenon occurs, the chromium from within these grains cannot replenish this shortage rapidly enough to overcome this susceptibility. This is called "sensitization."

Stainless steel loses its resistance to corrosion when the chromium content drops below 10.5-11%. Intergranular corrosion occurs when the chromium content along the grain boundaries drops below this amount. The less chromium present the more rapid the attack that could ensue.

Corrosion also occurs more readily in austenitic stainless steels that contain more than .03% carbon due to the fact that complex chromium carbides precipitate along grain boundaries when the chromium ties up with this carbon. After the metal is cooled from the 1000°F-1600°F temperature range, any areas that experienced that temperature and are depleted of chromium are very susceptible to corrosion. In the manufacture of resistance temperature detectors, approximately the last 3 inches of the probe and the weld area experience these temperatures. Therefore, they are prime candidates for corrosion.

CORROSION PREVENTION:

There are a number of ways to combat the susceptibility of corrosion in 316 stainless steel. We have investigated a number of options. Water quenching of the entire susceptible area would avoid this corrosive property due to the fact that this cooling would dissolve the chromium carbides and the chromium content would be again uniform throughout the metal. Water quenching cools the metals rapidly enough to prevent the combination of chromium with carbon. We, at JMS, felt this option was not as feasible due to the problem of quenching every probe in manufacturing. This could not be done to an RTD assembly due to the fact that it would cause thermal shock to the probe and a sudden strain to the RTD bulb. RTD's are susceptible to strain and thermal shock and this could be detrimental to the sensor.

A second method of avoiding the corrosion phenomenon in 316 stainless steel is to add carbide forming elements to the stainless steels. If the carbon in the metal is tied up with other elements, it can not tie up with chromium and the free chromium present could not form chromium carbides and migrate to the grain boundaries. Some elements added to stainless steels for this purpose are titanium, columbium and tantalum. These elements have greater affinity for carbon than chromium so they stabilize the steel against chromium depletion. An example of this is Monel. This is a

more expensive option than what JMS Southeast decided upon.

A third method to avoid this possibility of corrosion of 316 stainless steel is to keep the steel in the "sensitizing" temperature range (1000°F-1600°F) for a long enough time for thermal stabilization to take place. The chromium carbides do form at the grain boundaries; however, after additional time, the chromium can diffuse into the area of impoverished grain boundaries.

The option was not feasible however, due to the fact that this thermal stabilization usually takes four hours. This is difficult to impossible to accomplish during welding.The method that JMS Southeast decided upon to combat corrosion in 316 stainless steel is to keep the carbon content so low in the metal that there is not adequate carbon present to form detrimental amounts of chromium carbide. If there is not enough carbon to tie up with the chromium then the chromium does not become depleted and corrosion is much less likely to occur. This type of protection is accomplished by using 316 low carbon stainless steel (316L) which has a maximum carbon content of .03%.

In an environment containing chlorides, the 316 stainless steel probe is at an even greater risk due to the fact that chlorides promote the formation of active/passive electrolytic cells. This can be explained by the fact that all stainless steels are passive under most conditions; however, if the probe is exposed to the "sensitization" temperature range and this molecular transformation occurs it forms anodic area (opposite the passive area). The oxygen around these two areas serves as a depolarizer and corrosion proceeds at an accelerated rate at the point the two areas meet.

Chlorides also have a higher valence state. Any chloride in an appreciable concentration is a source of trouble in promoting corrosion. Therefore, the use of 316 low carbon stainless steel becomes even more necessary in a chloride atmosphere if the metal is to endure a satisfactory lifetime. This occurs in an area that has been welded and is adjacent to the non-effected area.

Another problem of chlorides is that deposits may occur in crevices on the probe. In a crevice, oxygen supply is limited and cannot repair the passive oxide film. A crevice stays damp longer than a fully exposed surface. Salts are likely to accumulate in crevices particularly if the area around the crevice is alternately wet and dry. If the oxygen concentration decreases below a level necessary to maintain passivity in the anodic area, there is a double electrolytic effect. The difference in oxygen concentration alone will tend to promote attack on the anodic area and the potential between the passive and active area is already quite high, so corrosion becomes even more aggressive. Chlorides, being electrolytes will not contribute to passivity and will become very acidic thus accelerating the corrosive attack even more.

It is to difficult to predict the corrosion rate of 316 stainless steel or 316 low carbon stainless steel due to the environmental variables; however, our experience has shown an increase of up to twice the life in a low carbon stainless steel probe versus a standard stainless steel probe. The problem with pitting corrosion and crevice corrosion in an RTD probe is that through these openings in the metal sheath, the RTD bulb can become contaminated and fail. If quantified specimen tests are needed, the ASTM lists some approved corrosion testing procedures.

In the ASTM A262-64 Standard two widely used intergranular corrosion susceptibility tests are described. They include the Huey test, which test subject samples to five 48 hours boils in 65% nitric acid solutions. A weight loss after each boil is noted and translated to a corrosion rate in inches per month. This test, however, indicates overall corrosion not grain boundary corrosion.

A second test is the oxalic acid etch test which involves etching a polished specimen then examining the appearance under a microscope. Comparisons are then made to some ASTM photographs.

Two other tests listed in A262 are the boiling sulfuric acid-ferric sulfate solution test and the nitric acid-hydrofluoric acid test at room temperature. These are not as widely used, however.

In conclusion, corrosion of 316 stainless steel in a chloride environment is a definite problem. To minimize this problem, low carbon stainless steel metal should be used in this environment as the encapsulation for RTD probes. If this is not done, the RTD longevity will be substantially reduced. JMS Southeast recommends the use of 316 low carbon stainless steel to all our customers who are using RTD's for temperature measurement in a process that contains chlorides.

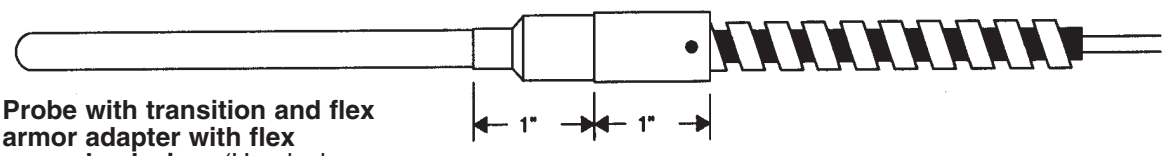
RTD TRANSITIONS

The transition on an RTD assembly supports the lead wires attached to the RTD probe and contains the protective potting compound used to encapsulate the probe. The transition is stainless steel and has a .375" outside diameter for 3/4", and tapers down over the probe for an additional 1/4". This 1/4" outer diameter is approximately .055" larger than the probe outer diameter.



The bell spring adds approximately 1" to the rigid length of the probe.

Probe with transition and bell spring relief

Probe with transition only with flexible armor lead wire
(Standard on low temp. (transition) single elements)

Probe with transition and flex armor adapter with flex armor lead wire. (Used when armor is 60" or greater.)

JMS provides special hermetic sealing from moisture for those sensors used in high humidity / moisture or total immersion environments. Use a "2" after your selection in symbol #13 page 3-2. Any moisture penetrating the transition will kill the integrity of the electrical property of the sensor. Our special hermetic sealing will prevent this as well as possible in any environment. See page1-16 for more information.

TOLERANCES

Tolerances of RTD's are specified as a function of temperature.

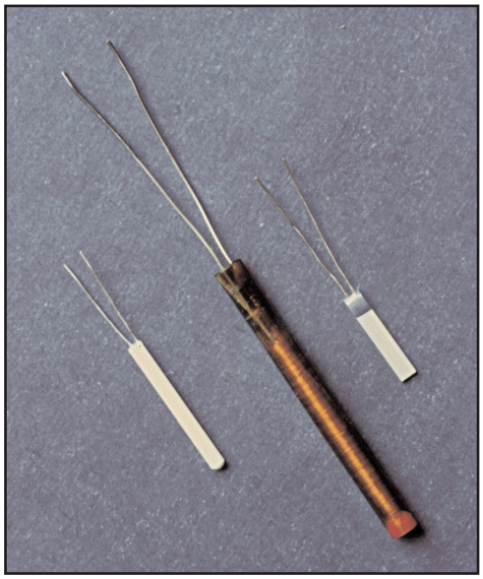
They can be expressed in ohms, temperature, or percentages.

JMS now features RTD Thermometers using platinum resistors with a tolerance as low as 0.01% of resistance @ 0°C.

Better accuracies are possible by performing calibrations on a sensor at several different temperatures and listing exact resistance readings of that RTD at those temperatures. This is a more expensive method, but can be cost effective when accuracy is critical in a process. (See pages VIII, IX, X)

Readout instrumentation of RTD's converts resistance to temperature. Typical accuracies of this equipment are 0.1%. Lead wire and connection error for 2 and 3 wire RTD's can be significant.

After an RTD is manufactured there are some conditions that can alter the accuracy and reliability of an RTD. Moisture within the RTD can decrease the resistance value of the RTD and cause errors. Bad seals on the RTD are usually the cause. High temperatures can cause the insulation material's electrical resistance to decrease significantly. Also, at high temperatures, if any iron exists within the probe, iron migration can cause a poisoning of the platinum, thus measurement errors.



Physical or mechanical changes can cause shifts in the calibration of RTD's.

Rapid cooling can cause defects in the platinum structure and thus measurement errors. The defects can usually be eliminated by reannealing at 450°C.

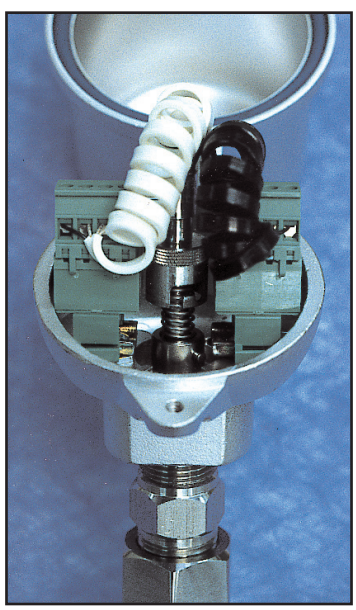
Vibration in the process can also cause a drift in RTD's by causing a shift in the windings.

Stretching or strain on a metal can change it's resistance independent of temperature.

Due to the fact that RTD's are wound on a mandrel and supported in some way, the expansion coefficient of the supporting medium should match that of platinum, or else the actual contact of the winding with the medium used should be minimized. Thin film, thick film, totally supported, partially supported and bird cage constructions all have specific applications. JMS Southeast, Inc. manufactures high quality RTD's using thin film and semi-supported bulbs.

4, one hour sessions training video. $1200.00 - Call for information.

THERMOCOUPLES VS RTD'S



The following chart indicates some inherent advantages and disadvantages of RTD's or thermocouples.

	THERMOCOUPLE	RTD'S
Accuracy	Limits of error wider than RTD	Limits of error smaller than thermocouples
Ruggedness	Excellent	Sensitive to strain, shock, and pressure
Temperature	-400° to 4200°F	-200° to 1500° F
Size	Can be as small as .01" sheath material, tip sensitive	Size limited to 1/16", temperature sensitive for length of bulb
Drift	Should be checked periodically, higher than RTD's	0.01 to 0.1°C per year, less drift than thermocouple
Resolution	Must resolve millivolts per degree, lower signal to noise ratio	Ohms per degree, much higher signal to noise ratio than thermocouple
Cold Junction Reference	Required	Not required
Lead wire	Must match lead wire calibration to thermocouple calibration	Can use copper lead wire for extension wire
Response	Can be made small enough for millisecond response time	Thermal mass restricts time to seconds or more
Cost	Low	Higher than thermocouples

Why a 3 minute egg in Denver, Colorado is softer than a 3 minute egg in Denver, North Carolina.

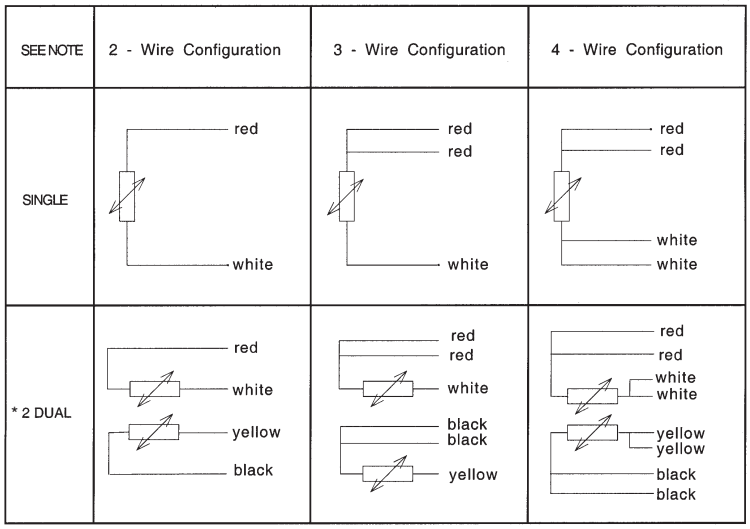
LEADWIRE CONFIGURATION EXPLANATION



A resistance temperature detector determines the temperature by measuring resistance. The sensing element is usually a small diameter wire manufactured so that its resistance will change in a known and consistent manner. To measure the resistance accurately and consistently, other extraneous resistances must be compensated for or minimized. A major cause of extraneous resistance is leadwire in series with the RTD. The readout is the sum of the bulb resistance and the leadwire resistances. The leadwire resistance can be compensated in most applications by a three wire RTD leadwire configuration.

In the three wire configuration, the power supply is taken to one side of the resistance temperature detector. This puts the other two leadwires in opposite arms of the wheatstone bridge so that they cancel each other out and have little effect on the bridge output voltage. In the 3 wire configuration, the resistance of the lead wire length is compensated for in the Wheatstone bridge. This design is recommended for most industrial applications.

An even more accurate wire configuration is the 4 wire design. In this design, leadwires #1 and #2 are on one side of the power supply while leadwires #3 and #4 are on the other side of the power supply. All four leadwire resistances in this case are negated and the bulb resistance stands as the resistance input alone. We strongly recommend this design. You must have a good 4 wire input device. Call us for recommendations.

Note:
For numbering sequence of connectors and terminal blocks see Section 6.

***Note:**
The different colors for the 2nd set are used when the wire are not otherwise distinguishable

RTD Operation and Installation Instructions:

RTD's are installed by means of compression fittings, welded or spring-loaded NPT fittings, or bayonet fittings.

Follow these instructions for installation of an RTD with a 1/2" x 1/2" NPT fitting:

(1) Insert RTD into process hole or opening.

(2) Tighten probe into place by turning probe into threaded connection.

If cold-end termination of the RTD is wired into head and you have a spring loaded fitting, then the wires should be disconnected from the terminal block to prevent twisting and shorting.

ELECTRICAL:

Make sure the extension wire is clean so that a good electrical connection will result at the terminal block. We recommend the use of a lacquer, cement, or other moisture proof sealing to prevent oxidation and the loosening of terminals. Connect the positive extension wire to the positive RTD wire and the negative extension wire to the negative RTD wire. Wires are color coded for identification as follows:

When using THERMOCOUPLE STYLE PLUGS (6A type, see pg 6-3)

Two Wire Configuration:
Connect the white wire to the positive connection terminal and connect the red wire to the negative connection terminal.

Three Wire Configuration:
The two red wires are common. Connect the white wire to the largest pin connection terminal and the two red wires to the two small pin connection terminals. The second red wire is the compensating lead wire.

RESISTANCE CHARACTERISTICS

Characteristics

The temperature/resistance relationships and tolerances on this page are valid for the sensing resistor at its measuring points. For thermometers they are valid for the complete thermometer at its terminals.

In the case of two-wire connections the resistance values of the leads between the measuring point of the resistor and the terminals must be considered. They may be indicated on the thermometer and must be subtracted from measured values in ohms. In some cases it also may be advisable to consider the temperature coefficient of the leadwires and the temperature distribution along their length.

Temperature/resistance relationships

The temperature/resistance relationships used in this standard are as follows:

for the range of -200°C to 0°C:

$$R_t = R_o[1 + At + Bt^2 + c(t - 100°C)\, t^3]$$

for the range of 0°C to 850°C:

$$R_t = R_o(1 + At + Bt^2)$$

For the quality of platinum commonly used for industrial resistance thermometers, the values of the constants in these equations are:

$A = 3.9083 \times 10^{-3}\ °C^{-1}$ $\qquad$ $C = 4.183 \times 10^{-12}\ °C^{-4}$

$B = 5.775 \times 10^{-7}\ °C^{-2}$ $\qquad$ t = Modulus of temperature without sign

For resistance thermometers satisfying the above relationships, the temperature coefficient is defined as:

$$a = \frac{(R_{100} - R_0)}{100 \times R_0}$$

has the value $0.00385055°C^{-1}$

where

R_{100} is the resistance at 100°C;
R_0 is the resistance at 0°C.

These equations and coefficients are listed as the basis for the temperature / resistance tables in this book. The calibration of individual thermometers will yield different coefficients.

Values of temperatures in this book are based on the International Temperature Scale of 1990 (ITS 90).

Resistance values

Most resistors are constructed to have a nominal resistance of 100Ω. The resistance vs. temperature table is calculated for a resistance of 100.00 Ω at 0°C. For other nominal resistances R_{nom} such as 500 Ω or 1000Ω the table can be used by multiplying the table values with the factor $R_{nom}/100$.

General Requirements (Tolerances)

Sensing resistors

The tolerance values of wirewound resistors are classified in table 1 and the values of film resistors are classified in table 2.

Table 1: Tolerance classes for wound resistors

Tolerance class	Tolerance value (°C)	Temperature range of validity of tolerances
W 0.1	±(0.1°C + 0.0017 [t])	-50°C + 250°C
W 0.15	±(0.15°C + 0.002 [t])	-100°C to 450°C
W 0.3	±(0.3°C + 0.005 [t])	-196°C to 661°C
W 0.6	±(0.6°C + 0.01 [t])	-196°C to 661°C

Table 2: Tolerance classes for film resistors

Tolerance class	Tolerance value (°C)	Temperature range of validity of tolerances
F 0.1	±(0.1°C + 0.0017 [t])	-50°C + 250°C
F 0.15	±(0.15°C + 0.002 [t])	-50°C to 450°C
F 0.3	±(0.3°C + 0.005 [t])	-50°C to 661°C
F 0.6	±(0.6°C + 0.01 [t])	-50°C to 661°C

Table 3: Tolerance classes for thermometers (finished probes)

Tolerance * class	Tolerance values (°C)	
AA	±(0.1 °C + 0.0017 [t])	-50 to 250°C
A	±(0.13°C + 0.0017 [t])	-100 to 450°C
B	±(0.25°C + 0.0042 [t])	-196 to 600°C
C	±(0.6°C + 0.01 [t])	-196 to 600°C

* These tolerances meet or exceed ASTM / IEC thermometer class. They do not necessarily determine the working range of the thermometer.

Nominal Resistance

The platinum element of the standard industrial type RTD has a base reference resistance of 100 Ω at 0°C. Platinum 100 Ω, temperature coefficient = 0.00385/Ω/Ω/°C.
This meets the ASTM standard 1137 and also meets the IEC 751. All readings based on ITS 90 - International Temperature Scale 1990.

TEMPERATURE CONVERSION TABLE

Read known temperature in bold face type.
Corresponding temperature in degrees
Fahrenheit will be found in column to the right
Corresponding temperature in degrees
Centigrade will be found in column to the left.

FREEZING TEMPERATURE OF METALS

* Represents information from ITS-90 Temperaure Scale.

THE INTERNATIONAL SYSTEM OF UNITS (SI)

The information provided below is for convenient reference in providing product specification is SI.

SI Base Units
SI is founded on seven base units:

Quantity	Name of Unit	Symbol
length	meter	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
thermodynamic temperature	centigrade or fahrenheit	C or F
amount of substance	mole	mole
luminous intensity	candela	cd

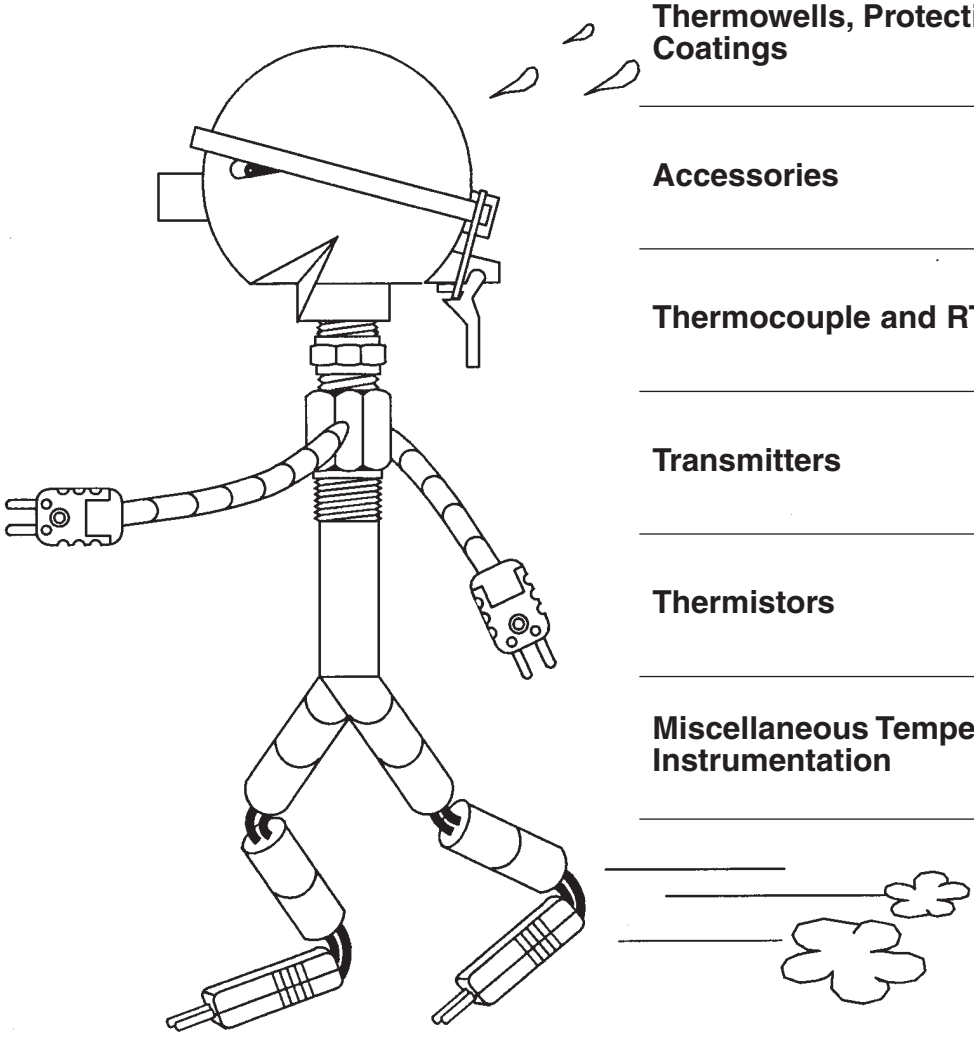
There are also two supplementary units:

Quantity	Name of Unit	Symbol_____ ___
plane angle	radian	rad
solid angle	steradian	sr

SI Derived Units
Derived units are formed with base and/or supplementary units.

Quantity	Name	Symbol	Equivalent to __
force	newton	N	$kg \cdot m/s^2$
pressure	pascal	Pa	N/m^2
work, energy, quantity of heat	joule	J	N•m
power, heat flow rate	watt	W	J/s
quantity of electricity	coulomb	C	A•s
electrical potential	volt	V	V/A
electric resistance	ohm	Ω	V/A
electric capacitance	farad	F	C/V
electric conductance	siemens	S	A/V
magnetic flux	weber	Wb	V•s
inductance	henry	H	Wb/A
magnetic flux density	tesla	T	Wb/m^2
frequency	hertz	Hz	1/s
luminous flux	lumen	lm	cd•sr
illuminance	lux	lx	lm/m^2
activity	becquerel	Bq	1/s
absorbed dose	gray	Gy	J/kg

Common Prefixes



Prefix	Symbol	Means Multiple by	Or by
mega	M	1,000,000	10^6
kilo	k	1,000	10^3
hecto*	h	100	10^2
deka*	da	10	10
deci*	d	0.1	10^{-1}
centi*	c	0.01	10^{-2}
milli	m	0.001	10^{-3}
micro	u	0.000,000,1	10^{-6}

*should be avoided when possible

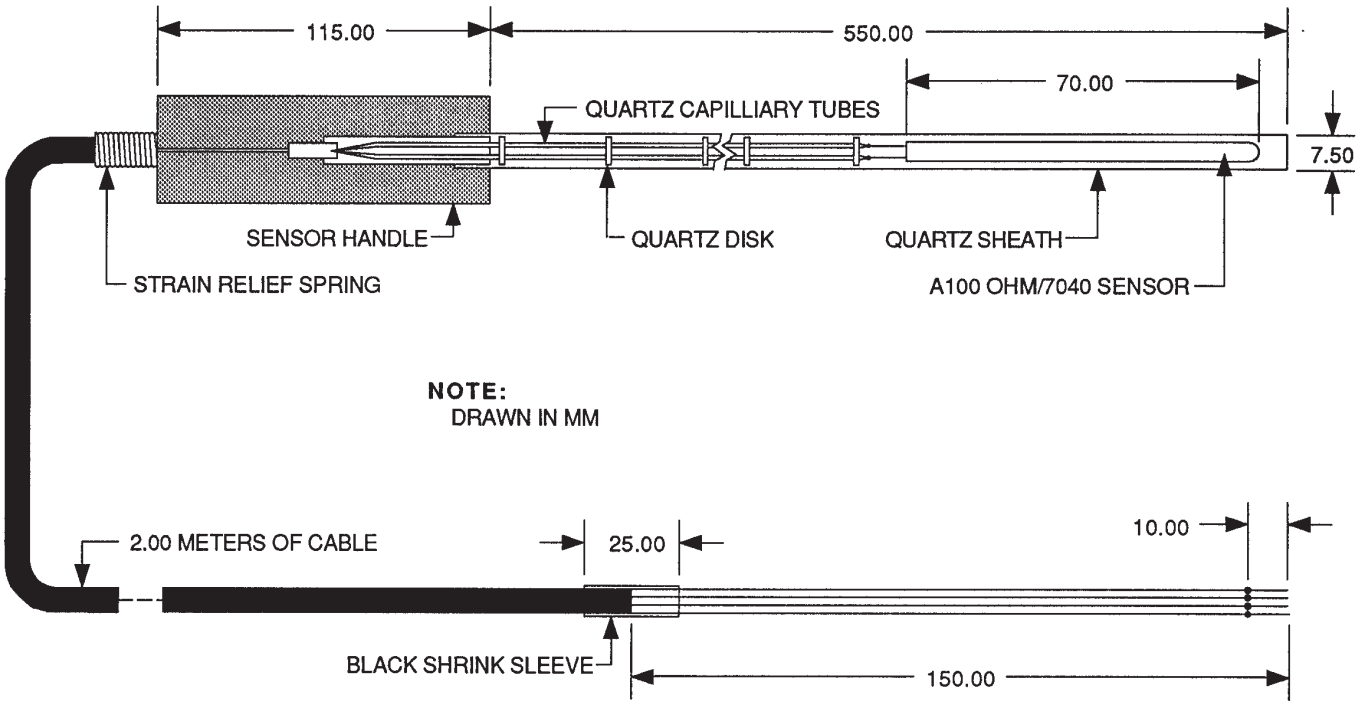
JMS Southeast endeavors to manufacture very unique sensors to satisfy our customers' application needs. If you don't find the sensor you desire, please contact JMS for assistance.

CUSTOM DESIGN OFF THE SHELF TIME!

For other types of sensors/transducers (infrared, mercury and glass, bimetals, etc.) not manufactured by but available through JMS, See Section 10.

JMS offers 7 different reference probes for laboratory use...

STANDARD PLATINUM RESISTANCE THERMOMETERS



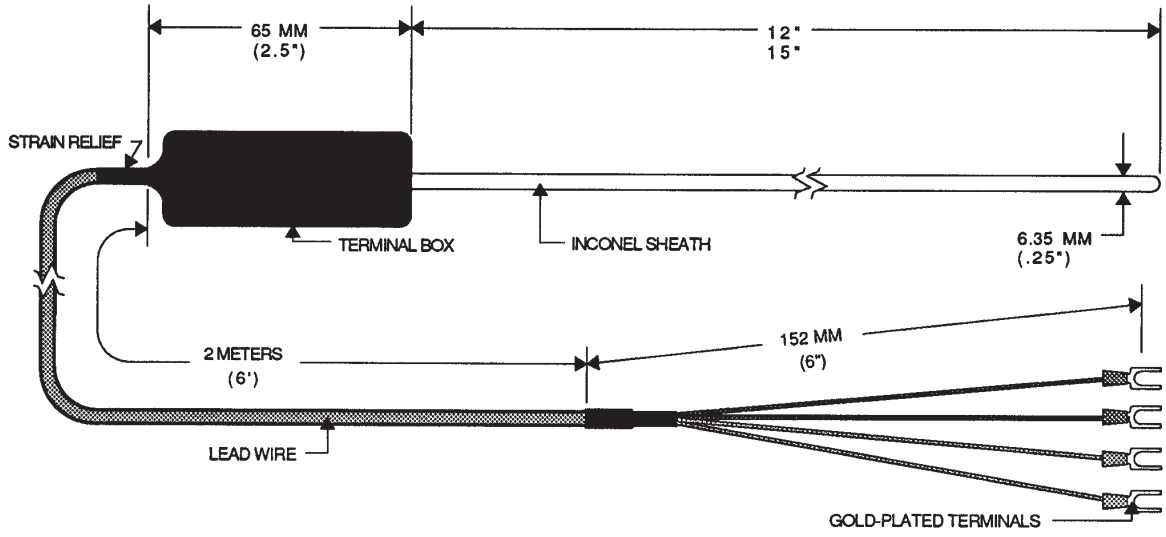
The first and most accurate of the laboratory probes is the SPRT. It has the tightest specifications and is also the most fragile and expensive. Typical drift rates are about 0.001°K annually or about 0.002°C after 100 hours at 660°C.

The SPRT allows the user to realize ITS 90. Our most common unit is the 4ZP model which allows the realization from the boiling point of nitrogen (-195.798°C) to the zinc freezing point (419.527°C). The JMS 4AP unit allows the user to realize ITS 90 from 0°C to the freezing point of aluminum (660.323°C).

Model # [3-21]	R@0°C*	Alpha Coefficient*
4ZP25.5C**	25.5Ω	.003925
4ZP100C**	100Ω	.003925
4AP25.5**	25.5Ω	.003925

* Calibration report will document the exact numbers along with the TPW/MPG ratios.

** The "C" in the part number indicates we will provide calibration. If you intend to send the probe to NIST or some other lab for calibration / certificate, omit the "C"

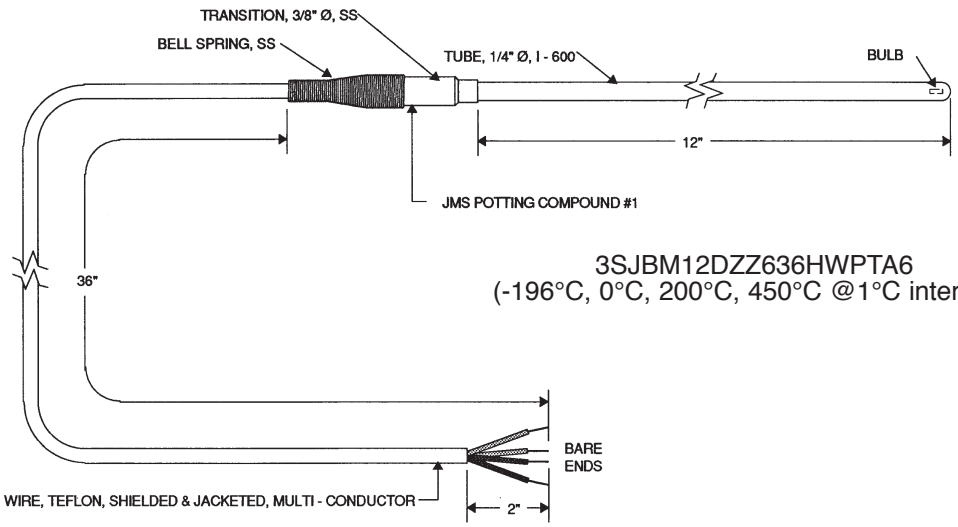


Note: ITS 90 says that an SPRT should have a resistance at melting point of gallium greater than 1.11807 times it's water triple point resistance. That means that you should not use an RTD with a 0.00385 alpha coefficient as an SPRT. However the experience of JMS Southeast indicates that they are great as secondary standards and are described on the following pages.

SECONDARY STANDARD RTD'S

These sensors are intended to be used as the standard for a working laboratory. For instance, JMS uses these types of probes as the reference for our day to day comparison calibrations done on the sensors you use in your processes. We use the SPRT mentioned on the previous page to calibrate and validate this secondary standard.

The secondary standard covers the full range from -200°C to 660°C. It is only slightly more drift prone than the SPRT. (<0.003°C per year or <0.005°C after 500 hours @ 600°C (estimated)) It is much more rugged than the SPRT it has an Inconel 600 sheath, which might not break if dropped on a laboratory floor.



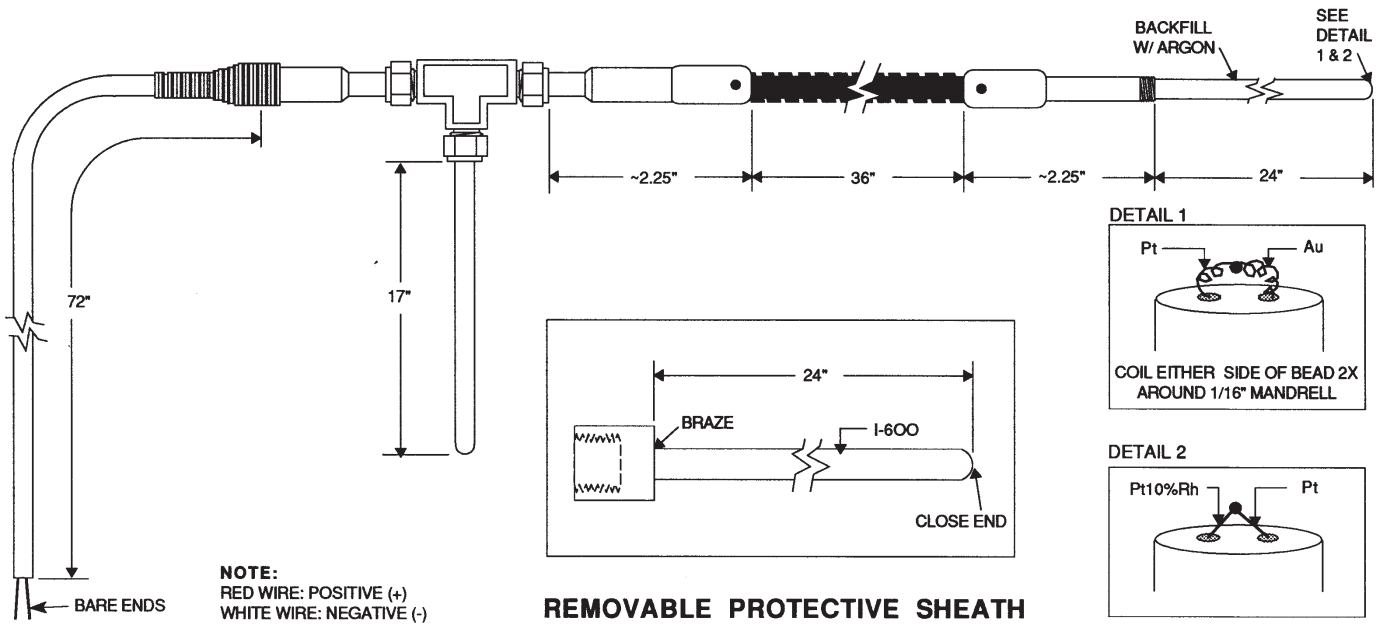
It can be manufactured to any length using the following part numbers:

4SS (length in inches) 25.5 C* (25.5Ω@0°C)
4SS (length in inches) 100 C* (100Ω@0°C)

*indicates a standard calibration will be done using 5 points between -200°C and 600°C. If you intend to send to another lab for calibration, omit the "C".

PRECISION INDUSTRIAL RTD

Our Precision Industrial RTD can be specified by using the pages from the regular RTD section. They can be made in almost any size or shape.



3SJBM12DZZ636HWPTA6
(-196°C, 0°C, 200°C, 450°C @1°C intervals)

JMS STANDARDS THERMOCOUPLE

IPTS 68 allowed the use of type S thermocouples as a method to realize the temperatures above the range of an RTD. ITS 90 does not speak to the use of thermocouples, but they are recognized by many labs as a secondary standard and are great for comparison calibrations. ASTM and NIST still and will continue to recognize the use of Pt/Au and Pt/PtRh in laboratories, and NIST has defined the millivolt tables (Seebeck Coefficients) which are included in section 1 of this catalog. These tables are taken from ASTM E-1751 and ASTM E-230.

Use the appropriate drawing number to order.

These two referenced sensors are an excellent choice for comparing calibration equations in an industrial facility. An accurate and traceable millivolt meter plus one of these probes is all you need to do a totally accurate and effective standards traceable calibration.

Comparison of compositions of probes

JMS Part #4PTAUC*	JMS Part #4PTRHC*
Pt/Au	Pt/PtRh
0 - 1000°C	0 - 1450°C
Non alloyed metals	Higher range
Calibration extremely close to standard	
±0.2°C or better	±1.0°C or better

*A calibration is supplied with any probe and for no calibration, omit the C in the part #.

See Section 1 for temperature / EMF Tables.

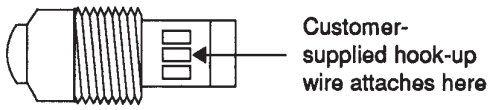
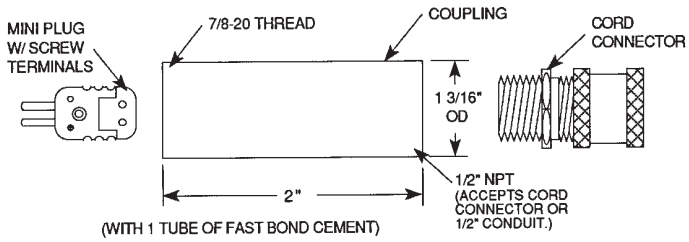
ANALOG BEMOMETER

Unites Bimetal with Either Thermocouple or RTD Technology!



- **Bimetal Dependability**
- **Thermocouple / RTD Accuracy**
- **Direct AND Electronic Reading**
- **Easy To Use**
- **Easy To Calibrate**
- **Two Sensors in One Instrument**

Thermocouple Connection



Subminiature T/C Plug
(Shown with cover off)

RTD Terminal Block Connection (3 pos.)

Permanent Wiring Kit

Detail A

Detail B

This thermometer combines the convenience, simplicity, and self-powered actuation of a bimetal thermometer with the digital accuracy and data acquisition capabilities of a thermocouple or RTD. With standards traceable to the NIST, this new instrument offers simplified calibration for ISO 9000 compliance and other statistical process control requirements. It is also ideal in applications requiring easy and quick readability while still affording a means of electronic data acquisition. There is no need to add access points or thermowells to your existing process in order to gain different types or readings. Plus two temperature sensors to work at each location.

This is available with a 3" or 5" dial, in a Back Connected or Adjustable angle case, 1/4" stem diameter in lengths to 12", 1/2" NPT connection, in ranges from -100°F (-70°C) to 500°F (260°C), with Fahrenheit, Celsius and Dual Scale Dials available. Thermocouple output may be accessed via a plug-in connector; RTD output is accessed by a terminal block. Both have 1/2" conduit threaded mounting and a plastic cap standard. Optional weatherproof housing is available. Construction is of type 304 series stainless steel with a glass crystal. It is hermetically sealed per ASME B40.3 standard. It also comes with a one-year warranty.

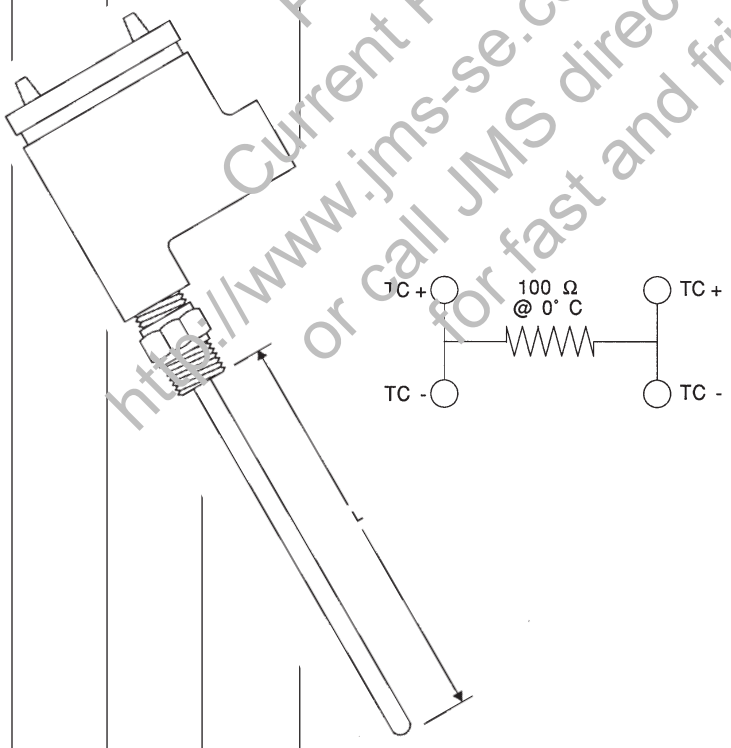
COMBINATION THERMOCOUPLES AND RTD'S

JMS Southeast, Inc., manufactures a sensor that contains both a thermocouple and an RTD. The standard design allows the user to check and validate readings with one sensor while using another type for control or monitoring. Although two thermocouples can be used simultaneously, it is not advisable to use the thermocouple and RTD at the same time.

This type of sensor can be used in applications that require two different inputs. One advantage of this system is that the conditions which adversely affect a thermocouple may not affect the RTD and vice versa. Therefore, combination sensors provide a back-up sensor in the same probe. In extremely high temperature applications, this procedure is not recommended. JMS Southeast can also manufacture triple elements of just about any combination. Contact JMS for details.



There are three types of popular transmitters which accept this sensor directly. We recommend our 8B (AI-2000) and the 8A (AI-1000).

BRUSH THERMOCOUPLES

SECTION 4

The JMS Brush Thermocouple can be used in applications in which a surface temperature of a stationary or moving electrically conducting surface is needed.

True temperature measurement of a surface is very hard to obtain. Previous designs called for the probe to fully contact with as small a junction as possible, spring load with as even pressure as possible, insulate around the surface to be measured, or combinations of all these methods.

All of the above methods have proven to have their own particular faults. When compared to an infrared sensor, which does accurately measure surface temperature (unit must have correct emissivity adjustment), most of these above mentioned sensors either read much hotter or colder than the infrared. However, even the infrared style exhibits problems when emissivity levels fall beneath .4 or less (most metallic surfaces).

JMS has applied for a patent on this brush sensor because of its unique design and widespread application, i.e., molds, rolls, bearings, nozzles, plates, dies, engines, etc., it is usually preferred in a hand held design, but can be adapted for permanent mounting.

Standard calibration for this sensor is usually K because of its resistance to corrosion and stiffness. But any type thermocouple may utilize this design. Call or write for further information.

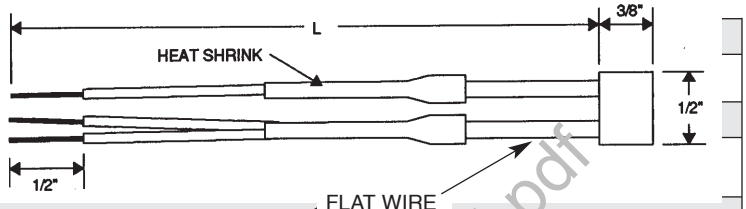
PAD RTD'S

The JMS pad RTD is a speciality sensor which provides a fast response surface measurement. It is a 100 ohm platinum RTD with an alpha of .00385 Ω/Ω/°C. Pad material is fiberglass coated with a silicon rubber.



The pad RTD has an effective operating range from -200°C to 250°C and its tolerance is .1%. Additional teflon leadwire is configured as a 3 wire RTD.

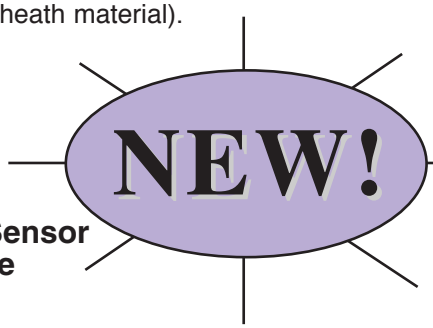
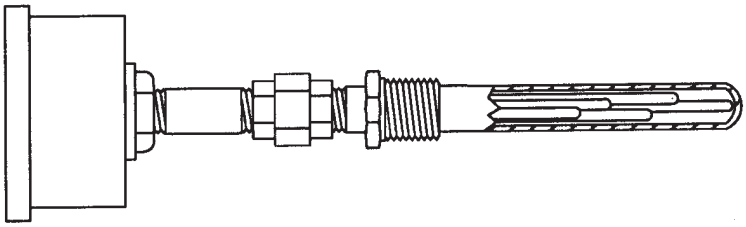
MULTIPOINT SENSOR ASSEMBLIES

A multipoint sensor allows the measurement of a temperature profile across a large area. Thermocouples or RTD's are arranged with measuring junctions at various points along a pipe, allowing the measurement of various points from a complete assembly.

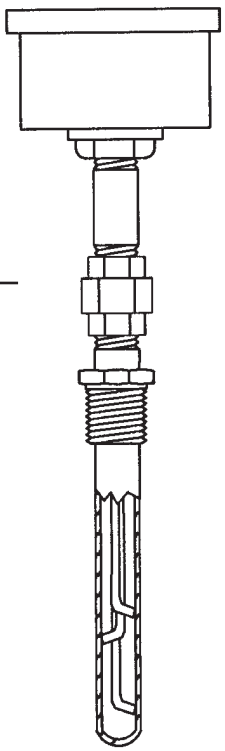


Many elements can be spaced along a probe. This opens up possibilities for improved profiling in catalytic reactors, for example, where flow interference prevents inserting large numbers of individual probes.

Multipoint probes can also be used to give a temperature profile where stratification of a tanks contents may be of concern.



JMS will custom design your assembly to give you the most accurate temperature measurement for your process.



The following information and/or drawing is needed to properly design your assembly.

—Thermocouple calibration or RTD element type
—Outside diameter of pipe and pipe material.
—Number of elements required and lengths.
—Junction style of thermocouple.
—Sensor material (base wire, 316 SS tubing, or sheath material).
—Overall length of the entire assembly.
—Process connection.
—Accuracy required.
—Cold-end termination.
—Maximum operating temperature.

Removable / Replaceable Sensor Design - Now Available

Note: JMS has a proprietary design which assures consistent response time for each probe, plus removability for recalibration. Call and ask about it!

SURFACE PROBES

JMS offers this standard surface probe as an option to the brush sensor (also included in this section) for surface temperature measurements.

Most all of these types of probes have a common weakness. Since the tips must remain in contact with the surface being measured, the tips are prone to damage and failure. Unlike our competitors, our design allows you to easily replace the tip and get back to business.

3A APPROVED SANITARY SENSORS

CIP (clean-in-place) line of 3-A certified sanitary thermocouples and RTD's from JMS are specially designed to meet the needs of the food, dairy, beverage, pharmaceutical, chemical and cosmetic industries. They are ideally suited for a number of applications where corrosion and contamination are factors. They are fabricated from stainless steel using a method assuring imperfection-free surfaces.

Units may be supplied utilizing sanitary caps from Alloy Products, Cherry-Burrell or Lapish Tri-Clover, or spring loaded fittings in sanitary thermowells. Each design is polished to a No. 4 finish to assure that there are no pits, folds or crevices. The exterior nipple, also stainless steel, can be joined to a coated or plastic connection head, designed to withstand caustic washdown. A typical RTD or Thermocouple may be used with a sanitary thermowell, see pages 1-1 and 3-1.

CONTINUOUS THERMOCOUPLE TRANSDUCER CABLE

FTLD® - The Heat-Seeking Thermocouple

SECTION 4

Introduction

The FLTD Continuous Thermocouple® is a temperature measuring sensor, which takes the form of a thin flexible cable. Like its predecessor CT²C®, it is a heat-seeking thermocouple, using similar thermo-electric techniques, but designed especially to reveal changes in the narrow band of temperatures only a few degrees above normal ambient.

FTLD is able to measure the maximum temperature detected between its two ends, then track any increase, even if the position of the "hot-spot" changes. Such ability offers an immense opportunity to prevent loss due to overheat, in commercial as well as industrial applications.

This advanced form of dector permits the design of overheat warning systems, which are highly sensitive to early departures from normal, yet exhibit an extraordinary freedom from false alarms.

Operating Principle

A Circuit formed from two dissimilar wires joined at both ends, develops an emf (voltage) proportional to the difference in the two junction temperatures. This is the long established Thermo-electric effect, and today the junctions are known as the "Measuring Junction". See diagrams below.

Although an FTLD sensor performs like a normal thermocouple, the measuring junction is not formed by directly joining the two wires. More remarkably, the Measuring Junction is not fixed, but becomes concentrated at the hottest point within the insulation resistance when subjected to an increase in temperature.

The nature of the insulation causing this phenomenon is such that the voltage developed between the two wires always relates to the highest temperature along the cable sheath.

Features

Stable

Moisture resistant

Sensor needs no power

Virtually free from false alarms

Ambient temperature compensation

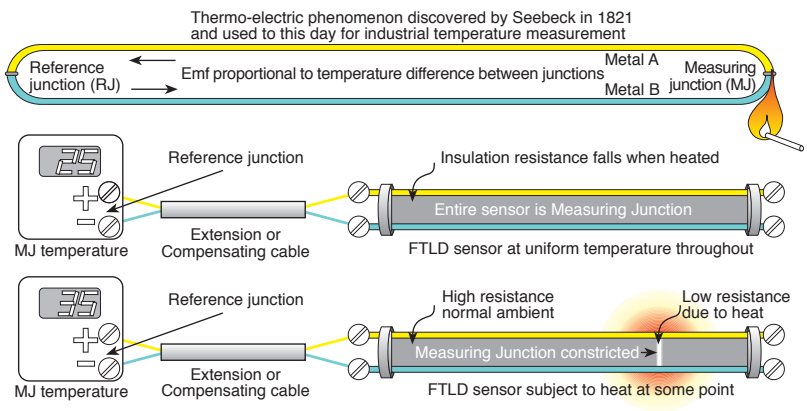
Early warning of abnormal temperature

Alarm point unaffected by cold weather

Simple apparatus (Hazardous Area)

User adjustable alarm settings

No site calibration



Advantages

Self-generating temperature sensor
Measures maximum temperature
Initial site temperature check not needed
Visible operating status
Optional rate of change alarm (same unit)
Alarm settings directly in degrees
Alarms can be set before installation
Interchangeable sensors
Sensor not microphonic
System check facility in sub zero band
Alarm units for mains power or low voltage
Sensor need not be near alarm unit

Specification

Protective sheath -	Dual layer PTFE
Measuring element -	Type "K" thermocouple - insulated
Sensor output -	Millivolts DC related to maximum cable temperature
Normal operating range -	-29 to 80°C (-20 to 176°F)
Survival range -	-40 to 200°C (-40 to 392°F)
EMI protection -	Twisted cores & metallised tape tube
Insulation -	Glass fibre impregnated with special insulating material
Minimum bend radius -	40 mm
Construction -	Twisted pair, NTC insulation, EMI screen, outer sheath
Sizes -	3.5mm OD approx. Cut to length as required
Minimum length -	15 meters
Hazardous area use -	Measuring element is "Simple Apparatus"

FTLD® - System Operating Principle

By measuring both the sensor output and the temperature at its own terminals the instrument is able to compute the hot spot temperature and make automatic compensation for ambient temperature changes

FTLD® - Prevention of Loss due to Overheat

Think of your sphere of work, look around you - is there more you can do?

The Application

Temperature rise due to unrestrained release of physical or chemical energy, is a regular cause of serious loss in industry, commerce and everyday life. It is responsible for countless incidents, the financial consequences of which range from minor to catastrophic.

One common example of temperature rise ending in loss, is combustion. Some others are wear, distortion, fracture, melting, drying, and seizure.

Breakdown at temperatures well below the boiling point of water, is an area of particular concern - one where losses from shutdown can be enormous. For example, temperatures at which ordinary heat detectors remain dormant, can destroy the electronics crucial to computers, communications and data handling equipment.

For many years point type temperature detectors of various types, including conventional thermocouples, have been used to monitor processes and plant risk from heat induced damage. In almost every case the inevitable compromise between numbers (cost), and detector coverage (efficiency), has defeated the exercise.

FTLD offers a very powerful and cost effective alternative to any currently available system, by eliminating the question of where to place the sensor; by constantly monitoring maximum temperature in the area covered; and by possessing such stability, that false alarms are virtually non-existent.

Very often, a loss-inducing condition begins with temperature rising very slowly above normal for the installation at risk. This is the time when corrective action has the greatest chance of success. An FTLD system capitalizes on this opportunity by alerting operating personnel to the onset of a dangerous condition, some time before the main danger temperature alarm is initiated.

3-A CERTIFIED SANITARY THERMOWELLS

Designed to be used with the sanitary 3-A certified probes (pages 4-13 and 4-14) these thermowells may be welded to a tank or vat with a full crevice-free fillet weld to avoid cracks or crevices. Each well is fabricated from Type 304 stainless steel and polished to a No. 4 finish. Use standard thermocouples and RTD's with these thermowells (1-1 and 1-3 , 2-1 and 2-2).

SECTION 5

CERAMIC PROTECTION TUBES

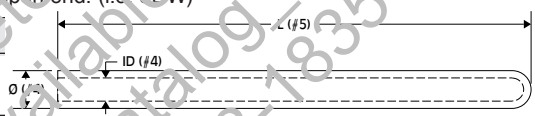
Alumina and mullite protection tubes are used at high temperatures that have a small slope of temperature change. Any thermocouple type can be used in these ceramic tubes; however, platinum-rhodium and chromel-alumel are used most often due to their high operating temperature range. "Alumina" is an alumina oxide ceramic (99.7% Al2O3) and "mullite" is a compound of alumina and silica. Alumina tubes can be used at 3400°F (1870°C) and mullite tubes can be used at 3100°F (1700°C). They are somewhat gas tight, sensitive to thermal shock, and can crack if one end of the tube is heated at a different rate than the other. If the tube is exposed to a significant sharp decline or rise in temperature, the tube may crack.

Platinum-Rhodium thermocouples should always be protected in a ceramic protection tube. Alumina should be used rather than mullite for all atmospheres except oxidizing, where mullite can be used. The silicon from the mullite can contaminate the platinum-rhodium thermocouple.

We recommend that the user preheat the entire tube to ≈ 900°F before installing it into a hot process environment.

#1	SERIES
5D	Ceramic Protection Tubes - Add "W" here for a cap and chain to fit over open end. (i.e. 5DW)

#2	MATERIAL
A	Alumina
M	Mullite



#3	ATTACHING DEVICE
O	No mounting fitting
P	Open both ends, no mounting fitting
C	Collar* (See chart below for collar dimensions)
B	Mounting bushing (Standard)
S	Carbon steel mounting sleeve - (4" long sleeve is standard)
X	Other, specify

#4	TUBE SIZE I.D. x O.D.	*COLLAR OUTSIDE FOR APPROPRIATE TUBE SIZE
14	1/4" x 3/8"	5/8"
38	3/8" x 1/2"	3/4"

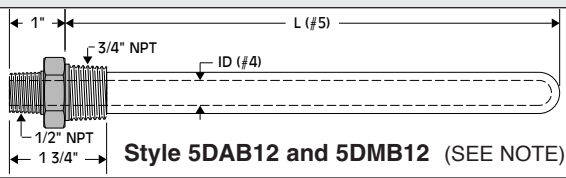
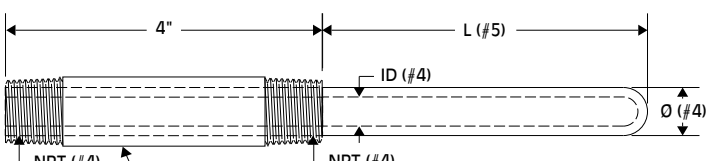
#6	TAGGING OPTIONS	
STAMPING	1	Stamped on well (**Standard**)
	X	Other
	Z	N/A **Note:** You must always specify information required on tag



Style 5DAO and 5DMO



Style 5DAC and 5DMC

Style 5DAB12 and 5DMB12 (SEE NOTE)

NOTE:
Bushings are always 1/2" NPT head connection, and 3/4" NPT process connection.
Bushings are not standard for 3/4" x 1" or 1" x 1 1/4" ceramic tubes.
For tubes smaller than 11/16" OD, the "L" length will equal the total length including the bushing.

CS sleeve for tube NPT will equal tube OD (ie: 1" OD will use 1" NPT threads). It can be used to attach adjustable flanges and bushings as shown on page 5-7. Use "X" in symbol number 3 and describe.

MULLITE/ALUMINA PROTECTION TUBES

The composition of this tube is 80% alumina and 20% silica. This protection tube has excellent thermal shock characteristics (3.0 x 10 -6 in/in/ degrees F). It can be characterized as a mullite tube with a higher percentage of alumina than a typical mullite tube would have. It has an outer diameter of 3/4" and an inner diameter of 1/2". It is a light green color. When fully supported, the tube can be exposed to 2900 degrees F. This protection tube is a compromise between mullite and alumina yielding a high quality ceramic tube with excellent thermal shock resistance. Due to the silica content, a platinum/rhodium thermocouple should not be used in it without a primary alumina tube to insulate the thermocouple.

#1	SERIES
59	Mullite / Alumina Ceramic Protection Tube - Add "W" here for a cap and chain to fit over open end. (i.e. 59W)

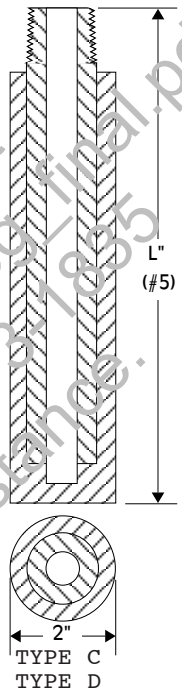
BONDED SILICON CARBIDE PROTECTION TUBES



Silicon carbide protection tubes provide excellent thermal conductivity for quick response to temperature changes. They can be used to replace cast iron tubes, eliminating the possibility of iron pick-up. Spread surface treatment assures adequate protection of the thermocouple.

JMS Southeast offers two types of silicon carbide protection tubes. Type A and B are dense silica bonded silicon carbide and are manufactured with a flange or a plain end as the following drawings indicate.

Type C and D are carbon bonded silicon carbide and graphite. They are manufactured with a black steel pipe located down the center. They have a 1/2" or 3/4" NPT connection to thread into place instead of a flange for mounting as Type A.

The information contained in this data sheet has been determined through the application of accepted engineering practice and is believed to be reliable. Since the conditions of application and use of our products are beyond our control, no warranty is expressed or implied regarding accuracy of the information, the results to be obtained from the use of the product, or that such use will not infringe on any patent. This information is furnished with the express condition that you will make your own tests to determine the suitability of the product for your particular use.

SILICON NITRIDE PROTECTION TUBE

SIALON

JMS Southeast, Inc. offers a protection tube for use in molten non-ferrus materials such as molten aluminum, brass, and copper. This special JMS protection tube material is a solid solution of alumina oxide in silicon nitride. Maximum temperature is 1250°C (2280°F) in molten metals. The physical properties are shown below.

TYPICAL PHYSICAL PROPERTIES (SIALON)

Bulk Density		(g/cm^3)	3.25
App. Specific Gravity		(g/cm^3)	3.26
Porosity		(%)	<1
Cold Bend Strength	(25°C)	(MPa)	945
		(kpsi)	137
Hot Bend Strength	(1200°C)	(MPa)	560
		(kpsi)	81
Elastic Modulus		(GPa)	288
		(x 10^6 psi)	42
Ther. Exp. Coeff. (20-1000°C)		(x 10^{-6}°C^{-1})	3.04
Thermal Conduct	(400°C)	(W/mK)	21.3
Critical ΔT		(°C)	950
Hardness (VRN, 1 kg Load)			1650

Obsolete Part Numbers

4	30" (**Standard**)
5	36"
6	48" (**Standard**)
X	Other, specify

Note: Length measured from bottom of threads to closed end.

5G	3	

The MCPT consists of a hard abrasion-resistant chromium and alumina oxide material. It has good strength at temperatures where many high-temperature metals melt. It is more susceptible to thermal shock than a metal protection tube, however, more resistant to shock than a ceramic protection tube.

The MCPT exhibits good wear resistance and abrasion resistance. It has a hardness of Rockwell C37, which indicates the crushing strength of the material rather than the true hardness of the entire body.

This protection tube serves as an excellent option in the following applications:

RECOMMENDED APPLICATIONS

1. Molten copper and brass to 2100°F intermittent and continuous immersions.
2. Corrosive SO_2 and SO_3 gas (to 2200°F) and SO_3 and HF gas (to 2000°F).
3. Open hearth furnace checker chambers to 2200°F.
4. Steel mill soaking pits to 2200°F.
5. Pelletizing chamber of Taconite refining operation to 2100°F.
6. Molten zinc to 1600°F.
7. Molten lead to 650°F.
8. Basic steels and slags to 300°F (intermittent and 2200°F (continuous in open hearth and general foundry practices).
9. Calcining kilns to 2200°F.
10. Barium titanate (barium oxide service to 2200°F).
11. Magnesium oxide calcining kilns.
12. Fluid bed cement process with severe corrosion and temperature to 2200°F (fluid method of producing builder's cement).
13. Gas and ethylene cracking atmosphere.
14. Atmosphere directly upon burning sodium (1800-2200°F).
15. Oil fired furnace chambers.
16. Atmosphere directly above molten glass in an open hearth glass furnace.
17. Molten silver solder.
18. Molten tin.
19. Borax flux.
20. Copper matte.
21. Boiling sulphuric acid-97%.
22. Blast furnace stove dome and bustle pipes.

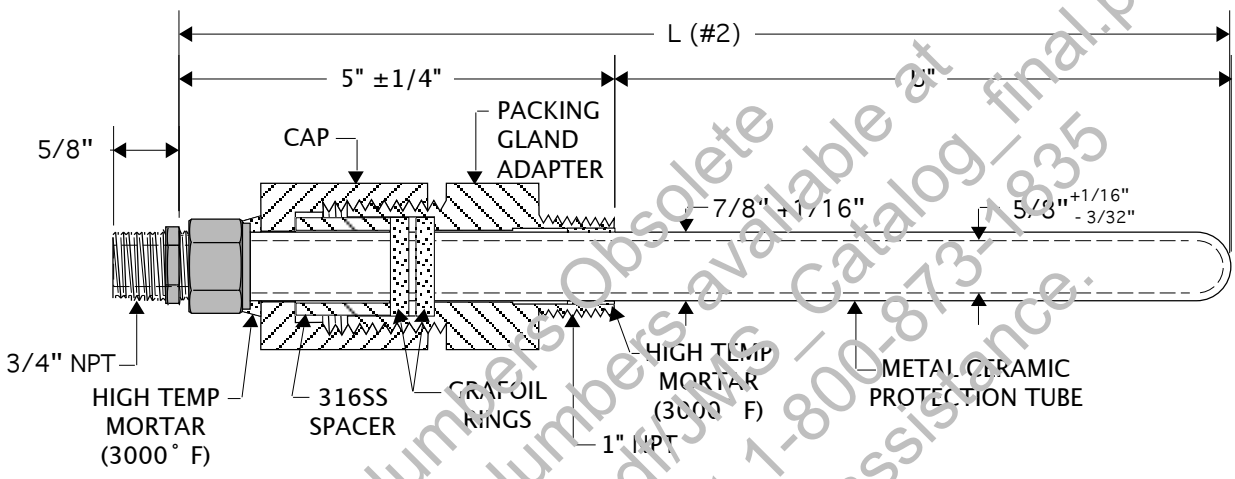
NON-RECOMMENDED APPLICATIONS

1. Molten aluminum.
2. Cryolite.
3. Tin (stannous) chloride (750°F).
4. Acid slag.
5. Carbide slag.
6. Molten glass.
7. Boiling sulphuric acid-10%.
8. Carburizing atmospheres.
9. Nitriditing atmospheres.
10. Barium chloride salt bath.
11. Sodium Nitrate-nitrate salt bath.

This protection tube is most commonly used in molten metal applications. It is less common than ceramic and metal protection tubes in industrial application.

—5/8" I.D. x 7.8" O.D., 3/4" conduit connector.
—Any length.
—Accepts 8 gauge wire or smaller
—Superior oxidation resistance up to 2200°F.
—Above 2800°F, softening begins.
—Suggested pre-heating of tube to 900°F if application involves immersion in molten metal 2000°F or higher.
—Impermeable except under high vacuum.
—Maximum recommended continuous operating temperature is 2500°F.

Note: A special fitting is available that is recommended for extreme conditions. See page 5-14 for additional information.



*UCAR® LT-1 Metal Ceramic is a product of Union Carbide Corp.

5J	3	

GENERAL THERMOWELL INFORMATION

THERMOWELLS

Process Connection

Provides a means of mounting, supporting, and/or sealing the thermowell into the process system.

Types:

Threaded: Standard N.P.T.'s are 1/2", 3/4", and 1".
Socket Weld: Standard pipe sizes are 3/4" and 1" nominal. JMS socket wells are 3000lb rated. Other rating must be separately specified.
Flanged Welded: Large variety of flange sizes and pound ratings available.

Shank Construction

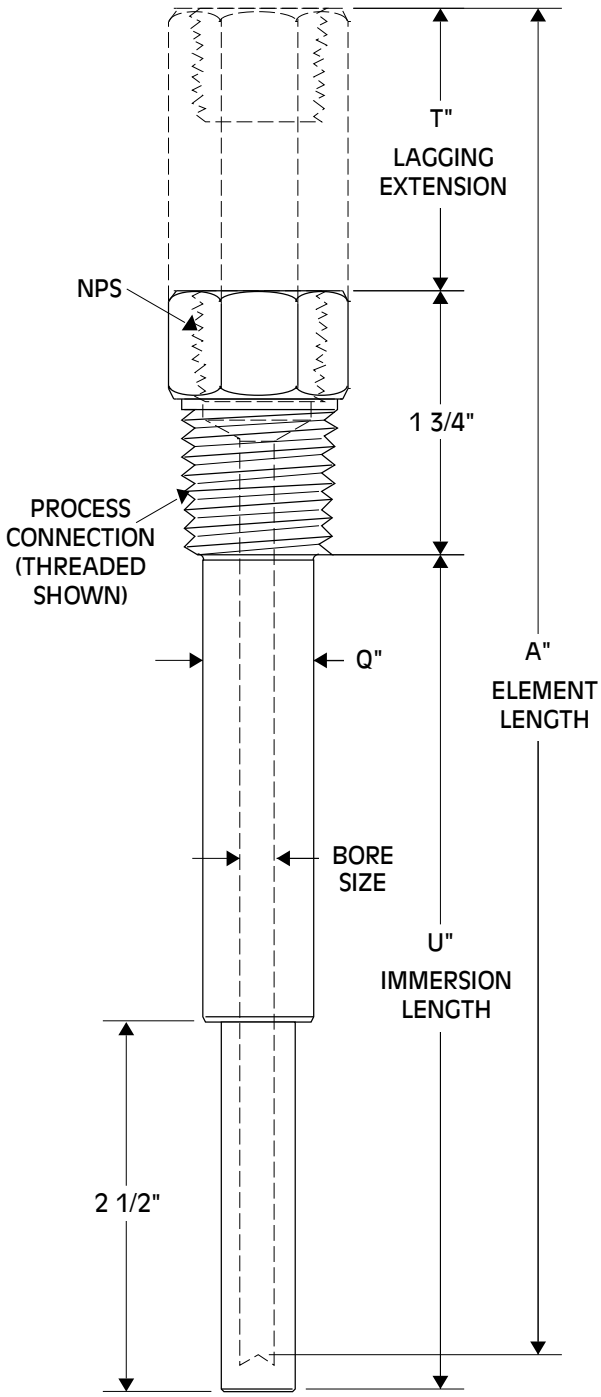
Straight: The outside diameter is the same size along the immersion length.
Step: The outside diameter at the end of the well is 1/2" to provide quicker response time.

Tapered: Used for high velocity applications. The outside diameter decreases gradually along the immersion length.

Q Dimension

The thickest part of the shank of the well on the hot side of the process con nection or flange. Its dependent on the bore size and the process connection size.

Bore Size



The inside diameter of a thermowell. Standard bore sizes are .260 and .385.

Immersion ("U") Length

Immersion length of the thermowell. The "U" length is measured from the bottom of the process connection to the tip of the thermowell.

Lagging Extension ("T") Length

The lagging extension exists behind the process connection and is used to extend the hex length and enable the probe to extend through insulation or walls.

Note:
JMS has a complete design guide on disc for your use. Call and ask for the Thermowell Design Guide.

Note: Design program on page 5-17.

STANDARD THERMOWELL MANUFACTURING TOLERANCES

JMS Thermowells meet or exceed the following standards:
(Copies are available from JMS Southeast, Inc., ANSI, or the issuing body.)

ASME B40.9 - Thermowells for Thermometer and Electrical Temperature Sensors
SAMA RC17-10-1963 - Bushings and Wells for Temperature Sensing Elements
ISA 1.02.01 - Thermowells
IEC 61520 - Functional Dimensions of Metal Thermowells for Thermometer Sensors

The following specifications are for .260 and .385 bore thermowells:
Lengths: ±1/16" on lengths 12" or less
±1/8" on lengths 12" or over
Wells up to 38" bore depths are drilled from solid bar stock to specified tip thickness (1/4" standard). A built-up design is necessary after 38 1/4" overall length.

Bore I.D. Tolerance:
±.001

O.D. Tolerances:
Fractional: ±.015
Decimal: ± .005 on .000 place
± .010 on .00 place

Concentricity of Bore to O.D.:
± 10% of minimum wall thickness

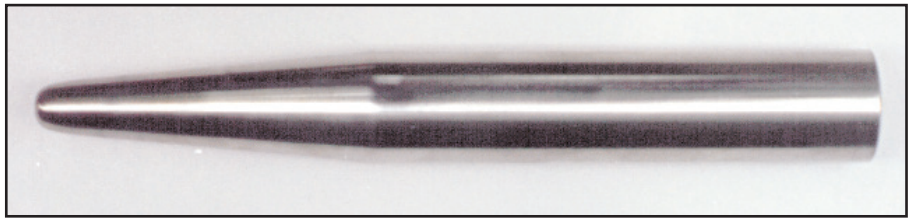
End Thickness:
Gun drill bottom, 1/4" ± 1/16".

Male Threads (NPT):
± 1 turn of thread gauge

Female Threads:
1/2" NPS standard, 1/2" NPT available upon request

Radius Under Threads and Flanges:
1/8" is standard, ± 1/16"
1/16" on Van Stone

Lagging Extension:
Lagging on wells is left as hex and is not turned. For material not available in hex, round bars with wrench flats will be furnished.



End of Wells:
Break corners. No burrs.

Wetted Surfaces Finish for "U" Dimension
63 ST is our standard surface finish. A mirror polish is available upon request. 8 RMS is our standard for a mirror polish, and must be specified on the order. Electropolish or electroplating is also available. There is an additional charge for mirror, electropolish or electroplating.

Stamping:
Material code and type of material is stamped on hex or round.

Flanged Wells:
Made in accordance with ANSI B16.5 with serrated raised face. We also furnish 125 RMS smooth face which must be specified when needed. Other surface finishes are available upon request.

Weld Configuration:
Front groove welds are 1/4" wide by 5/16" deep. Rear groove welds are 1/8" wide by 1/8" deep "V". Welds are machined, leaving 1/4" radius. Full penetration welds are available upon request.

Design Procedure***

The purpose of this design procedure is to enable the user to determine if a well selected for thermometry considerations is strong enough to withstand specific application conditions of temperature, pressure, velocity, and vibration. Well failures are caused by forces imposed by static pressure, steady state flow, and vibration. Separate evaluations of each of the above effects should be made in order to determine the limiting condition. This design procedure does not allow for effects due to corrosion or erosion.

The natural frequency of a well designed in accordance with Fig. 1.1 and of the dimensions given in Table 1.1 is given by the following equation:

$$f_n = \frac{K_f}{L^2}\sqrt{\frac{E}{\gamma}} \quad \ldots\ldots [1]$$

where

f_n = natural frequency of the well at use temperature, cycles per sec

L = length of well as given in Fig. 1.1, in.

E = modulus of elasticity of well material at use temerature, psi

γ = specific weight of well material at use temperature, lb per cu in.

K_f = a constant obtained from Table 1.2

The wake or Strouhal frequency is given by:

$$f_w = 2.64\frac{V}{B} \quad \ldots\ldots [2]$$

where

f_w = wake frequency, cycles per sec

V = fluid velocity, fps

B = diameter at tip (Fig. 1.1), in.

The ratio of wake to natural frequency (f_w/f_n) shall not exceed 0.8, and when this condition is met, the Magnification Factor, relationship of dynamic to static amplitude is given by:

$$F_M = \frac{(f_w/f_n)^2}{1-(f_w/f_n)^2} = \frac{r^2}{1-r^2} \quad \ldots\ldots [3]$$

For $r \leq 0.8$

where

F_M = magnification factor, dimensionless

r = frequency ratio, (fw/fn), dimensionless

STRESS ANALYSIS

The maximum pressure that a thermometer, well can with stand for a given material at a given temperature shall be computed from the following:

$$P = K_1 S \quad \ldots\ldots [4]$$

where

P = maximum allowable static gage pressure, psi

S = allowable stress for material at operating temperature as given in the ASME Boiler and Pressure Vessel or Piping Codes, psi

K_1 = a stress constant obtained from Table 1-3.

The maximum length that a thermometer well can be made for a given service is dependent upon both vibratory and steady state stress. The necessity for keeping the frequency ratio at 0.8 or less imposes one limitation on maximum length. The other limitation is one of steady state stress considerations, as given by the following equation:

$$L_{max} = \frac{K_2}{V}\sqrt{\frac{v(S - K_3 P_0)}{1 + F_M}} \quad \ldots\ldots [5]$$

where

L_{max} = maximum value of L (as shown in Fig. 1.1) for a given service, in.

V = fluid velocity, fps

v = specific volume of the fluid, cu ft per lb.

S = allowable stress for material at operating temperature as given in the ASME Boiler and Pressure vessel or Piping Codes, psi

P_0 = static operating gage pressure, psi

F_M = magnification factor as computed from Eq [3]

K_2, K_3 = stress constants obtained from Table 1-3.

Note:
JMS has a complete design guide on disc for your use. Call and ask for the Thermowell Design Guide.

3 IMPORTANT THINGS TO REMEMBER WHEN ATTEMPTING TO DETERMINE THE INSERTION LENGTH OF A THERMOWELL

THERMOWELL SELECTION CRITERIA

1. Selecting the proper insertion length is critical to the accuracy of your sensor. In considering length, it is important to allow the entire sensitive portion of the sensor to extend into the medium being measured. The proper length for a sensor installed into a liquid is the sensitive portion plus at least 5 x Ø. For gas or air, a probe should be installed a minimum of 10 x Ø plus the sensitive length.

Generally, wire wound RTD's have a sensitive portion around 5/8". Shorter sensitive lengths are available with thin film and ceramic RTD's upon request. Both thermocouples and thermistors have small sensitive lengths so they are the best choice when working with short insertion lengths.

Note: It is important to consider the amount of the well passing through insulation, walls, fittings, etc., when determining the proper insertion length.

2. In selecting a thermowell, vibration is an important variable to be considered. When thermowells fail, they most often fail due to the vibrational effects they encounter. The pressure and temperature of a process does not usually have as much effect on the life of the thermowell as the fluid velocity of the media.

The media, flowing by the well forms a turbulent wake which has a definite frequency based on the diameter of the well and the flow of the fluid. The well must have sufficient stiffness so the wake frequency will never equal the natural frequency of the well itself. The flowing liquid generates a wake frequency around the well called the Von Karman Trail. Ask us about our Thermowell Program.

The tapered thermowell provides greater stiffness for the same sensitivity than straight thermowells.

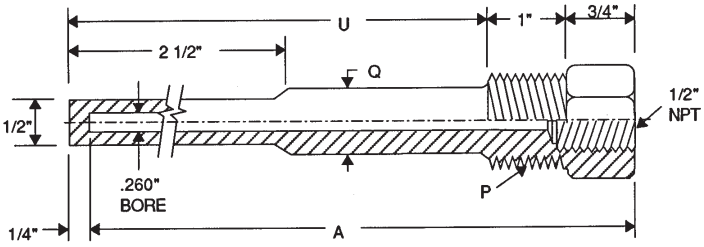
The thermowell material chosen is mainly based on the corrosion conditions of the process and temperature range of the operation.

Pressure and velocity flow tables follow to aid our customers as a guide in the selection of thermowells.

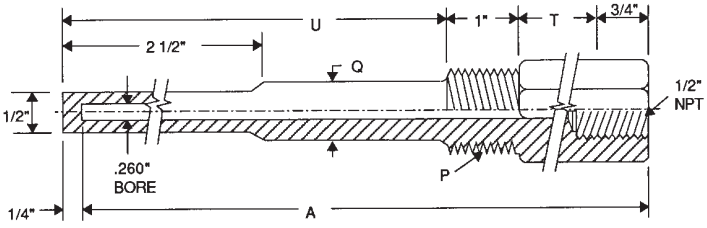
Wells are safe if the resonant frequency is below the natural frequency of the well and if the fluid velocity is changing or fluctuating through the critical velocity point.

The values are very conservative and intended as a guide only.

JMS Southeast will be happy to assist you in the event of questions concerning your application and the selection of thermowells.



3. Ask for our design disk which calculates the stem loss temperature errors and velocity ratings for all common matrials and mounting methods for thermowells.



Note:
JMS has a complete design guide on disc for your use. Call and ask for the Thermowell Design Guide.

NOTE: Burst Pressures for Stainless Steel in above chart were calculated using the specified minimum tensile strength, 75,000 p.s.i.

The information and data presented herein are typical or average values and are not a guarantee of maximum or minimum values. Applications specifically suggested for material described herein are made solely for the purpose of illustration to enable the reader to make his own evaluation and are not intended as warranties, either express or implied, of fitness for these or other purposes.

THEORETICAL BURSTING PRESSURES FOR TUBING (ASTM-A-632)

Corresponding to a fiber stress in wall of 10,000 pounds per square inch

OUTSIDE DIAMETER (INCHES)	WALL THICKNESS - DECIMAL INCH						
	BWG EQUIVALENT						
	.020 25	.028 22	.035 20	.049 18	.065 16	.095 13	.120 11
1/8	3200	5200	5600	7840			
3/16	2133	2987	3933	5227			
1/4	1600	2240	2800	3920	5200	7600	
5/16	1280	1792	2240	3136	4160	6100	
3/8	1057	1493	1867	2613	3467	5067	6400
1/2	800	1120	1400	1960	2600	3800	4800

The table (S=10,000) affords easy calculations with appropriate multipliers shown below. For theoretical bursting pressures, use tensile values. For theoreticalbulging pressures, use yield values. Working pressures will vary depending upon safety factors required for environmental conditions involved as determined by your design engineer and appropriate codes.

Material	Tensile (Multiplier)	Yield (Multiplier)
6061-T6 Aluminum	42,000 psi (x 4.2)	35,000 psi (x3.5)
Annealed Low Carbon Steel	55,000 psi (x 5.5)	25,000 psi (x 2.5)
Annealed 18-8 Stainless	75,000 psi (x 7.5)	30,000 psi (x3.0)
1/8 Hard 18-8 Stainless	105,000 psi (x 10.5)	75,000 psi (x7.5)
Cold Dr. 21-6-9 Stainless	142,000 psi (x 14.2)	120,000 psi (x 12.0)

The above table is based on the best known and most widely used formula for calculating the bursting pressure of tubes, namely Barlow's: $P=\frac{2St}{D}$

P = Internal pressure in p.s.i S = Fiber stress of tube in p.s.i. t = Wall thickness in inches D = Outside diameter in inches

The information and data presented herein are typical of averaging values and are not a guarantee of maximum or minimum values. Applications specifically suggested for material described herein are made solely for the purpose of illustration to enable the reader to make his own evaluation and are not intended as warranties, either express or implied, of fitness for these or other purposes.

MATERIAL SELECTION INFORMATION

The following information is a guide line for selecting thermocouple, RTD and thermowell materials based on the process fluid. Factors such as catalytic reaction, contaminations and electrolysis are taken into consideration. However, in many cases there are even more variables which must be examined.

These suggestions are to be used only as guide lines and are based on the most economical material selection. JMS Southeast will not take any responsibility if these recommendations are not satisfactory for specific applications. Consult JMS Southeast for special applications and our engineering department will assist you in your selection.

MATERIAL SELECTION INFORMATION

METALLIC THERMOWELL MATERIALS

SUMMARY TABLE

DESIGNATION	NOMINAL COMPOSITION	MAXIMUM TEMP. (cont. serv. air)	MELTING POINT
304SS	18% Chromium 9% Nickel	1652°F	2600 - 2750°F
310SS	25% Chromium 20% Nickel	2100°F	2500 - 2550°F
316SS	18% Chromium 12% Nickel 2-3% Molybdenum	1700°F	2500 - 2550°F
304LSS	Similar to 304SS with reduced carbon	800°F	2600 - 2750°F
Inconel 600	76% Nickel 15.5% Chromium 8.0% Iron	2100°F	2470 - 2575°F
Hastelloy B3	65% Nickel 28% Molybdenum 1.5% Cr 1.5% Iron	800°F	2500 - 2585°F
Hastelloy C276	57% Nickel 16% Molybdenum 15.5% Chromium 4% Tungsten 5% Iron	800°F	2415 - 2500°F
Monel	65% Nickel 32% Copper	1000°F	2450°F

MATERIAL SELECTION INFORMATION

COMPARATIVE CORROSION RATINGS

For Carbon Steel, Inconel, Monel, Nickel, 303 Stainless Steel, 304 Stainless Steel, 316 Stainless Steel, and Teflon.

The data in this chart is reprinted here with the permission of Hoke, Inc., One Tenakill Park, Cresskill, New Jersey 07626.

This chart is a guide to the selection of a corrosion resistant protection tube. Changes in temperature, concentration, pressure, agitation, aeration, and impurities can nullify these ratings. The only way to determine the suitability of a protection material in a media is by performance tests. Mechanical strength of the protection tube must also be considered. Unless otherwise marked, all pressures and temperatures are atmospheric. This listing does not imply that other materials are not suitable for use in the media listed.

IDENTIFICATION OF TRADENAMED MATERIALS

Inconel, Monel . . . . . International Nickel Co.
Teflon . . . . . E.I. DuPont

RATINGS

A Substantial Resistance-Preferred material of construction.
B Moderate Resistance-Satisfactory for use under most conditions; very slight swelling for elastomers.
C Questionable Resistance-Use with caution.
D Inadequate Resistance-Not recommended.
X No information available

LIMITATIONS

1. To 220° F.
2. Subject to stress corrosion at high temperatures and in concentrated solutions.
3. Subject to pitting at air solution line when solution is allowed to dry on metal surface.

CERAMIC AND METAL COATINGS

FOR THERMOWELLS, PROTECTION TUBES, AND BARE SENSORS

Increasing numbers of industrial firms are specifying reliable, high quality thermal coating for repair, restoration and enhancement of mechanical or process equipment. Knowledgeable operations personnel regularly take advantage of the many cost savings and performance improvements now available from these processes and materials; some of which were previously used only for aerospace applications.

BACKGROUND AND USES

Thermal spraying is a process which uses combustion, electric arc or gas plasma, combined with an inert feeder gas, to apply a wide variety of molten metals, ceramics, oxides, and carbides to a target substrate. Combining various substrates with particular coatings allows engineers to choose from using a coated component instead of a solid one.

Some of the major use categories for thermal spray coatings are to increase wear resistance, prevent corrosion, provide thermal barriers or electrical insulation, and restore parts to their original dimensions. In concert with each of these categories, advanced finishing techniques provide a broad spectrum of surface finishes ranging from 1 RMS to over 300 RMS to meet virtually any requirement.

Plasma Arc Spray

Plasma arc spraying is the workhorse of the thermal spray processes. The material to be sprayed is introduced in powder form in the plasma gas stream either in the torch nozzle or just outside the nozzle. The velocity of the plasma stream that exits the nozzle is about the velocity of sound in air. The velocity of spray is usually increased by constricting the torch nozzle. Argon and helium are popular plasma gases, and if these are properly used, the spray deposit will contain very little oxide. This is a process advantage over thermal spray processes that use air as gas to produce the consumable spray. The intense heat of the plasma does not produce substantial substrate heating. Most of the heat to the substrate comes from the heat from the impinging consumable droplets and substrate temperatures usually do not get over 250 degrees F. When substrate heating becomes a consideration, on for example thin wall tubes, auxiliary jets of inert gas are used for substrate cooling. Hundreds of powder consumables are available. They fall into four different categories: metals, ceramics (primarily oxides and carbides), cermets and composites. The most popular ceramic coatings are aluminum oxide and chromium oxide. They are used mostly for wear applications. Ceramics such as yttria-stabilized zirconia and magnesium zirconate are used for thermal barrier applications. The most popular cermet consumable used in plasma spraying is tungsten carbide/cobalt. The mechanical, physical, and chemical properties of a thermal spray deposit may be different from the properties of the same material in bulk. Plasma spraying has been so extensively used in critical components that there is significant data on the properties of many deposits. In general, the differences between spray and bulk properties are inconsequential.

CERAMIC AND METAL COATINGS

Thermal Combustion Spray

Thermal combustion jet spraying was first offered on a commercial basis in 1981. The consumable to be sprayed is introduced into the center of the jet stream from a powder feeder using a carrier that is compatible with the fuel gas mixture. Bond strength is the product of the particle velocity and temperature. The deposit densities are about 95% or better and porosity of the coating can be as little as 0.5%.

Thermal Combustion Wire Process

The materials that can be sprayed with the wire flame spray process include any material that can be made into flexible wire that will melt in the oxyacetylene flame. Many consumables are available, but the commonly sprayed materials are zinc and aluminum, and are used primarily for corrosion protection. The bronzes and hard steels are used for wear protection, and the soft steels and molybdenum are used as rebuilding material for repair jobs. There is no thickness limit to this process, and deposits as thick as 0.25: have been made. A common thickness for wire spray deposits is 0.030" to 0.050" for wear applications and rebuilding. For corrosion applications, deposits can be as thin as 0.001".

QUALITY ASSURANCE PROGRAM

JMS Southeast, Inc. employs one of the most rigorous Quality Assurance programs in the industry. Our specially formulated powders can be traced from the location where they are mined, through each refining process, to the finished product ready for use at our plant. Each coating application undergoes analysis by either the metallographic or petrographic laboratory prior to release. This assures our customers of receiving consistently reproducible coatings of the highest quality.

CUSTOMER SERVICE

Because we use state-of-the-art coating systems, waste is virtually eliminated and high coating speeds are attained. These factors allow us to offer the highest quality coatings at the most competitive prices available today.

INDUSTRIAL PRODUCTS

Almost any industry can benefit from JMS Southeast's coating experience and service. We have wells and other coated parts for the Textile Industry, Power Industry, Petrochemical Industry, Pulp and Paper, Steel Industry, Aluminum Plants, Glass Plants and Wire Drawing Industry just to name a few.

JMS also has the capabilities to teflon coat any thermowells, protection tubes or sensors as needed. Teflon coating will prolong the life of the sensor by protecting it from many forms of chemical attack.

Pleas contact JMS for prices on our many coatings services.

FREQUENTLY USED COATINGS

COATING DESIGNATION	NOMINAL CONSTITUENTS	COMMENTS
	PLASMA SPRAYS	
USSE-115-P	Molybdenum	Hardness, 350 DPH Bond Strength, 8300 psi
USSE-280-P	Cobalt-Chromium-Alumni-num-Yttrium (Co-Cr-Al-Y)	Bond strength 5000 psi
USSE-462-P	Tungsten-Carbide Chrome-Carbide Nickel	Hardness, 800 DPH Bond strength, 8700 psi Porosity, less than 3%
USSE-601-P	Aluminum Oxide	Hardness, 1100 DPH Bond strength, 7000 psi Porosity, less than 4%
USSE-660-P	Zirconium Dioxide-Yttria	Hardness, 260 DPH Bond varies between 2200 psi and 6300 psi
	THERMAL HVOF COMBUSTION SPRAYS	
USSE-205-M	Stellite 6-type Alloy	Hardness, 390 DPH Bond strength, 11,000 psi
USSE-230-M	Hastelloy-B-2 Type Alloy	Hardness, 315 DPH Bond strength, 10,000 psi
USSE-231-M	Hastelloy-C-276 Type Alloy	Hardness, 170 DPH Bond strength, 10,000 psi
USSE 282-M	Cobalt-Chrome-Aluminum-Yttrium (Co-Cr-Al-Y)	Hardness, 170 DPH Bond strength, 8000 psi
USSE-422-M	Cr3 C2-Ni Cr	Hardness, 870 DPH Porosity, less than 1% Bond strength, 10,000 psi
USSE-445-M	WC-9 Co	Hardness, 1220 DPH Porosity, less than 1% Bond strength 11,000 psi
USSE-475-M	Tungsten Carbide 10 Cobalt-4Chrome	Hardness, 390 DPH Bond strength, 11,000 psi
	WIRE TORCH	
USSE-118-W	Stellite 6-Type Alloy	Hardness, 390 DPH Bond strength, 4000 psi
USSE-206-W	Molybdenum	Hardness, 245 DPH Bond strength, 6000 psi
USSE-240-W	Monel-type composition	Hardness, 150 DPH Bond strength, 4300 psi
USSE-257-W	Nickel-Chrome	Hardness, 195 DPH Bond strength, 4000 psi

ADDITIONAL COATINGS

The following list includes an abbreviated list of additional coatings that are available. Although this list is not all inclusive, it does cover the majority of available coatings.

These lists of coating are for reference only. Please contact JMS's Engineering Department for application assistance. Our qualified staff will help you select the best coating for your application.

COATING DESIGNATION	NOMINAL CONSTITUENTS
PLASMA SPRAY	
USSE-120-P	Nickel

White	2190 & above	1200 & above

*Observations made in a relatively dark place with no eyeshades. Observations in lighter areas will tend to shift temperatures higher.

JMS COATINGS APPLICATION CHECKLIST

The information requested below is a minimum requirement to enable JMS to provide a suitable application solution, particularly in the case of exotic metal and/or elements.

Jacket	____
Coating	____

1. Maximum temperature sensor will be exposed to:_____
   Continuous _____ Intermittent _____
2. Normal operating temperature _____
3. Process conditions:
   a) Gas, liquid, etc. _____
      (Please provide chemical concentration where possible)
   b) Approximate flow rate _____
   c) Special pressure or vibration considerations _____
   d) Any abrasive conditions _____
4. Temperature element details - RTD or Thermocouple type, etc. (This information is also requested in cases where JMS has been asked to supply only the thermowell.)

Platinum RTD	_____	E Thermocouple	_____
J Thermocouple	_____	R,B,S,Thermocouple	_____
K Thermocouple	_____	Other	_____

5. If a metal other than listed in the JMS catalog is specified (ex. - nickel or black steel), we need to know the content or appropriate ASTM, UNS, AISI-SAE number. _____
6. Is thermal shock a possibility? _____ Is the temperature cycled frequently? _____
   Does the probe remain immersed? _____
7. If in gas environment, is it oxidizing, reducing, or inert? _____
8. If this is to be a replacement application, information regarding the successes/failures of other units could be beneficial. When possible, please provide any manufacturer and part number information.
9. Other Comments _____
   _____

SECTION 5

THERMAL PROCESSING / HEAT TREATING (ANNEALING)

If you wish to have your sensor annealed, you need to provide JMS with the correct time, temperature profiles.

All temperature treating processes start at room temperature.

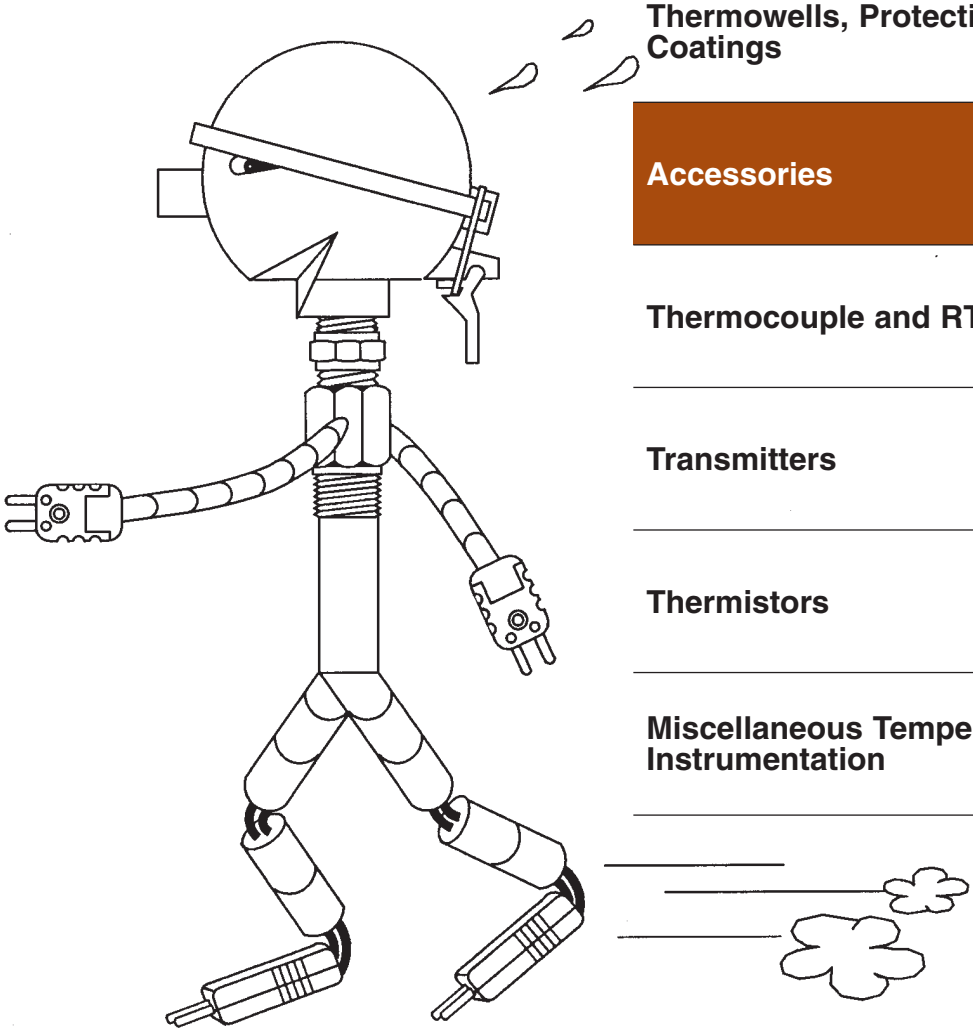
Select Atmosphere: inert, vacuum, or ambient air

Select Portion of sensor to be temperature treated: hot end only, entire sensor, or component of sensor prior to assembly

Stage #1 Increase / decrease temperature to _____° F / C at a rate of _____° F/ C per minute. (Or instant, or doesn't matter)

Stage # 2 Allow to set at that temperature for _____hours / minutes.

Stage # 3 Increase / decrease temperature to _____° F / C at a rate of _____° F / C per minute. (Or instant, or doesn't matter)



Note: If water or other liquid quenching is required, please describe.

Specify if parts should be cleaned (buffed) free of any accumulated tarnishing caused by this process.

PLUGS AND JACKS

Connector bodies are molded of glass filled thermoset compounds (will not melt) for high strength and dependability. The standard connectors will withstand ambient temperatures to 400°F continuous and 500°F intermittent. High temperature connectors will withstand ambient temperatures to 800°F continuous and 1000°F intermittent. Standard plugs are color coded per ANSI standards. High temperature plugs are color coded rust. High temperature connectors have nickel plated prongs; and therefore, are good for use in corrosive environments. Other high temperature plugs and jacks are made of ceramic material and can be color coded.

Alloys of prongs match ANSI calibrations to maintain sensing accuracy. Alloys and polarity are identified by symbols molded into the body.

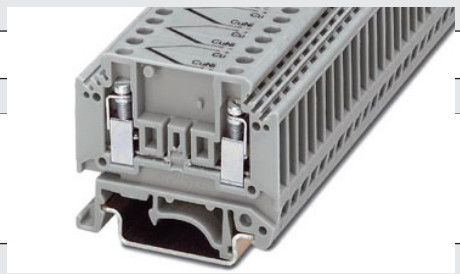
COMPENSATED DIN RAIL THERMOCOUPLE CONNECTIONS

In thermocouple circuits the wires of the thermocouple are connected to extension wires. This is exactly the application for thermocouple terminal blocks.

Extension wires are made of materials which have the same EMF characteristics as the thermocouple. These thermocouple terminal blocks are made up of materials matching the composition of the extension wires.



The thermocouple terminal block pair is clearly marked on the top with an indication of the material on the metal bars. The insulating housing is made of unbreakable polyamid 6.6 and has the universal footing for mounting on all EM/DIN rails. Temperature rated to 200° C. These blocks allow the terminals to be integrated in a panel mounting or other rail layout.

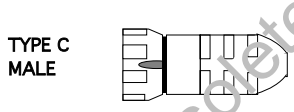
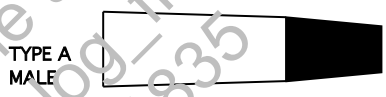
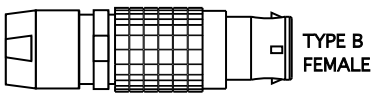
SECTION 6



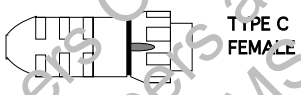
QUICK CONNECTORS



These self-latching quick connectors are designed to assure continuous and accurate temperature monitoring. Available for either thermocouples or RTD's, these connectors overcome the potential connector measurement errors unique to either method of temperature measurement.



In thermocouple circuits the wires of the thermocouple are connected to extension wires. The extension wires are made of materials which, up to 200 degrees C, have the same EMF characteristics as the corresponding thermocouple wire. By using connector pins of the same material as the extension wire the creation of a second thermocouple junction is avoided and the integrity of the signal is maintained.



Screwed connections in an RTD circuit offer a site for oxidation. This will cause an imbalanced bridge and will severely degrade the accuracy of the reading. The soldered connection used in these connectors eliminates this possibility.

SECTION 6

ROTARY SELECTOR SWITCHES

The JMS Deluxe Switch has an integral face plate and screw/solder terminals.
Terminals are silver plated brass numbered circuits with polarity identification.
Blades and contacts are silver plated with self-cleaning wiper action.
The “OFF” position has terminals available for shorting input circuit when using the switch with a digital meter.
Order numbers 63-2 through 63-10 are break before make.
Order numbers 63-12 through 65-40 and 6R-6 through 6R-36 are make before break.
“Break before make” indicates the previous circuit is broken before the next contact is made.
“Make before break” indicates the second contact is made before the first contact is broken.

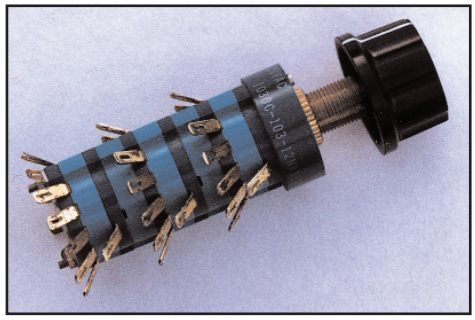
6R-24	24
6R-28	28
6R-32	32
6R-36	36



The JMS economy switch has an adhesive backed face plate for the panel. Terminals are gold plated brass numbered circuits. Contacts are the self-cleaning wiper action type. Standard switch is “break before make”, however, “make before break” can be supplied upon request.

JMS Southeast stocks both two pole and three pole twelve point economy switches.

NEMA TYPE ENCLOSURES

The following table is based on ANSI/UL 50-1989 and is reprinted with permission of Underwriters Laboratories, Inc.

NUMBER	INTENDED USE AND DESCRIPTION
1	Indoor use primarily to provide a degree of protection against contact with the enclosed equipment and against a limited amount of falling dirt.
2	Indoor use to provide a degree of protection against limited amounts of falling water and dirt.
3	Outdoor use to provide a degree of protection against wind-blown dust, rain, and sleet; undamaged by the formation of ice on the enclosure.
3R	Outdoor use to provide a degree of protection against falling rain and sleet; undamaged by the formation of ice on the enclosure.
3S	Outdoor use to provide a degree of protection against windblown dust, rain, and sleet; external mechanisms remain operable while ice laden.
4	Indoor or outdoor use to provide a degree of protection against splashing water, wind blown dust and rain, and hose-directed water; undamaged by the formation of ice on the enclosure.
4X	Indoor or outdoor use to provide a degree of protection against splashing water, wind blown dust and rain, and hose-directed water; undamaged by the formation of ice on the enclosure; resists corrosion.
6	Indoor or outdoor use to provide a degree of protection against the entry of water during temporary submersion at a limited depth; undamaged by the formation of ice on the enclosure.
6P	Indoor or outdoor use to provide a degree of protection against the entry of water during prolonged submersion at a limited depth.
11	Indoor use to provide by oil immersion a degree of protection of the enclosed equipment against the corrosive effects of corrosive liquids and gases.
12,12K	Indoor use to provide by oil immersion a degree of protection against dust, falling dirt, and dripping noncorrosive liquids.
13	Indoor use to provide by oil immersion a degree of protection against dust and spraying of water, oil, and noncorrosive coolants.

HAZARDOUS (CLASSIFIED) LOCATIONS

There are definitions essential to understanding the use of Thermocouples and RTDs in hazardous (classified) locations.

Encapsulation: An international term describing a type of protection in which the parts could ignite an explosive atmosphere by either sparking or heating are enclosed in an encapsulant in such a way that this explosive atmosphere cannot be ignited. This type of protection is referred to by CENELEC as "Ex m" in draft Standard EN50028.

Explosion Proof Enclosure: An enclosure that is capable of withstanding an explosion of a gas or vapor within it and of preventing the ignition of an explosive gas or vapor that may surround it and that operates at such an external temperature that a surrounding explosive gas or vapor will not be ignited thereby. This type of enclosure is similar to a flameproof enclosure.

Explosion Proof Equipment (Apparatus): Equipment or apparatus enclosed in an explosion proof enclosure.

Explosion Proof Seal / Cable: A cable terminator filled with compound and designed to contain an explosion in the enclosure to which it is attached or to minimize passage of flammable gases or vapors from one location or another. A conduit seal may also be used as a cable seal. This method differs from the international method which requires cable glands.

Hermetically Sealed Device: A device that is sealed against the entrance of an external atmosphere and in which the seal is made by fusion. Continuous soldering, brazing, welding and the fusion of glass to metal are examples of recognized methods.

Nonincendive Circuit: AA circuit in which any arc or thermal effect produced in normal operating conditions of the equipment is not capable, under prescribed conditions, of igniting the specified inflammable gas, vapor-in-air mixture, combustible dusts, or ignitible fibers or flyings.

Nonincendive Equipment: Equipment having electrical/electronic circuitry and components that are incapable under normal conditions, of causing ignition of a specified flammable gas or vapor-in-air mixture due to arcing or thermal effect. This type of protection is referred to by IEC as "Ex n." Ex n protection is limited to gas and vapor hazards.

Simple Apparatus (as applied to intrinsic safety): A device that will not generate nor store more than 1.2V., 100mA, 25mW, or 20μJ. Examples are switches, thermocouples, light-emitting diodes, and resistance temperature devices.

At the publication of this catalog, JMS has submitted complete sensor assemblies to FM for testing and approval as meeting all the requirements for Class I, Division II suitability. The approval designs are readily available by drawing and can be ordered thru your salesperson by drawing number 11400.

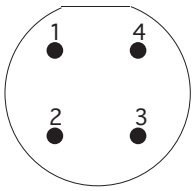
It should be noted that a hermetically sealed, incapsulated, simple apparatus with explosion proof seals containing nonincendive circuits rates as a nonincendive piece of equipment. Therefore, thermocouples and RTDs so built require no external marking at all. However, the CYA principle might dictate such markings and they are offered by JMS.

(1) Group D equipment shall be permitted for this atmosphere if such equipment is isolated in accordance with Section 501-5(a) of National Electric Code by sealing all conduits 1/2 inch size or larger.

(2) Group C equipment shall be permitted for this atmosphere if such equipment is isolated in accordance with Section 501 -5(a) of National Electric Code by sealing all conduits 1/2 inch size or larger.

(3) For classification of areas involving ammonia atmosphere, see Safety Code for Mechanical Refrigeration (ANSI/ASHRAE 15-1978) and safety requirements for the Storage and Handling of Anhydrous Ammonia (ANSI/CGA G2.1-1972).

(4) A saturated hydrocarbon mixture boiling in the range 20-135 degree C. (68 - 275 degrees F.) Also known by the synonyms benzine, ligroin, petroleum ether, or naphtha.



Compliances:
JMS explosion proof products are designed to fulfill the applicable Underwriter's Laboratories and Canadian standards requirements and National Electrical Code Article 500 Hazardous (Classified) Location installations. Where statement of compliances is used in this catalog in reference to UL, CSA, or FM listed standards numbers, it is for identification of products shown in catalog having met design criteria and company tested.

(The statement of compliances does not imply that the products have been approved by Underwriters' Laboratories, Canadian Standards Association or Factory Mutual). Such approvals are covered by listing published by Underwriters' Laboratories, Canadian Standards Association and Factory Mutual and are available upon request.

MULTI-CONDUCTOR EXTENSION CABLE

Each conductor is insulated with polyvinyl chloride or teflon. An aluminum backed *Mylar tape serves as an electrostatic shield. A solid 20 gauge tinned-copper drain wire is over the bundle in direct contact with the aluminum/mylar shield, thus minimizing any stray EMF's.

Conductors are color coded and numbered for identification. All conductors are insulated with an outer jacket of polyvinyl chloride or teflon insulation approximately .0245" thick.

Multipair extension cable can be manufactured with various quantities of pairs and insulation types. Contact JMS Southeast sales office for any requirements you may have.

*Mylar is a trademark of DuPont Company.

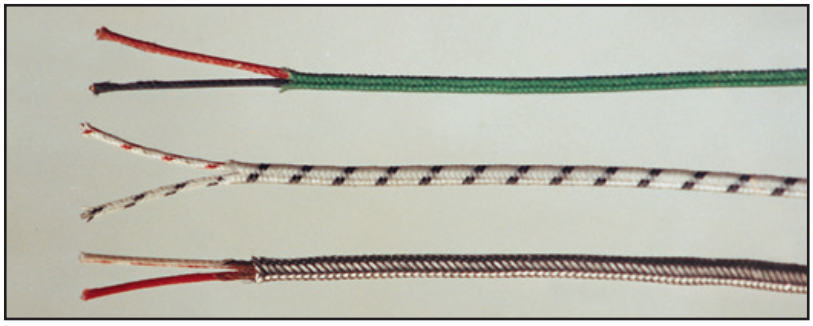
WIRE INSULATION MATERIAL

WIRE INSULATION MATERIAL

TEFLON INSULATED WIRE



Teflon (extruded) Teflon (extruded) - TT

Color-coded teflon (FEP)* is extruded on the positive and negative conductors and outer jacket. This insulation is unaffected by most corrosive substances, outdoor weather, or lubricants. It is flame resistant and heat aging will not cause embrittlement or cracking. Excellent for cryogenic applications. Offered in thermocouple grade. Temperature rating: Continuous: Up to 400°F and 200°C.

Teflon (Fused TFE Tape) Teflon (Fused TFE Tape) TF

TFE tape is spirally applied to the conductor and heated. This process fuses the tape into a homogeneous layer of TFE. Fused teflon wire offers good abrasion resistance and excellent resistance to both moisture and chemicals. Offered in thermocouple grade. Temperature rating: Continuous: Up to 500°F and 260°C.

*DuPont Trademark

FIBROUS INSULATED WIRE

Fiberglass Braid-GG

Glass braid on individual conductors with glass braid outer jacket. Designed for continuous use in high temperature applications. Poor abrasion and moisture resistance. Offered in thermocouple grade. Temperature rating: Continuous: Up to 900°F and 482°C. Intermittent: Up to 1000°F and 529°C.

Hightemp Fiberglass Braid-HG

A high temperature fiberglass braid is applied over each conductor and then impregnated with a binder. Although the binder improves resistance to abrasion and moisture, it is destroyed above 400°F (204°C). Offered in thermocouple grade. Temperature rating: Continuous: Up to 1300°F and 705°C. Intermittent: Up to 1600°F and 871°C.
We recommend SS overbraid with this wire.

Fiberglass Braid with Stainless Steel Overbraid-GS and HS

A stainless steel overbraid is applied to fiberglass wire to increase the wires resistance to abrasion, mechanical and physical damage. It may be applied to 14 through 30 gauge conductors.

Refrasil-RR

Vitreous silica is applied on both positive and negative conductors with a vitreous silica outer jacket. Refrasil is not color coded. Used in high temperature applications. Moisture and abrasion resistance only fair. Offered in thermocouple grade. Temperature rating: Continuous: Up to 1600°F and 871°C. Intermittent: Up to 1800°F and 982°C. We recommend SS overbraid with this wire.

Nextel-NE

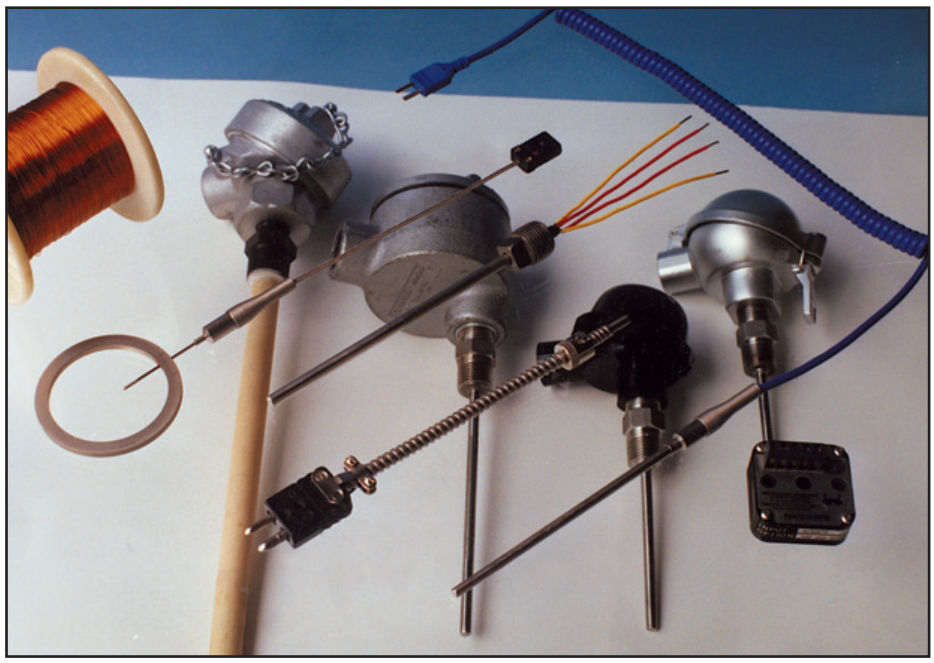
A high temperature ceramic fiber is applied over each conductor and then overall. Nextel is not colored coded. Although nextel is not recommended for use with platinum thermocouples, it can be used as an excellent option for other high temperature applications. Its use is limited by the temperature rating of the thermocouple wire it insulates. It is frequently used in furnace and traveling thermocouple applications. Temperature rating: Continuous: Up to 2200°F. Trademark of Sumitomo Corporation. We recommend SS overbraid with this wire.

NOISE IN THERMOCOUPLE CIRCUITS

The reduction of electrical noise pickup by instrument circuits is an important consideration in temperature measurement. Noise obscures small changes in signal level. Electrical noise comes in the form of static, magnetic, common mode and crosstalk.

Static noise is capacitively coupled to the wires in an instrument circuit from power lines or other voltage sources. This type of noise can be reduced or eliminated by the use of a shield placed around the wires.

Magnetic noise occurs when a current goes through a conductor. This can occur around power lines, relays, motors, generators, etc. Twisting the extension wire can minimize this noise, by canceling out these magnetic currents.



Common Mode noise is dependent upon the electrical connections in the instrument circuit and occurs when different locations in a plant are at different ground potentials. This type of noise is especially detrimental to grounded thermocouples. If the thermocouple is electrically grounded at the measuring point and if the instrument is also grounded, a current will flow between the thermocouple and instrument, which are at different electrical potentials. To combat this problem many instrument manufacturers have neither of their input terminals grounded, incurring a high common mode rejection rating of the system. Another type of common mode noise is created through capacitance which exists between the thermocouple conductors and any metal object near it. The metal objects, being at a different potential than the thermocouple tip, allows currents to flow into the conductors causing a voltage drop along the conductors. This drop adds to the EMF signal and produces noise. The best way to combat this noise problem is to shield the extension wire from the thermocouple to the control instrumentation. The shield is at the same potential for this entire length. The only ground connection in the shield should be at the thermocouple.

Finally, cross talk noise occurs when signals in adjacent pairs of wires transfer to each other. The most common method to eliminate this noise problem in multipair cable is to individually shield each pair of wires and ground each shield individually.

JMS Southeast, Inc., can provide you with shielded and nonshielded thermocouple extension wire ranging from a single pair to 36 pair cable.

Please contact us for any thermocouple wire needs you may have.

Note: When using shielded wire with your sensor, we attach the shield to the tube or sheath with which the sensor is built. The drain wire is bare and left accessible to the end user. If you do not want the shield electrically connected to the sheath or tube, please specify a “Floating Shield” and we will accommodate you. (Normally the drain wire on grounded/shielded thermocouples is left unconnected at the instrument to avoid ground loops.)

THERMOCOUPLE TYPE INFORMATION

JMS offers thermocouples and wire in the following types. Listed below are suggested criteria to consider in selecting the desired type for your application. Contact JMS Southeast if additional information is required.

(J)–Iron vs Constantan
May be used in vacuum, oxidizing, reducing, and inert atmospheres. Heavier gauge wire is recommended for long term life above 1000°F since the iron element oxidizes rapidly at these temperatures.

(T)–Copper vs Constantan
May be used in vacuum, oxidizing, reducing, and inert atmospheres. It is resistant to corrosion in most atmospheres. High stability at sub-zero temperatures and its limits of error are guaranteed at cryogenic temperatures.

(K)–Chromel vs Alumel
Recommended for continuous use in oxidizing or inert atmospheres up to 2300°F (1260°C), especially above 1000°F. Cycling above and below 1800°F (1000°C), is not recommended due to EMF alteration from hysteresis effects. Should not be used in sulfurous or alternating reducing and oxidizing atmospheres unless protected with protection tubes. Fairly reliable and accurate at high temperatures.

(E)–Chromel vs Constantan
May be used in oxidizing or inert atmospheres, but not recommended for alternating oxidizing or inert atmospheres. Not subject to corrosion under most atmospheric conditions. Has the highest EMF produced per degree than any other standard thermocouple and must be protected from sulfurous atmospheres.

(S,R)–Platinum vs Platinum Rhodium
Recommended for use in oxidizing or inert atmospheres. Should not be used in reducing atmospheres, or in contact with any metallic protection tube. Continuous use at very high temperatures may cause excessive grain growth and drifts in calibration.

(N)–Nicrosil vs Nisil
May be used in oxidizing, dry reducing, or inert atmospheres. Must be protected in sulfurous atmospheres. Very reliable and accurate at high temperatures. Can replace Type K thermocouples in many applications.

(W)–Tungsten vs Rhenium
Recommended for use in vacuum, high purity hydrogen, or pure inert atmospheres. May be used at very high temperatures (2316°C). This wire is inherently brittle.

THERMOCOUPLE GRADE VS EXTENSION GRADE WIRE

Thermocouple wire or extension grade wire is recommended to connect thermocouples to the control instrumentation. The thermocouple wire insulation depends upon the environment in which it exists. The calibration of the wire must correlate to the thermocouple calibration. Other considerations in choosing thermocouple extension grade or thermocouple grade wire are temperature range, service, life, and location (conduit, moist atmosphere, etc.).

Thermocouple extension wire should not be used to manufacture a thermocouple, but to transmit the signal from the thermocouple to the instrumentation. An extension grade thermocouple may not be within ANSI standard limits or error.

Thermocouple grade wire can be used to connect the thermocouple to the instrumentation. It is slightly more expensive than the extension grade wire and it is not usually the most economical option for long runs.

ACCURACY OF JMS THERMOCOUPLE WIRE

JMS insulated and bare thermocouple wire is matched to meet standard or special limits of error for temperatures above 32°F (0°C), as given in ANSI MC 96.1 and shown in tables below.

LIMITS OF ERROR FOR THERMOCOUPLE WIRE

THERMOCOUPLE TYPE		°F.

ACCURACY OF JMS EXTENSION WIRE

Thermocouple extension wire has approximately the same thermoelectric characteristics as thermocouple wire, but its accuracy is guaranteed over a more limited range of temperatures. Thermocouple extension wire can offer advantages in cost when used for connections between thermocouples and instruments. For base metal types of thermocouples, extension wire is of substantially the same composition as the corresponding thermocouple type. For noble metal types, however, an entirely different alloy is formulated to match the noble metal characteristics over a specified temperature range. This is necessary due to the high cost of the noble metals which would otherwise be necessary for the interconnection. The "X" in the ordering codes denotes extension grade wire.

NON-ISOLATED TRANSMITTERS

JMS non-isolated transmitters can be mounted in the following JMS heads; 6L-General purpose aluminum head with hinged cover and 6I-Explosion proof head. See appropriate sensor section for complete assembly information.

JMS Southeast carries non-standard transmitters. Contact JMS for options other than those listed for the standard transmitters or for any additional information.

#1	SERIES [12, 13]
8N	Transmitter, Non-Isolated

#2	INPUT
*J	Iron/Constantan thermocouple

ISOLATED TRANSMITTERS

These transmitters can be mounted in the JMS explosion proof head. See appropriate sensor section for complete assembly information. Input to output isolation eliminates ground loop errors and permits direct transmission of a signal to a receiver where common mode voltages up to 3700 volts RMS may exist.

JMS Southeast also carries non-standard transmitters. Options other than those listed are available. Contact JMS for information.

#1	SERIES [14, 15, 16, 17]

or call JMS directly at 1-800-873-1835
for fast and friendly assistance.

The 888 series specified with these ordering symbols include a temperature sensor assembly with an integral transmitter and indicator.

The assemblies are 316 stainless steel and 1/4" outside diameter. Thermocouples have ungrounded junctions. RTD's have a 3 wire configuration and a 0.00385 alpha. The most popular assembly features a spring-loaded fitting with a thermowell. Although other thermowells are available, the standard well is 316 stainless steel, .260 Bore.

For assemblies other than those listed please consult the appropriate sensor section or contact JMS Southeast.

SECTION 8

The NEW Dual Display CAL 9500

Temperature Controller

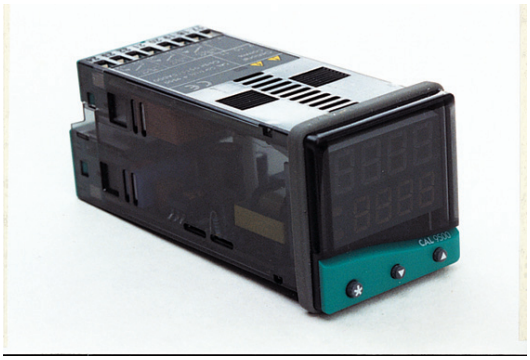
With 4-20 mA Retransmission

Dual-display 1/16 DIN Autotune Temperature Controller with Windows™ based Charting and logging

Introducing the most versatile CAL controller of them all, featuring permanent displays of both process and setpoint temperature, together with triple outputs inviting a choice from different combinations of 4-20 mA, relay and SSR driver devices.

In addition, the CALCOMMS™ software package is designed for PC supervision of up to 32 Model 9500 controllers. It is affordable, easy to use and is an ideal way of providing temperature records for management requirements.

CAL 9500



- **Dual four digit display**
- **Full PID Autotune**
- **Ramp / Soak**
- **5 Alarm configurations**
- **PID Heat-Cool**
- **Sleeve mounting**
- **3 year warranty**

CALCOMMS™

- **WindowsTM based logging and charting software**
- **Instrument configuration and remote setpoint adjustments**
- **Recipe / profile save and recall**
- **Instrument cloning**
- **Selectable scan rate**
- **Alarms**

CAL 9500

Thermocouples

9 types	B,E,J,K,L,N,R,S,T
Standards:	IPTS68/DIN 43710
External resistance	100 Ω Maximum
CJC rejection	20:1 (0.05° / °C) typical

Resistance temperature detectors (RTD)

RTD-2/Pt 100 2 wire	
Standards:	DIN 43760 (100Ω 0°C/138.5Ω 100°C Pt)
Bulb current:	0.2mA maximum

Linear process inputs

mV range:	0 to 50mV (0to 20mV, 4 to 20mV)

Applicable to all inputs SM = sensor maximum

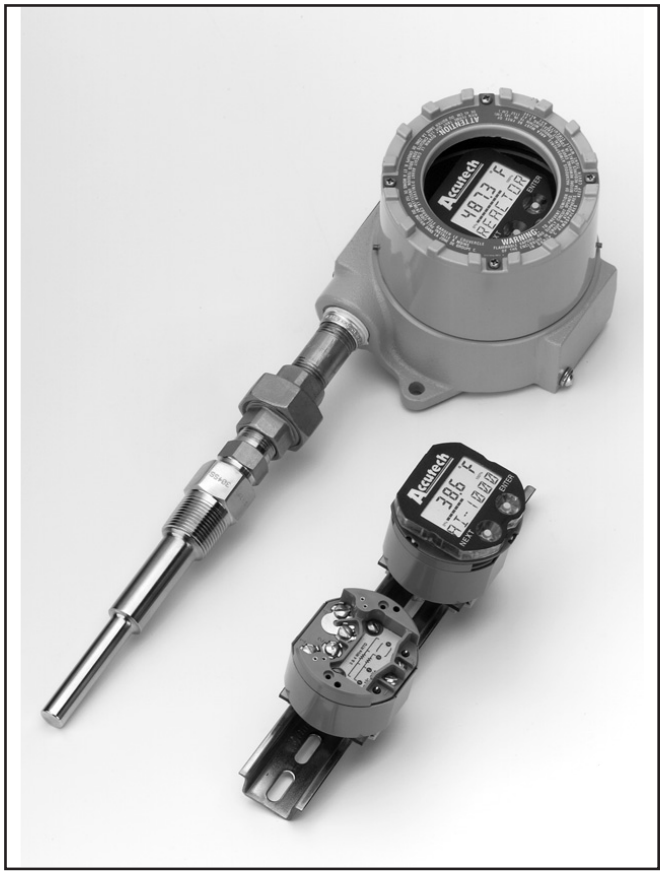
Calibration accuracy	±0.25% SM ± 1°C
Sampling frequency:	input 10Hz, CJC 2 sec.
Common mode rejection:	Negligible effect up to 140dB, 240V, 50-60Hz
Series mode rejection:	60dB, 50-60Hz
Temperature coefficient:	150ppm/°C SM
Reference conditions:	22°C±2°C, rated voltage after 15 minutes setting time

Output devices

SSd/SSd1/SSd2:	solid state relay driver: To switch a remote SSR 5Vdc +0/-15% 15mA non-isolated
Miniature power relay:	form A/SPST contacts (AgCdO)
r-LY and rLY1:	2A/250ac resistive load
r-LY2:	1A/250ac resistive load

General

Displays:	Upper, 4 Digits high brightness green LED. 10mm (0.4") high. Lower, 4 Digits high brightness orange LED. 9mm (0.35") high Digital range - 199 to 9999 Hi-res mode - 199.9 to 999.9
	LED output indicators - flashing SP1 square-green; SP2 round-red
Keypad:	3 full travel elastomeric push buttons



Environmental

Humidity:	Max 80%
Altitude:	up tp 2000m
Installation:	Categories II and III
Pollution:	Degree II
Protection:	NEMA 4X, IP66
EMC emission:	EN50081-1 FCC Rules 15 subpart J Class A
EMC immunity:	EN50082-2
Ambient:	0-50°C (32-130°F)
Mouldings:	Flame retardant polycarbonate

Mechanical:

	Front facia 51.0 x 51.0mm (includes gasket) Sleeve length 106.7mm (with gasket fitted) Instrument 44.8 x 44.8mm (1/16th DIN) Overall length 116.2mm
Weight:	130g (4.2oz)

Model AI-1000 Revision 2 Programmable Temperature Transmitter

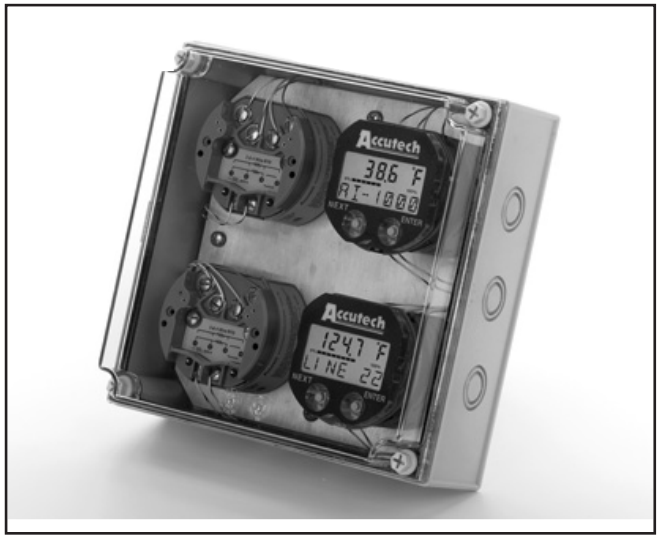
The **AI-1000 R2** Programmable Temperature Transmitter combines the best features from smart and analog designs. It's fast, easy-to-use and competitively priced – like an analog transmitter. The AI-1000 R2 is microprocessor-based, highly accurate and accepts a wide variety of inputs – like a smart transmitter. Configure this transmitter with its optional plug-in display or with a PC using the windows-based Accutech Transmitter Manager software. The AI-1000 R2 accepts a wide variety of thermocouples and 2-, 3- and true 4-wire RTD measurements. Span the transmitter anywhere within the sensor's usable range – with no minimum span. Mount the AI-1000 R2 wherever you need it – head mount, yoke mount, panel or wall mount. Its versatility and compact design allow for one transmitter to fit all your needs.

Model AI-1500 HART®, Smart Temperature Transmitter

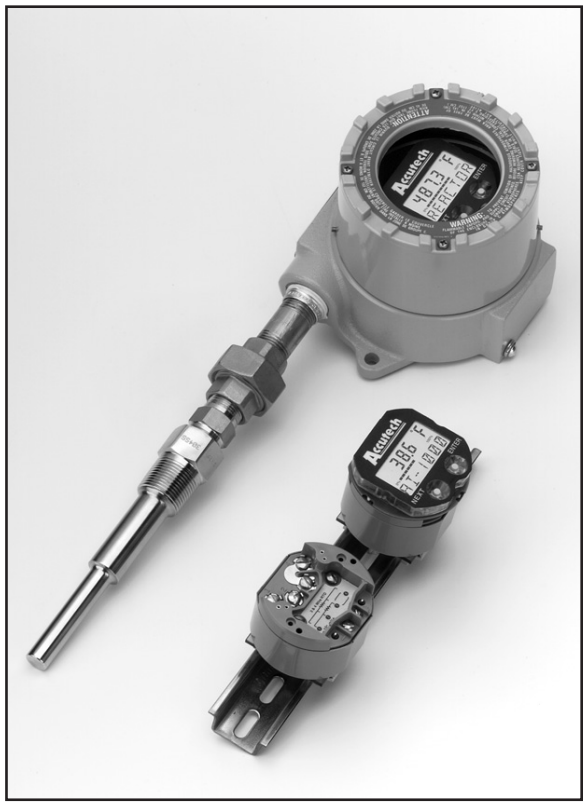
The **AI-1500** HART® Smart Temperature Transmitter offers superior performance and unmatched versatility in smart transmitter designs. Automatic self-calibration, digital ambient temperature compensation and fast update speeds put the AI-1500 ahead of the competition. Configure this smart transmitter with its optional plug-in display, an HC275 HART® Communicator or a PC using the windows-based Accutech Transmitter Manager software. Head, yoke, panel or wall mount the AI-1500 to suit any application. The AI-1500 is simply the best transmitter available in its class.

AI-1000 TEMPERATURE TRANSMITTER

Model
AI-1000 Revision 2
Programmable Temperature Transmitter



Highlights

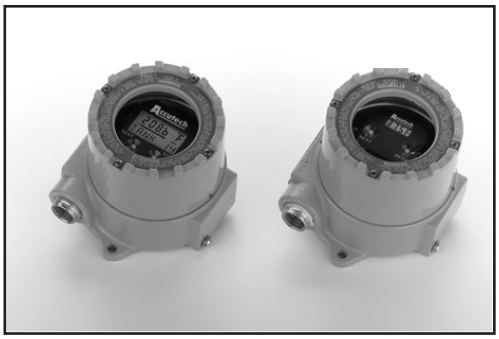


- **Exceptional Speed and Accuracy**
- **Guaranteed Measurement Stability**
- **Automatic Self-Calibration**
- **Automatic Cold-Junction Compensation**
- **Digital Ambient Temperature Compensation**
- **Accepts virtually any Thermocouple or RTD**
- **Set-up is fast and easy, no hand-held required**
- **Display Mode or PC Configuration**
- **Competitive Pricing**
- **Total Installation Flexibility**

The Accutech AI-1000 Revision 2 Programmable Temperature Transmitter combines the best features of analog and smart designs. It's fast, accurate, versatile and easy-to-use. It will give substantial benefits in a wide range of process industry applications.

Exceptional Capabilities
Capabilities that were once available only in high-priced "Smart" transmitters are now available in the compact, competitively priced AI-1000 R2.

Exceptional Long-term Stability
Accutech pioneered technology for automatic self-calibration. This capability is now available in a compact field transmitter. Automatic self-calibration to on-board reference standards increases measurement reliability and significantly reduces maintenance costs. The digital ambient temperature compensation virtually eliminates ambient temperature drift.



The AI-1000 R2 measurement stability exceeds all transmitters in its price class.

Tremendous Versatility
A single AI-1000 R2 transmitter will take virtually any thermocouple, RTD, millivolt or ohm input. It will give you linearized output over any part of the sensor range. The AI-1000 R2 allows you to dramatically reduce inventory and spare parts. You can configure it exactly the way you want. You can even re-configure the transmitter as your needs change! You do not need to stock two transmitter types, one for field mounting and one for panel mounting. One AI-1000 R2 will do it all.

Optional Plug-In Display and Set-Up Tool
The unique, time and cost-saving display options allow you to program and read any AI-1000 R2. No hand-held terminal is required. If you do not need the local read-out, you can unplug the display once you have completed the set-up. You can take it with you!

AI-1000 SPECIFICATIONS

AI-1000 Revision 2 Specifications

Thermocouple Sensors:

NIST Types B, C, E, J, K, N, R, S, & T; DIN Types L & U

RTD Resistance Sensors:

100Ω	Pt DIN curve (α=0.00385)	2, 3 or 4 wire
100Ω	Pt SAMA RC21-4 curve (α=0.003923)	2, 3 or 4 wire
100Ω	Ni DIN curve*	2, 3 or 4 wire
120Ω	Ni MINCO curve*	2, 3 or 4 wire
10Ω	Cu Curve CR228/229*	2, 3 or 4 wire

* PC Configuration

Millivolt Input Range: -15 to +115 mV DC

Thermocouple and RTD Linearization: Linear output with temperature conforms to NIST and DIN curves within ±0.05 °C.

Custom Linearization: Programmable, up to 22 points.*
* PC Configuration

Output: Two wire, 4-20mA

Output Ranging Adjustments:

Analog Zero: 100% of sensor range – Non-interacting
Analog Full-scale: Normal or Reverse acting

Minimum Output Span: None.

Output Resolution: 3.6μA

Transmitter Accuracy: Includes transmitter repeatability and hysteresis effects, rated under reference conditions of 24 °C with a supply voltage of 30 VDC.

Digital Accuracy: ±0.025% of the millivolt or ohm equivalent input reading, or the accuracy from the EGU Equivalent Table, whichever is greater. For thermocouples, add ±0.5 °C for cold junction measurement effect.

D/A Conversion: ±0.06% of the output span.

Analog Accuracy: Sum of the Digital and the D/A conversion errors.

Repeatability: Half of the digital accuracy value.

EGU Equivalent Table

T/C Types	Accuracy	RTD Sensors	Accuracy
B	±0.6 °C	100Ω Pt	±0.08 °C
C, R, S	±0.5 °C	100Ω Ni	±0.08 °C
E,J, K, N	±0.2 °C	120Ω Ni	±0.08 °C
L	±0.4 °C	10Ω Cu	±0.6 °C
T (> -150 °C)	±0.3 °C		
U (> -100 °C)	±0.4 °C		
Millivolt input	±0.006 mV	Ohm input	±0.002 Ω

Dynamic Response:

Start-up Time: 7 seconds.

Ambient Temperature Gradient: Automatic Compensation to 20 °C per hour change.

Update Time: 0.15 second.

Response to Step Input: 0.25 second, minimum; 1 second, typical.

Cold Junction Compensation: Self-correcting to ±0.5 °C

Ambient Operating Temperature: -40 to 85 °C (-40 to 185 °F)

Ambient Storage Temperature: -40 to 85 °C (-40 to 185 °F)

Ambient Temperature Stability: Self-correcting over the operating temperature.

Long Term Stability: Less than 0.05% of reading plus ±3.6μA per year.

Automatic Diagnostics: Every 3 seconds, self-checks for zero, span, cold junction temperature, sensor and transmitter malfunction.

Failsafe: User selectable; 3.6mA, 23mA, or OFF.

Interchangeability: All units interchangeable without field calibration.

EMI / RFI Immunity:

Operating Conditions: Industrial Environment
Immunity According to: EN 50082-1[1]
IEC 100-4-3 30 V/m 80-1000MHz
Emission According to: EN 55011, Group 1, Class A
EN 50081-2

Isolation: 500 VAC

Common Mode Rejection: 120 dB

Reverse Polarity Protection: 42 VDC applied with either polarity.

Power and Load:

Supply Voltage (no load): 12 to 42 VDC (30 VDC for I.S.)
Supply Voltage (with load): V_{Supply} = (12) + (R_{Load} in KΩ) x (23mA)
Supply Voltage Effect: Less than ±0.005% of Span/Volt.

Approvals: FM/CSA Non-Incendive rating. Intrinsic Safety optional.

Dimensions: Diameter: 2.35"
Height: 1.55" (with DK-1 or DK-2: 1.95")

Weight: 6 oz. (Electronics module only)

Standard Configuration: Type J T/C input. Analog output, 40 to 200 °F. HI failsafes. Configuration parameters may be field programmed via Display Mode with optional DK-1 or DK-2 Display / Keyboards or with a PC using an LSK Modem and Accutech Transmitter Manager Software. See Price List.

Options: Displays, Enclosures, Sensors, and Thermowells available from Accutech. See Price List.

Specifications subject to change without notice.

AI-1500 TEMPERATURE TRANSMITTER

Model AI-1500 HART®, Smart Temperature Transmitter

The Accutech AI-1500 Smart Temperature Transmitter is unique. It's easy to use and moderately priced - like an analog transmitter. It's also versatile, linear, and based on microprocessor logic.

The exceptional versatility of the AI-1500 not only lets you configure your transmitters exactly the way you want them; it also dramatically reduces back-up stock and spare parts. The AI-1500 is fully HART®, compliant and can be used with any HART®, compliant device (such as the HC275 HART®, Communicator).

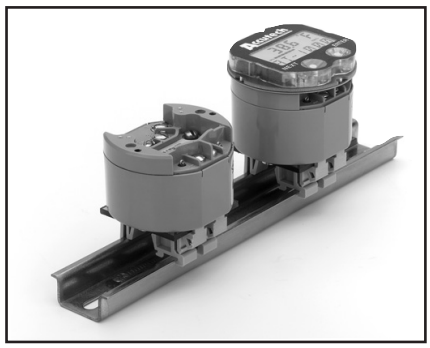
Superior Performance

- **Exceptional Speed and Accuracy**
- **Guaranteed Measurement Stability**
- **Automatic Self-Calibration**
- **Automatic Cold-Junction Compensation**
- **Digital Ambient Temperature Compensation**

Unmatched Versatility

- **Accepts virtually any Thermocouple or RTD**
- **Fully HART® Compliant**
- **Suitable for Field or Panel Mounting**

Simple Operation



- **Fast and Easy Set-up**
  - **– Use Hand-held, Display, or PC**
- **Optional Plug-In LCD Displays**

The AI-1500 can be mounted in explosion proof and weatherproof enclosures, as well as on a DIN rail for panel mounting applications. Local indication can be added at any time by simply plugging in one of the two optional displays. One transmitter on the shelf can back up the needs of an entire facility.

Automatic self-calibration every three seconds to on-board reference standards increases process measurement reliability and significantly reduces ongoing maintenance costs. Digital ambient temperature compensation completely characterizes each transmitter for performance in ambient environments from -40 to +185 °F, resulting in greatly reduced measurement drift.

In direct comparisons, the AI-1500 offers dramatically improved performance and outstanding value over competitive analog, programmable, and smart transmitters. Its stability, accuracy, versatility, reliability, and ease-of-use yield real benefits in process industry applications.

For over ten years, we have had a single focus - building the finest microprocessor-based industrial process instrumentation. This dedication to and knowledge of the industrial environment is built into every Accutech product. As a result, the AI-1500 is not only the best temperature transmitter available, the price and delivery are unmatched.

AI-1500 SPECIFICATIONS

SENSOR INPUT	RANGE, °F	ACCURACY	RANGE,°C	ACCURACY
Thermocouple Type B	+ 109 to + 3,308 °F	± 0.99 °F	+ 43 to + 1,820 °C	± 0.55 °C
Thermocouple Type C	+ 32 to + 4,208 °F	± 0.72 °F	0 to + 2,320 °C	± 0.40 °C
Thermocouple Type E	- 454 to + 1,832 °F	± 0.18 °F	- 270 to + 1,000 °C	± 0.10 °C
Thermocouple Type J	- 346 to + 2,129 °F	± 0.27 °F	- 210 to + 1,200 °C	± 0.15 °C
Thermocouple Type K	- 454 to + 2,502 °F	± 0.27 °F	- 270 to + 1,372 °C	± 0.15 °C
Thermocouple Type L	- 328 to + 1,652 °F	± 0.27 °F	- 200 to + 900 °C	± 0.15 °C
Thermocouple Type N	- 454 to + 2,372 °F	± 0.36 °F	- 270 to + 1,300 °C	± 0.20 °C
Thermocouple Type R	- 58 to + 3,214 °F	± 0.81 °F	- 50 to + 1,768 °C	± 0.45 °C
Thermocouple Type S	- 58 to + 3,214 °F	± 0.90 °F	- 50 to + 1,768 °C	± 0.50 °C
Thermocouple Type T	- 454 to + 752 °F	± 0.18 °F	- 270 to + 400 °C	± 0.10 °C
Thermocouple Type U	- 328 to + 1,112 °F	± 0.18 °F	- 200 to + 600 °C	± 0.10 °C
100Ω Platinum RTD DIN Curve (α = 0.00385)	- 328 to + 1,562 °F	± 0.09 °F	- 200 to + 850 °C	± 0.05 °C
100Ω Platinum RTD SAMA Curve (α = 0.003923)	- 328 to + 1,202 °F	± 0.09 °F	- 200 to + 650 °C	± 0.05 °C
Call Factory for 100Ω Ni, 120Ω Ni, and 10Ω Cu				
Millivolt	- 15 to 115mV	± 0.006 mV		
Ohm	0 to 500 Ω	± 0.002 Ω		

TRANSMITTER ACCURACY: ± 0.01% of the millivolt or ohm equivalent input reading, or the value from the Accuracy Table, whichever is greater; plus ±0.04% of the span. For thermocouples, add ±0.5°C (0.9∞F) for cold junction effect.
Accuracy includes transmitter repeatability, hysteresis and linearity as well as A/D conversion error, analog output error, line voltage effects, humidity effect under non-condensing conditions, vibration effect to 2g's & 500Hz.

TRANSMITTER AMBIENT TEMPERATURE EFFECT:
One-half the transmitter accuracy per 28°C (50°F)

TRANSMITTER REPEATABILITY: One-half the transmitter accuracy.

COLD-JUNCTION COMPENSATION: Digital self-correcting over the ambient temperature range to ±0.5°C.

LINEARIZATION: Thermocouple and RTD linearization to ±0.05°C. Custom linearization with 22 point curve via HART® Communications.

OUTPUT: Analog, Two wire 4 to 20mA.
Digital, HART, simultaneous communication

OUTPUT RANGING ADJUSTMENTS:
Analog Zero: 100% of Sensor range – Noninteracting
Analog Full-scale: Normal or Reverse Acting

LONG TERM STABILITY: Stability deviation per year is less than: (0.04% of output the span + 0.05% of the millivolt or ohm equivalent reading)

OPERATING TEMPERATURE RANGE:
-40°C to +85°C -40°F to + 185°F Electronics
-20°C to +70°C - 4°F to + 158°F Display (Full Visibility)
-40°C to +85°C -40°F to + 185°F Display (With reduced visibility)

STORAGE TEMPERATURE RANGE: -50°C to +85°C; -58°F to +185°F

DAMPING: User selectable time constant (63%) from 0 to 32 sec.

FAILSAFE: User settable from 3.6mA or 23mA.

MOUNTING POSITION: No effect on measurement value.

WEIGHT: AI-1500: 6 oz. XP-FN & FG: 2_ lbs. WP-HEAD: 12 oz

ISOLATION: Input to Output 500VAC

INPUT IMPEDANCE: Greater than 1 MΩ

POWER SUPPLY: The transmitter operates on 12 to 42 VDC (30VDC for I/S installations) with no load. Transmitter is protected against reverse polarity connection.

LOAD LIMITATIONS: Loop resistance including optional indicator:
R(KΩ) = (Supply Voltage - 12 VDC) / (23mA)

INTERCHANGEABILITY: Fully interchangeable without field calibration

ELECTROMAGNETIC COMPATIBILITY (CE COMPLIANCE):
Transmitter operates within specification in fields from 20 to 1,000MHz with field strengths to 30V/m. Meets EN 50082-1 Generic Immunity Standard and EN 55011 Compatibility Emissions Standard.

DYNAMIC RESPONSE:
UPDATE RATE: 150 milliseconds (7 times per second), typical.
RESPONSE TO STEP CHANGE: 250 milliseconds, minimum; 1 second, typical.
START-UP TIME: 7 sec. Operation to specification less than 30 sec.
AMBIENT TEMPERATURE CHANGE: Self-correcting for ambient temperature changes up to 20°C/hr.

HAZARDOUS LOCATION CERTIFICATIONS:
Explosion Proof: Explosion Proof Housings available with and without windows; CSA and FM approved for Class I, Div I & Div II, Groups B, C, & D; Class II, Div I & II, Groups E, F & G, Class III and are rated for NEMA 4X and NEMA 7 environments.
Nonincendive: Transmitter is CSA and FM rated nonincendive in Class I, Div II, Groups A, B, C & D; Class II, Div II, Groups F & G, Class III, Div II, CENELEC Ex N IIC T4-T6 certification pending.
Intrinsic Safety: The Intrinsically Safe Rated Model AI-1500 I/S is CSA and FM rated Intrinsically Safe for Class I, Div I, Groups A, B, C & D & Class II, Div I, Groups E, F, & G, & Class III, Div I, when installed per AIC Drawing 6022588, Rev A. See manual for details.
CENELEC EEx ia IIC T4-T6 Intrinsically safe certification pending.

OPTIONS:
INTRINSIC SAFETY: Order the AI-1500 I/S
HOUSINGS:
XP-FN: NEMA 7 Explosion-Proof, NEMA 4X Housing
XP-FG: NEMA 7 Explosion-Proof, NEMA 4X with Window
XP-HEAD: NEMA 7 Explosion-Proof, Rain-tight Head
WP-HEAD: IP66 Weatherproof Head
DISPLAYS:
DK-1: One-Line Local Display and Keyboard
DK-2: Two-Line Smart Local Display and Keyboard
THERMOWELLS: Order as required. See Accutech Bulletin PROB
SENSORS: Order as required. See Accutech Bulletin PROB
EXPLOSION-PROOF CERTIFICATION: Consult factory for details
MOUNTING: PY-2 2" Pipe Yoke for XP-FN & XP-FG housings
DIN-KIT R2 DIN Rail Mounting Adapter

STANDARD CONFIGURATION:
Sensor Input J Type Thermocouple
LRV (4mA) 40°F Lower Range Value
URV (20mA) 200°F Upper Range Value
Damping 0 seconds
Output Linear with Temperature
Failsafe Upscale (23mA)

ORDERING INFORMATION: Please order Model AI-1500.
Specify custom configuration, options and companion products as desired.

NOTE: Please note that specifications are determined with the factory default software settings or with the various software parameters set to optimize the performance for a given specification.

AI-2000 TEMPERATURE TRANSMITTER

Model
AI-2000 Revision 4
Smart Temperature Transmitter

Highlights

- **Guaranteed Measurement Stability**
- **Digital Ambient Temperature Compensation**
- **Automatic Self-Calibration**
- **Two Year Calibration Warranty**
- **Accepts virtually any Thermocouple or RTD**
- **Local and Remote Communication**
- **No need for Software Upgrades**
- **Explosion Proof Head or Pipe Mounting**
- **DIN Rail mounting capabilities**
- **Meets highest performance accuracy requirements**
- **Truly Smart – Use Smart Communications® or Display Mode Configuration**
- **21 point custom linearization capabilities**
- **RTD-CAL available for industry leading system accuracy**

The AI-2000 Rev. 4 was introduced in 1991 and set the standard for accuracy and stability for temperature measurement in industrial process applications. Its automatic self-calibration and digital ambient temperature compensation has been unrivaled in the process instrumentation marketplace. The AI-2000 Rev. 4 was the first transmitter to offer a 2 year calibration guarantee traceable to NIST standards. Now, the AI-1500 extends this same unique guarantee to three years.

Hundreds of process facilities worldwide depend on the AI-2000 Rev. 4 for their critical temperature measurements. The Stability, Accuracy, Versatility and Ease-of-use of the AI-2000 Rev. 4 allows process facilities to make better products. Off-the-shelf delivery and competitive pricing give customers the flexibility and confidence to standardize on the AI-2000 Rev. 4 Smart Temperature Transmitter.

AI-2000 Rev. 4 Specifications:

DIGITAL OUTPUT ACCURACY: ±0.04% of the millivolt or ohm equivalent reading, or the accuracy from the table below, whichever is greater, plus the effect of a cold junction measurement error of ±0.25°C (±0.45°F) if using a thermocouple sensor.

INPUT	DIGITAL ACCURACY		INPUT	DIGITAL ACCURACY	
B T/C	±0.8°C	±1.44°F	S T/C	±0.6°C	±1.08°F
E T/C	±0.2°C	±0.36°F	T T/C	±0.2°C	±0.36°F
J T/C	±0.2°C	±0.36°F	Millivolt	±0.008 mV	
K T/C	±0.2°C	±0.36°F	Pt RTD DIN	±0.1°C	±0.18°F
N T/C	±0.2°C	±0.36°F	Pt RTD (US)	±0.1°C	±0.18°F
R T/C	±0.6°C	±1.08°F	Ni RTD	±0.1°C	±0.18°F

LINEARIZATION: Thermocouple and RTD linearization to ±0.05°C. Custom linearization user programmable at 21 points.

OUTPUT: Analog, Two-wire 4 to 20mA
Digital, Two-wire (RS-232, 300 baud with CA-100 adapter)

OUTPUT RANGING ADJUSTMENTS:

Analog Zero:	100% of Sensor range – Noninteracting
Analog Full-scale:	Normal or Reverse Acting
Digital Mode:	°C, °F, °K, °R, mV (no ranging req'd)

ANALOG ACCURACY: Digital accuracy plus ±4 μA

REPEATABILITY: One-half the respective accuracy

DYNAMIC RESPONSE:
Turn-on Time: Less than 5 seconds after power-up
Ambient Temperature Gradient: Automatic compensation to 20°C/hour change
Update Time: 0.15 second; Digital, 1 second
Response To Step Input: Analog; 0.25 second, typical Digital; 1 second,
typical, to 95% of final value, 5 seconds, to stated accuracy

COLD JUNCTION COMPENSATION: Automatic correction to ±0.25°C

AMBIENT OPERATING TEMPERATURE: -40 to+167°F (-40 to +75°C)

AMBIENT STORAGE TEMPERATURE: -58 to+185°F (-50 to +85°C)

AMBIENT TEMPERATURE STABILITY: Self-correcting over the ambient
Temperature

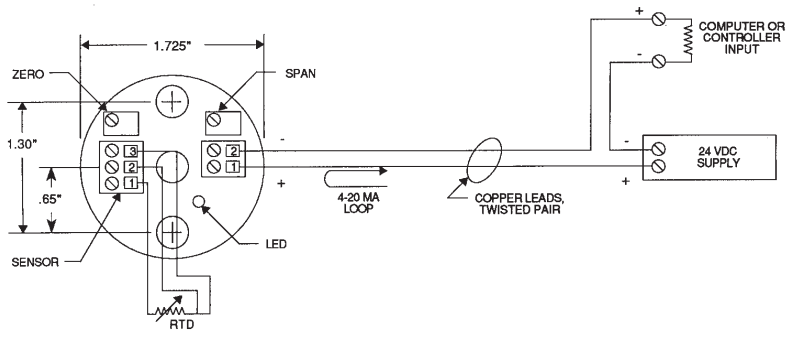
LONG TERM STABILITY: Less than 0.5% of reading plus ±2.1 mA per year

AUTOMATIC DIAGNOSTICS: Every 3 seconds, self-checks for zero, span, cold junction, calibration references, malfunction, and sensor failure

EMI/RFI IMMUNITY: Less than 0.5% of reading (SAMA PMC 33.1c test method) 20 kHz to 1000 MHz, 10 V/meter

ISOLATION: 850 VDC or peak AC

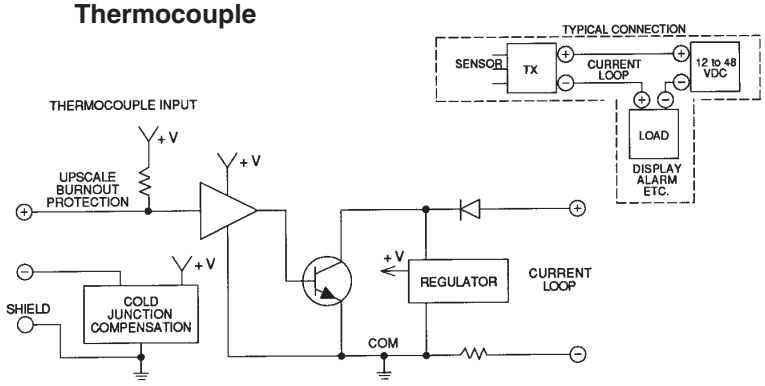
WARRANTY: 2 Year NIST Traceable Guarantee with Certificate of Conformance



Specifications subject to change without notice.

NON-ISOLATED TRANSMITTERS

The series N transmitter is a non-isolated 2 wire temperature transmitter. The transmitters are completely potted in a special epoxy with only the screw terminals exposed. **Specification of two wire non-isolated transmitters are as follows:**

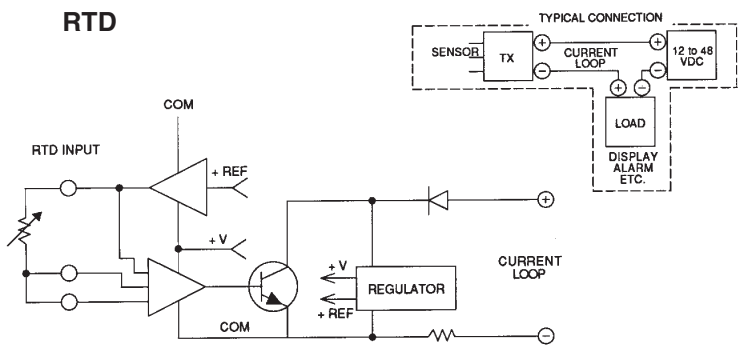


OUTPUT:
4/20mA, two-wire (loop-powered) output
ACCURACY:
±0.1% of span or better (factory calibration)
OPEN INPUT:
Offscale high output (T/C, RTD only)
TEMPERATURE:
±(0.02% + 1uV/°C or better
STABILITY:
-40 to +80°C (-40 to 176°F)
POWER:
Loop Powered. 12V min, 36V max at output
INPUTS:
DC spans 2mV to 250V, or 1 to 100mA current thermocouple minimum span

Installation Instructions:

Block Diagrams and Terminal Connections

Thermocouple



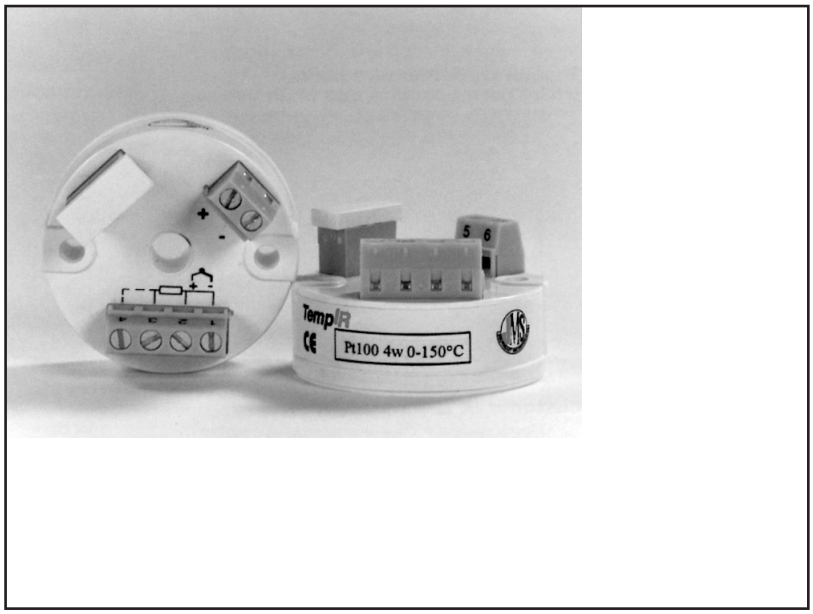
Series: 8N

Wiring: For a thermocouple input, the first two terminals looking at the transmitter from the front, are for the (+) and (-) output signal. The thermocouple shield, if used, should be connected to the third terminal from the left. The (-) negative thermocouple lead (usually red), should be connected into the fourth terminal. The (+) positive thermocouple lead should be connected to the fifth terminal.
<u>This transmitter is not recommended for grounded thermocouples.</u>

Series: 8N

For an RTD input, the power supply and output are connected on terminals one and two as described above. The negative/common leads (red) should be connected to terminals 2 and 3. The positive (white) lead should be connected to terminal 1.

RTD



SECTION 8

ISOLATED TRANSMITTERS

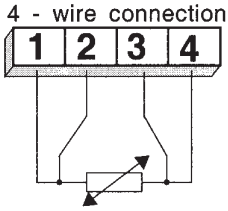
The JMS 8H, I, and E series isolated transmitter (TempIR) is a 2-wire loop-powered intelligent transmitter. Small size and extreme versatility makes the TempIR an ideal choice for all industrial instrumentation. The transmitter is manufactured for inputs from a wide range of RTD's, thermocouples, plain mV, and resistance. A customized linearization can easily be generated.

A wide power supply range allows for high load in the output loop, e.g. long output leads and multiple instruments. TempIR is configured with TemPRO, the general software to configure the entire temp-family. The program is Windows driven and easy to use. The configuration can be performed on-line, with in and outputs connected. While receiving new parameters, the transmitter will freeze the output signal and return to normal operation after completed transmission of the new parameters.

The 8H series transmitters are microcontroller based and do multiple measurements beyond the standard measurements. One of these controls is to monitor the isolation resistance of the sensor and the sensor leads. This function named, TempIRsense, is available for thermocouples and 3-wire RTD's (see page 8-25 and 8-26 for a technical note).

Performance and design:

- **Excellent stability**
  Long-term stability 0.1% / year.
- **Enhanced total system accuracy**
- **Input-output isolation 1500 VAC**
  Eliminates measuring errors due to ground loops.
- **High load capacity**
  Only 6.5 V voltage drop over the transmitter allows for high loads.
- **Designed for harsh conditions**
  Operation temperature: -40 to +85°C, -40 to +185°F.
  Excellent EMC performance.
  Durable, shockproof design.
- **Simplified mounting and connection**
  For DIN B head or larger.
  Large center hole (dia. 7mm / 0.28 inch).



Standard Inputs for:

- **RTD's, Thermocouples, mV and resistance**
  Reduced inventory costs.
  Simplified plant engineering.
- **True on-line configuration**
  Full access to all features while in operation.
- **Customized 40 point linearization**
- **TempIRsense, unique monitoring of insulation resistance**
  Detects low sensor isolation (see below).
  Selectable sensor break action.
- **Simplified loop check-up**
  The transmitter works as an accurate current generator.
- **Easy to configure**
- **On-screen indications and line recording**
  Valuable tools for temporary measurements.

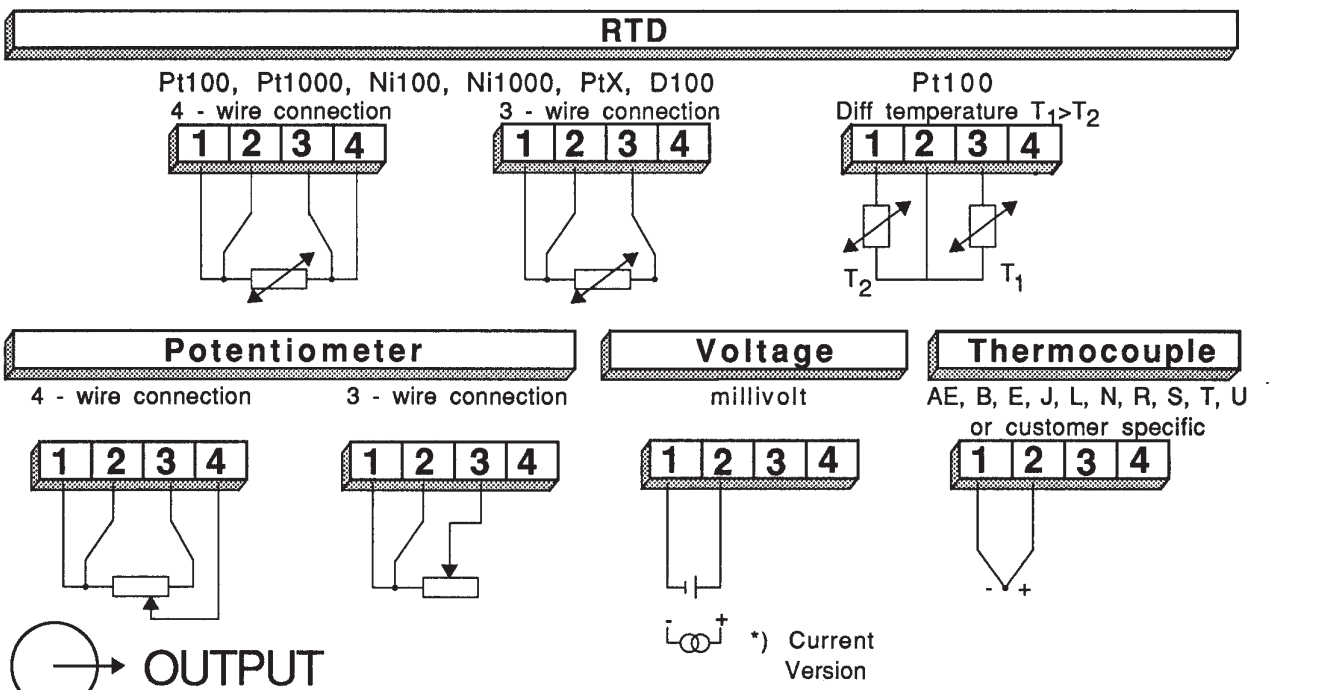
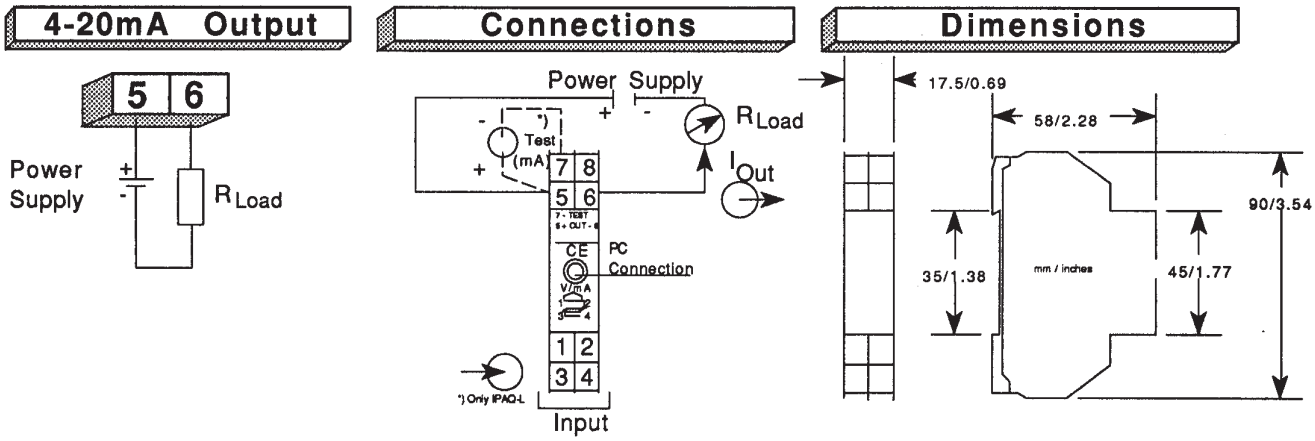
ISOLATED TRANSMITTERS

The JMS 8H, I, and E are available in a Universal Intelligent 2-wire DIN Rail Transmitter. The combination of competitive pricing, functionality and simple configuration has made these DIN rail transmitters the leading transmitter for industrial temperature measurements.



Performance and design:

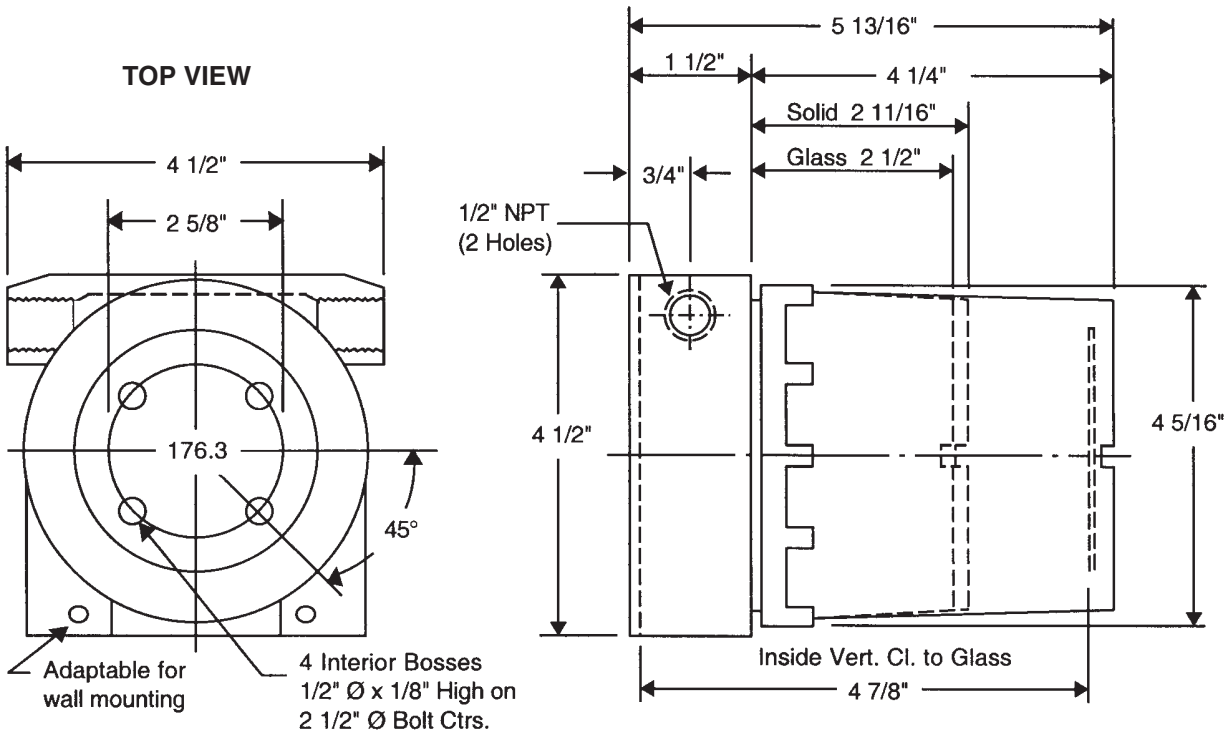
- Excellent Stability
- Long-term stability 0.1% / year
- Input-Output isolation 1500 VAC
- High load capacity
- Designed for harsh conditions
- Space Saving and simple mounting



Functions:

- Input for RTD's, T/C's and mV and resistance
- Input for mA
- True on-line communication
- Sensor Diagnostics
- Simplified loop check-up
- On-screen indications and line recording

INPUTS



OUTPUT

SECTION 8

MODEL 888

- Thermocouple and RTD input.
- RFI sensitive.
- Continuous span and zero field adjustability to 10% of designated span.
- Acceptable for hazardous locations. May be used in Class 1, Groups B, C, D, Class II, Groups E, F, F, and Class III, NEMA 4. See section 8 page 23 and 24 for FM classifications.
- On thermocouple model, cold junction compensation is included.
- Analog or digital temperature indication.
- Isolated or non-isolated transmitter.
- 5 year warranty.

SPECIFICATION

- *Isolation:
  1kV optical isolation peak to peak.
- *Calibration Accuracy:
  +/- 0.1% of calibrated span of output.
- *Linearity/Repeatability for RTD transmitters:
  +/- 0.1%
- *Inputs:
  RTD, thermocouple, millivolt signal, DC voltage and milliamp signal.
- Stability:
  +/- 0.2% of calibrated span for 6 months.
- Outputs:
  4-20 mA DC.
- Span:
  Specify span needed.
- Power Supply:
  24 VDC +/- 10% regulation.
- Noise Rejection:
  Extremely high common mode and normal mode rejection.
- Span and Zero:
  Adjustable continuously to 10% or range designated.
- Approximate Output Limits:
  3.8 mA DC minimum and 26 mA DC maximum. Upscale burn-out.
- Turn-on time:
  2 seconds, no warm up required.

*Indicates **"twice as good".**

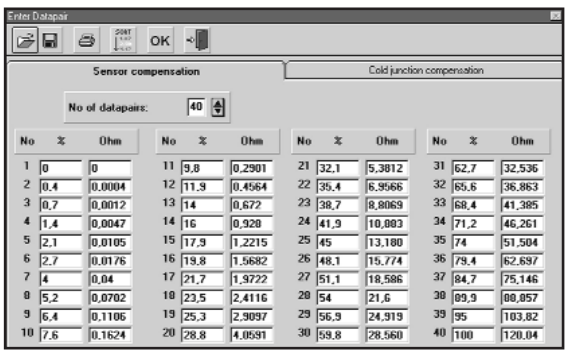
SECTION 8

TemPRO - The user friendly software for TempIR

TemPRO 4.03 is the software with which all user-configurable parameters in TempIR can be reached. TemPRO 4.03 is compatible with windows 3.1 and Windows 95. The software lets you prepare configurations, save them as files and transfer them to any TempIR transmitter. The program is menu-driven and easy to learn. In addition, TemPRO 4.03 configures all products of the Temp family.

Software Features

Engineered Units



• Ability to use engineering units for directly specifying custom ranges.
• Can be changed instantly by re-arranging the engineering unit.

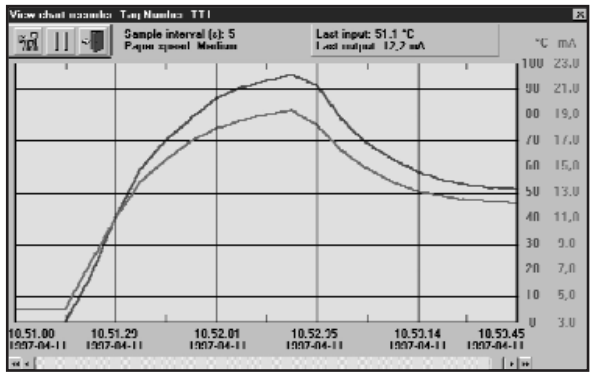
Customized Linearization

•Utilized in two ways: either by entering datapairs or entering coefficients of a polynomial.

Datapairs

• Up to 40 datapairs can be entered to describe the input signal.
• Up to 7 datapairs can be entered to describe the cold junction compensation of a thermocouple.
• See Fig. 1

Documentation



• Configuration protocols can be printed for future use.
• Protocols are time stamped for traceability and furnished with user space for calibration notes.
• Up to 128 characters, for documentation purposes, can be stored in the configuration file.

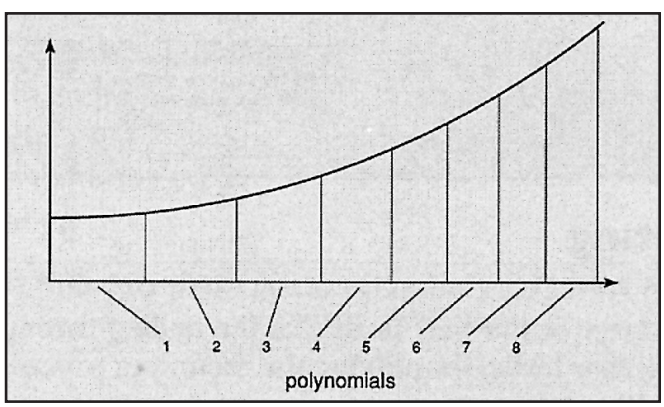
On Screen Indication

• TemPRO 4.03 will show the measuring values on screen in real time.
• Updating time is user selected.
• Values are displayed in numericals, meters, or bargraphs.
• A lineprinter simulation is a useful feature for startup procedure, etc.
• See Fig. 4

Utilities

• Field calibration permits adjustment of the transmitter in one or two points.
• For this function the sensor / transmitter is subjected to a calibration source (i.e. oven).
• °C, °F are selectable at any time.

Software Requirements



• TemPRO 4.03 is a Windows program.
• Runs on a PC with Win 3.1 or higher or Windows 95.
• Minimum processor requirements are 486, at least 3 MB free hard disk space and a VGA display (640 x 480).

Polynomial

• For polynomial coefficients a sensor can be described by third order polynomials.
• The signal to be linearized can be divided into a maximum of 8 parts where each part is individually described by a separate polynomial of the highest possible accuracy.
•Interesting parts of the signal can be linearized with a higher degree of accuracy.
• The cold junction compensation of a thermocouple can be divided into a maximum of 4 polynomial parts.
• See Fig. 2

File Handling

•Configuration files can be stored for future use.
•TemPRO 4.03 has the ability to save configuration data in ASCII text format.

Windows and Windows 95 are registered trademarks of Microsoft Corporation. PC is a registered trademark of IBM Corporation.

The influence of insulation resistance on temperature measurements

Technical Note

How to get an early warning of low insulation resistance

This Technical Note describes how the insulation resistance influences the measurements on RTD's and thermocouples and how to get an early warning regarding errors due to low insulation.

The structure of an RTD and a thermocouple have properties which can lead to erroneous measurements. This is independent of brand and type. One of the most common sources of error is the insulation in the thermometer, which, if too low, can give a serious degradation of the measurement. Insulation can be lowered by moisture, heat, vibration. Physical or chemical influence or radioactive influence. This Technical Note will give an explanation to the necessity of keeping an eye on the insulation resistance.

RTD's

The RTD element is a low-resistance sensor and a too low insulation resistance will influence the measurement. Figure 1shows the electrical schematic for an RTD and the insulation resistance connected to a temperature transmitter.

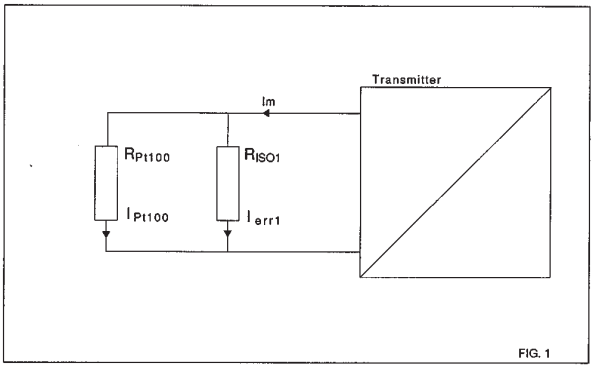


FIG. 1

The measuring current goes through the RTD element, but a negligible fraction is normally passing through the high insulation resistance Riso 1. When the insulation is lowered, a greater fraction of the current will pass through the insulation. As a result of this, the measured voltage over the combined resistance of RTD and insulation resistance will be lower than if the insulation resistance was sufficiently high. This will give a too low measured temperature value and this is not dependent on whether the transmitter is isolated or not. If the transmitter is without galvanic isolation between input and output, a low insulation resistance between sensor and earth can carry a part of the measuring current. This will also give a too low indicated temperature. With an isolated transmitter this will not happen. Please see Figure 2.

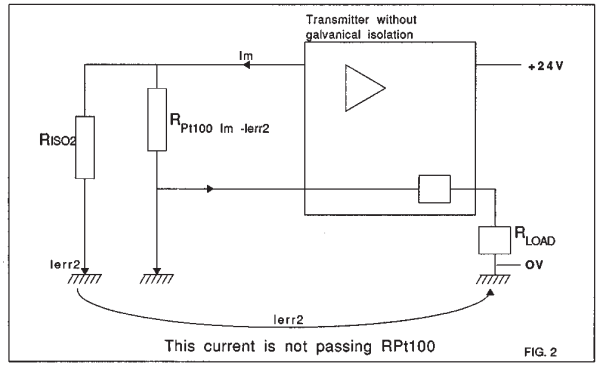

FIG. 2

Thermocouples

Low insulation in thermocouple sensors will give other errors. EMF from the thermocouple is not particularly sensitive for low insulation. The problem is rather that a low insulation will give a new measuring point on the location of the low insulation. If this location is near the intended measuring point, the error will be negligible. If the low insulation is in a location where the temperature differs from the measuring point, there is a possibility of a significant error. Low insulation in thermocouples can also give problems with the indication of sensor breakage. Pleas see Figure 3.

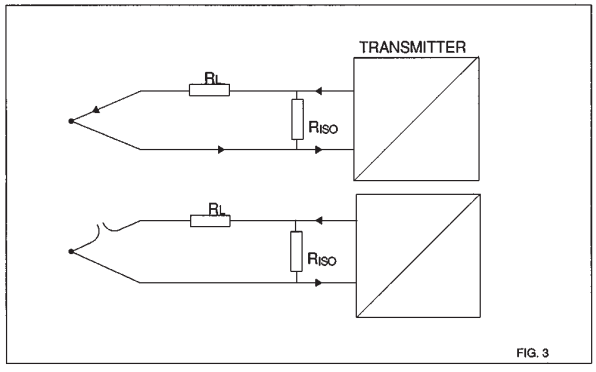

FIG. 3

Monitoring the insulation resistance

The TempIR transmitter is microcontroller based and does a couple of measurements and controls beyond the standard measurements. One of these controls is to monitor the insulation resistance of the sensor. To accomplish this the sensor must be furnished with an extra conductor. Under certain circumstances there is a possibility of using the cable shield. See below. When the insulation resistance is too low, the TempIRsense will signal this with a twinkling LED (on some models) and the output signal will go to a preprogrammed value.

RTD's

For RTD's the limit in insulation is 500 Kohm. By 400°C the added error is 0.4°C. If the insulation is lowered to 100Kohm there will be an added error of 1.6°C. See Figure 4

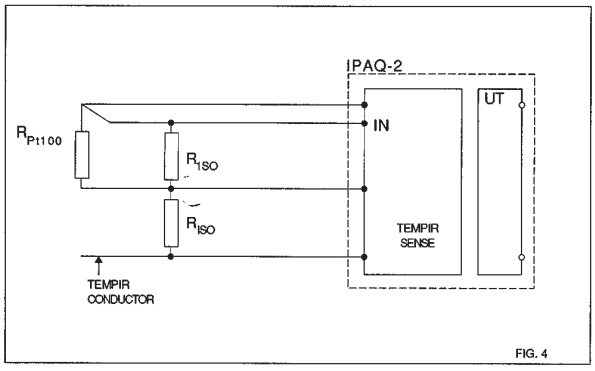

FIG. 4

Thermocouples

For thermocouples the limit of low insulation is 50 Kohm. The added error depends on the relation between the lead resistance R and the insulation resistance Risq. The error is also dependent on the temperature difference between the measuring point and the location of the low insulation. Under the following circumstances, measuring temperature 1000°C, ambient temperature 25°C and R equals 50 Ohm there will be an error of 1% if the insulation resistance is 5Kohm. This equals 10°C. It is assumed that the low insulation is in the are with 25°C.

Sensor Solution

TempIRsense is applicable for 3-wire RTD's and thermocouples. For correct usage the sensor must have an extra conductor. This conductor will have a separate terminal and go through the sensor all the way to the sensor element. See Figure 5.

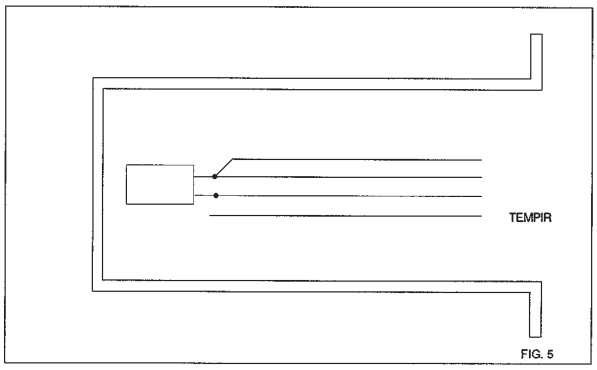

FIG. 5

Mineral insulated RTD's and thermocouples use an unconnected conductor. Due to the low insulation resistance in mineral insulated thermocouples at high temperatures, it is not useful to monitor the high temperature end, above 5-600°C depending on application. Instead, it is important to monitor connections and cables from the sensor to the transmitter. It is not recommended to use the housing of the sensor as the monitoring conductor.

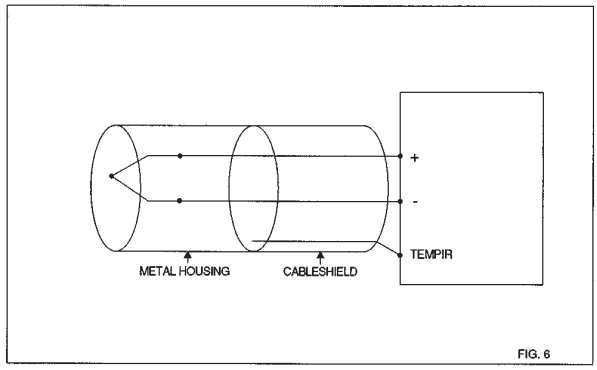

FIG. 6

One task of the housing is to keep interference outside the measurements. Connecting the housing to the TempIRsense terminal can lead to erroneous measurements. This is also applicable to cable sensors. See Figure 6.

Conclusion

Full control over
sensor and connection

Too low insulation resistance in temperature sensors can give erroneous measurement independent of brand and type. TempIRsense gives the possibility of substituting sensors with low insulation resistance in 3-wire RTD's and thermocouples in time. TempIRsense does not only monitor the sensor but also the conductors from the sensors terminal to the transmitter terminals. This gives full control on the condition of the measuring chain from measuring point to transmitter.

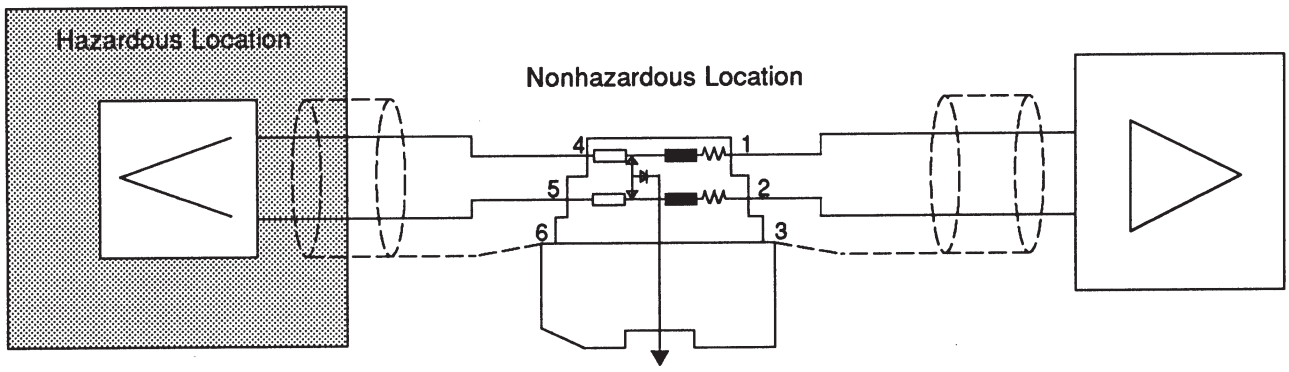
Causes of low insulation

- Moisture
- Contamination
- Physical influence (wear, jamming)
- Chemical influence (corrosion)
- Vibration
- Radioactive radiation

Examples of errors

RTD @ 400°C

Insulation Riso	Error
500K	0.4°C
100K	1.6°C
50K	3.1°C
10K	15°C



Thermocouple type K @1000°C

Insulation Riso	Error
50K	1°C
20K	2°C
5K	10°C

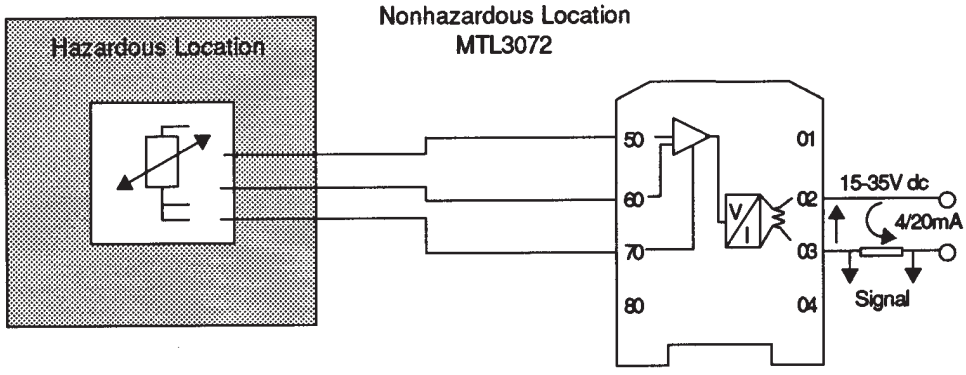
*24Ω ±0.15Ω @ 20°C, Channels track within 0.15Ω from -20 to +60°C

JMS recommends and uses MTL Intrinsic Safety and Galvanic Isolation Barriers

ISOLATED INTRINSICALLY SAFE TEMPERATURE

Thermocouple Input for Hazardous Location Groups A - G [using Galvanic Isolation Devices]

Technical Data



Rated Supply Voltage	24V (15 to 35Vdc)
Protection Fuse	50 mA
Power Consumption	0.46 watts max.

Input Data
- T/C type: J, K, E, T, R, N (or mV)
- Span: 4-60mV
- Zero: -12 to +60mV

Load Specification
- 4-20mA

A simple apparatus is a device which will not generate nor store more than 1.2 V, 0.1A, 25mW, or 20 uJ. Some examples include switches, RTDs, thermocouples, and LEDs. Since these devices cannot contribute energy of sufficient magnitude to ignite a hazardous mixture under a fault condition, they may be connected to a certified intrinsically safe circuit, via an associated apparatus, without the evaluation of a third party testing agency.

RTD Input for Hazardous Location Groups A - G [using Galvanic Isolation Devices]

Technical Data

Rated Supply Voltage	24V (15 to 35Vdc)
Protection Fuse	50 mA
Power Consumption	0.46 watts max.
Current Supplied to Field	400μA
Line Resistance:	100Ω max. each line

Input Data
- RTD: 2-3 wire 100Ω Platinum
- Span: 25 to 800°C
- Zero: -200 to +400°C
- Potentiometer: 0-300Ω

Load Specification
- 4-20mA

For all practical reasons no electrical circuit is inherently intrinsically safe. An intrinsically safe system consists of an Associated Apparatus, either a simple or Intrinsically Safe Apparatus, and interconnecting wiring. When properly installed, the incidence of abnormal spark-causing conditions such as electrical equipment failure, miswiring, overvoltage application to the circuit, or grounding, shorting, or open-circuiting of any lead(s) in the presence of a hazardous mixture, shall not be of sufficient energy to cause ignition.

JMS recommends and uses MTL Intrinsic Safety and Galvanic Isolation Barriers

HAZARDOUS LOCATIONS AS CLASSIFIED IN NORTH AMERICA

Hazardous (Classified) Locations In Accordance with Article 500, National Electrical Code - 1990

Class I
Flammable Gases or Vapors

Division 1

- Exists under normal conditions
- May exist because of
  - repair operations
  - maintenance operations
  - leakage
- Released concentration because of
  - breakdown of equipment
  - breakdown of process
  - faulty operation of equipment
  - faulty operation of process which causes simultaneous failure or electrical equipment

Division 2

- Liquids and gases are in closed containers or the systems are:
  - handled
  - processed
  - used
- Concentrations are normally prevented by positive mechanical ventilation.
- Adjacent to Class I, Division 1 location

Group A: Atmospheres containing Acetylene

Group B: Atmospheres such as Butadiene, Ethylene Oxide, Propylene Oxide, Acrolein, or Hydrogen (or gases or vapors equivalent in hazard to hydrogen such as manufactured gas.)

Group C: Atmospheres such as Cyclopropane, Ethyl Ether, Ethylene, or gases or vapors equivalent in hazard.

Group D: Atmospheres such as Acetone, Alcohol, Ammonia, Benzine, Benzol, Butane, Gasoline, Hexane, Lacquer Solvent vapors, Naphtha, Natural Gas, Propane or gases or vapors equivalent in hazard.

*See page 6 - 16 for more details

HAZARDOUS LOCATIONS AS CLASSIFIED IN NORTH AMERICA

Class 2
Combustible Dusts

Division 1

- Exists under normal conditions
- Combustible mixture produced by:
  - mechanical failure of equipment or machinery
  - abnormal operation of equip ment and provide source of ignition from:
  - simultaneous failure of electrical equipment
  - simultaneous failure of opera tion of protection devices
  - other caused
- Electrically conductive dusts may be present

Division 2

- Not normally in the air
- Accumulations normally sufficient to interfere with normal operation of electrical equipment or other apparatus
- In the air as a result of infrequent malfunctioning of:
  - handling equipment
  - process equipment
- Accumulations are sufficient to interfere with the safe dissipation of heat from electrical equipment
- Accumulations may be ignited be abnormal conditions or failure of electrical equipment

Group E: Atmospheres containing combustible metal dusts (regardless of resistivity), dusts of similarly hazardous characteristics (<100 kΩ/cm) or electrically conductive dusts

Group F: Atmospheres containing combustible Carbon Black, Charcoal or Coke Dusts which have > 8% total volatile material or if these dusts are sensitized so that they present an explosion hazard and having a resistivity > 100 KΩ/cm but ≤ 100 MΩ/cm

Group G: Atmospheres containing combustible dusts having a resistivity > 100 KΩ/cm or electrically nonconductive dusts

Class 3
Ignitable Fibers or Flyings

Division 1

- Fibers or materials producing combustible flyings are manufactured, stored of handled

*See page 6 - 16 for more details

Not Grouped

- Manufacturers such as textile mills, cotton related mills or clothing plants
- Fibers and flyings include Rayon, Cotton, Sisal, Hemp, Jute and Spanish Moss

Division 2

- Fibers are handled except during the process of manufacture or are stored except during the process of manufacture

PLUG-IN SIGNAL CONDITIONERS

FEATURES:
- Isolate, Amplify and Convert Measurement Signals
- Quick-Check LED Output Indication (Most Models)
- 5 Amp, 230VAC Relay Contacts
- Plug-In: Replace without Rewiring
- Industry-Standard Printouts
- DIN/Surface/Track Mount Sockets Available
- AC and DC Powered Models Available
- Seven Year, Full Replacement Warranty

SINGLE ALARM

These Transmitters and Alarms amplify, translate, isolate, and alarm on most standard transducer signals as well as DC, AC and frequency inputs. Used in a variety if industrial and process applications, they provide low-cost answers to many measurement, monitoring and control needs.

The broad product range covers most standard transducers as well as some not-so-standard, such as thermistors and IC temperature sensors. All transmitters are available with optional input/output isolation, providing 1,000 Vrms isolation and better than 0.05% linearity. Red/green LEDs indicate alarm status and, on most transmitter models, provide a quick check of the output level.

Proven designs using low-drift ICs and circuitry provide accurate, stable operation. Quality and reliability are enhance by 100% burn-in and are backed by a seven-year, full replacement.

Available options include AC or DC power, reverse-acting outputs, and urethane coating.

SPECIFICATIONS:

Transmitter Outputs:	Voltage: 0/1v min, -10/+15v max Current: 0/1mA min, 0/25mA max
Accuracy:	±0.1% of span or better (AC inputs ±0.5% of span)
Temp. Stability:	±0.02%/°C or better, -10 to +60°C
Isolation:	Input/Output (optional) -1,000Vac rms Power -1,500Vac rms
Relay Contacts:	Single Alarm, DPDT (2 form C) Dual Alarm, one SPDT (1 form C) per trip point 5A max resistive @ 115/230Vac or 30Vdc, 1/8HP max AC inductive
Set Point Adjustment:	0% to 100% of range, with 0.1% resolution
Deadband Adjustment:	0.25% to 100% of range
Power:	AC: 115 or 230Vac, 2.5VA DC: 12 or 24Vdc, 2.5W

STANDARD TRANSMITTERS AND ALARMS:

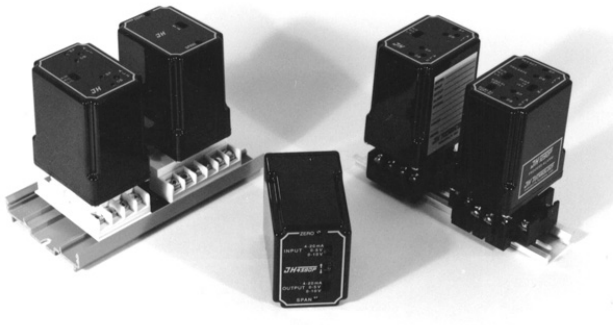
PLUG-IN SIGNAL CONDITIONERS

ADDITIONAL PRODUCTS:
- Switch-Selectable Inputs
- Loop Power for 2 Wire Transmitter
- Add, Subtract
- Multiply, Divide
- Square, Square Root
- Power Supply



Special-function modules complement the product line, providing the “glue” often needed to complete your system requirements. Process Input Transmitters and Alarms provide top-access switches, allowing the user to select 0-5V, 0-10V or 4-20mA inputs and outputs. Alarms may be set for HI/HI, HI/LO or LO/LO trip, or switch to act as single-trip alarms. Loop-Input modules include 24V regulated excitation to power 4-20mA two-wire input sources.

GROUP with PROBE

Flow computations, averaging, ration measurement and other functions are made possible using the Math Function modules.

FUNCTIONS	TRANSMITTERS		ALARMS

Mid-West®
Instrument

BULLETIN NO. IM120/10

Model 120 Series "Filter Minder"®
Installation and Operating Instructions

INSPECTION

Before installation check the nameplate on each instrument against the receiving paperwork and the intended application for correct part number, materials of construction, working pressure, dial range, etc. If equipped with switches, check electrical rating, type of enclosure, etc. Inspect for shipping damage and, if damaged, report it immediately.

NOTE - Before attempting repairs contact your local Mid-West Representative or our factory. Failure to do so will void any warranty.

PRODUCT DESCRIPTION

The Model 120 Series "Filter Minder"® is a rugged, medium-range differential pressure instrument available as a switch, a gauge, or both. See "Part Numbering System". (Fig. 4) for available options.

Differential pressure is sensed by the movement of a floating piston magnet against a calibrated spring. The magnetically coupled gauge pointer outside the pressure housing follows the movement of the piston magnet and indicates differential pressure on the dial scale.

When equipped with switches, a contact is made or broken by the magnetic field of the piston magnet. See Bulletin ELECIM120/latest for gauges with switches.

The unit provides full over-range protection to the rated working pressure of the housing in either direction.

The precise piston/bore fit allows minimal leakage from high to low sides. This leakage is only 5 to 15 SCFH air at ambient conditions and a pressure differential of 100 PSID.

INSTALLATION

Model 120 Series "Filter Minder"® is calibrated and tested prior to shipment and is ready for immediate installation. Use of the following installation procedures should eliminate potential damage and provide optimum trouble-free operation.

1. CONNECTIONS

1/4" FNPT are provided as standard but check paperwork for connections ordered. There are two connections on the housing identified as "hi" and "lo" for high pressure and low pressure (Fig. 2). Be sure these get plumbed to the proper connections on your system. Improper connection will not damage the instrument, but it will not function properly. Flexible tubing is recommended to minimize the effect of any vibration that may exist.

2. INSTRUMENT LOCATION

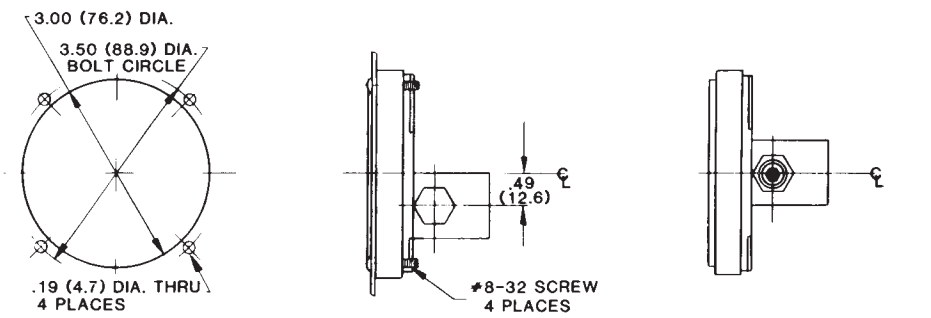
On liquid service the instrument should be mounted **below** the process connections to facilitate self-bleeding. On gas service it should be located **above** the process connections to promote self-draining. If the process contains particulates, a "pigtail" loop or drop leg (manometer "U-tube" configuration) in the tubing will minimize the possibility of it migrating into the instrument.

3. PANEL MOUNTING

Gauges with 2-1/2" dials can **only** be mounted through the **rear** of the panel. Make the proper panel cutout as indicated in (Fig.1). Remove the (4) bezel screws. Insert the gauge front through the rear of the panel and reinstall the bezel screws through the **front** of the panel and into the gauge bezel. Tighten the screws securely, alternating in a **diagonal** pattern.

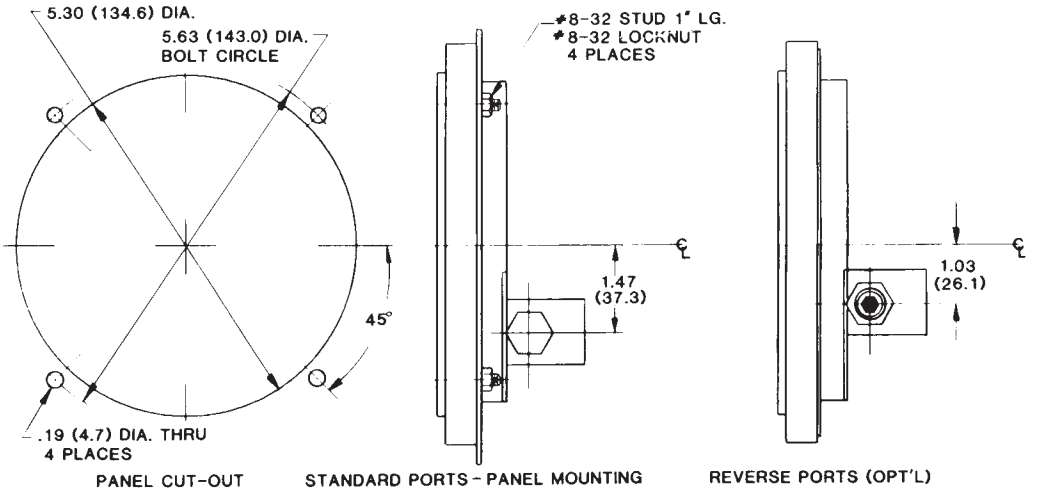
Gauges with 3-1/2" dial should be mounted from the front of the panel. Contact factory for mounting information and dimensional data.

Gauges with 4-1/2" dial should be mounted from the **front** of the panel. Make the cutout as indicated in (Fig. 1). Insert the (4) panel mounting studs, finger tight, into the metal inserts located in the rear of the bezel. Insert the gauge through the panel, aligning the panel mounting studs with the holes in the panel. Install the (4) #8-32 nuts onto the studs and tighten securely.



4. PIPE MOUNTING

An optional pipe mounting kit is available for mounting the gauge to a 2" vertical or horizontal pipe (Fig. 3).



TROUBLE SHOOTING

1. **Gauge does not indicate differential.**
   - A. Check for proper hook up, high to "hi" and low to "lo".
   - B. Make certain block valves are open and, if using a 3-valve manifold, that the equalizer (balance) valve is closed.
   - C. If A & B check out correctly, loosen or disconnect the high pressure line to determine if there is pressure to the instrument.
   - D. If there is pressure to the instrument, check to determine that there is differential across the unit being monitored. If so, contact the factory for assistance and/or an "RGA" (return goods authorization) number to return the instrument for repair or replacement.

3. DIAL TYPE
- A. 2-1/2" Round Uni-Directional engrd. plastic housing assy. **(Standard)**
- C. 4-1/2" Round Uni-Directional engrd. plastic housing assy.
- E. 3-1/2" Round Uni-Directional anod. aluminum housing assy.
- G. 4-1/2" Round Uni-Directional anod. aluminum housing assy.
- T. Non-indicating differential pressure switch only (select appropriate electrical option)
- Z. Special (Uncoded Options)

4. SEALS
- 0. Buna N **(Standard)**
- 1. *Viton®
- 2. Neoprene
- 4. **Teflon®
- 5. Ethylene Propylene
- 6. Perfluoroelastomer
- 9. Special (Uncoded Options)

* Viton® is a Registered Trademark of DuPont Dow Elastomers

** Teflon® is a Registered Trademark of DuPont

5. CONNECTIONS

(NOTE: Models 120M and 120N available only with end connections)
- 0. 1/4" FNPT back connections **(Standard)**
- 2. 1/4" FNPT end connections
- 3. 1/4" Bottom connections
- 4. 1/2" FNPT end connections
- 6. 7/16" – 20 straight thread "O" ring port (back connection)
- 7. 1/2" FNPT stainless steel adaptors (back or bottom only) available on material A & S only)
- 9. Special (Uncoded Options)

6. OPTIONS (Up to four options)
- O. None **(Standard)**
- A. Reversed high/low process connections not available with electrical options J & K
- C. Mounting holes in gauge body for field mounting of electrical configuration options A & B
- D. Mounting holes in gauge body for field mounting of electrical configurations options L & M
- F. Pipe mounting kit (carbon steel) not available w/C ,D, E or F electrical switch options.
- G. Pipe mounting kit (stainless steel) (no back or bottom connections for C, D, E or F electrical switch options)

NOTE: Not all options available in combination with other options.
NOTE: Factory preset switches at no charge (specify setting)
NOTE: The use of diaphragm seals is not recommended for Model 120 series gauge. Attempts to install such seals on this gauge will void the warranty. Manufacturer reserves the right to change specifications without prior notice.
PROOF PRESSURE: 12,000 PSI for models 120A and 120S. 10,000 PSI for models 120M and 120N.

Tel: 586-254-6500 Fax: 586-254-6509
www.midwestinstrument.com

OPTIONS (Up to four options) (continued)
- L. Liquid Fill (Not available w/follower pointer) (Not available with 3 ½" dial)
- M. Maximum indicator follower pointer
- N. NACE
- Q. CRN (Canadian Registration Number) Available on Aluminum or S.S. body only
- S. Shatterproof lens (available only with 4 ½" metal front)
- T. Oxygen Cleaning
- U. S.S. tag and Wire
- V. S.S. tag and screw (contact factory on switch options)
- W. Wall mounting kit (not available with back connections) (not available with E or F Electrical Configuration)
- Z. Special (Uncoded Options)

7. ELECTRICAL CONFIGURATIONS
(NOTE: All options CE marked except E, F, J & K)
- O. None
- A. One (1) switch in STD, enclosure with grommet wire seal
- B. Two (2) switches in STD, enclosure with grommet wire seal
- C. One (1) switch in STD, enclosure with ¼" FNPT electrical connection NEMA 4X
- D. Two (2) switches in STD, enclosure with ¼" FNPT electrical connection NEMA 4X
- E. One (1) switch in general purpose enclosure, Division 2 Hazardous Locations [1] [3]
- F. Two (2) switches in general purpose enclosure, Division 2, Hazardous Locations [1] [3]
- G. One (1) switch & gauge in NEMA 4X plastic enclosure (not available with end connection)
- H. Two (2) Switches & Gauge in NEMA 4X Plastic Enclosure (Not available with end connections)
- J. One (1) Switch in Explosion Proof Enclosure with Glass Window Cover, Division 1, Hazardous Locations [2] [3]
- K. Two (2) switches in explosion proof enclosure with glass window cover , Division 1, Hazardous Locations [2] [3]
- L. One (1) switch in STD, enclosure with plug-in connector (DIN43650/IP65-PG11)
- M. Two (2) switches in STD. enclosure with plug-in connector (DIN43650/IP65-PG11)
- Z. Special

(Note: 7 and 8 up to three options)

8. ELECTRICAL SPECIFICATIONS (For Resistive Loads)
- A. S.P.D.T., 3W, 0.25 Amp., 125 VAC/VDC (Standard) (Switch adjustable range of 10-90%)
- E S.P.S.T. , 60W, 3.0 Amp., 240 VAC/VDC (Normally open) (Switch adjustable range of 25-95%)
- F. S.P.S.T., 60W, 3.0 Amp., 240 VAC/VDC (Normally closed) (Switch adjustable range of 25-95%)
- G. S.P.S.T., 60W, 3.0 Amp., 240 VAC/VDC One (1) Normally open, One (1) Normally closed (Switch adjustable range of 25-95%)
- H. S.P.D.T., 60W, 1.0 Amp., 240 VAC/VDC (Switch adjustable range of 25-100%)
- Z. Special (Uncoded Options)

Instrument

Model 120 Electrical: Installation and Operating Instructions

ELECTRICAL

Gauges with switches have one or two hermetically sealed adjustable set point reed switch assemblies. Load ratings and capabilities for each switch type are defined as follows:

REED SWITCH RATINGS (Resistive Load)

Type	SPST	SPDT	SPDT
Option:	E ,F,G	H	A
*Power	60 W	60 W	3W
Max. Current	3.0 Amps	1.0 Amps	0.25 Amps
Max. Voltage VAC/VDC	240	240	125
**Setting (%F.S.)	25 to 95	25 to 100	10 to 90
Hysterisis (Max/Nom)	15% / 8% (F.S.)	20% / 13% (F.S.)	10% / 5% (F.S.)
Repeatability	1% F.S.	1% F.S.	1% F.S.
Leads 22 Awg.	(2), 24”	(3), 24”	(3), 24”

* Product of the switching voltage and current shall not exceed the power rating of the device.
** Except where otherwise noted

The SPDT switch ('A' or “H” Electrical Option) lead colors and associated functionality at '0' PSID is shown in Figure 1. SPST switches (' E', 'F', or 'G' Electrical Options) may be normally closed or normally open at '0' PSID dependent upon the option specified on the purchase order.

All switch types are field adjustable. The defined range of the adjustment is specified in the table above. All switches come with a decal to identify adjustment direction to increase the set point. **Do not use excessive force when rotating the adjustment screw as the adjustment mechanism may be damaged**. **Also note the location of the screw adjust (See Figure 4.) Do not mistake it for the calibration adjust for the gauge.**

Note: *Switches can be set below the defined minimum set point however, the switch may not remain activated at maximum PSID. If the unit is set below the defined minimum set point, the customer should verify that the switch remains activated from the set point to over range of the gauge.*

Provide standard protection techniques for the switch contacts for capacitive and inductive loads. Use current limiting techniques near the switch to protect the contacts due to high inrush (i.e.; in line resistor or inductor) for long cable interfaces. Provide clamping devices at or near inductive loads (i.e.; relay). **Maximum wire length between the 3W switch and its load, should not exceed 70 – 100 Feet**. **for 120 VAC** applications. Contact the factory for assistance regarding this condition.

Use the Mid-West Power Relay 1000TR or equivalent relay for loads above the switch rating,.

The following warnings apply to all gauge options with electrical interface:

WARNING: ELECTRICAL CONNECTIONS SHOULD BE PERFORMED BY QUALIFIED PERSONNEL AND MEET THE REPRESENTATIVE COUNTRY'S NATIONAL ELECTRICAL CODE.

WARNING: FAILURE TO CONNECT TO THE PROTECTIVE CONDUCTOR TERMINAL MAY RESULT IN A SHOCK HAZARD.

Grommet Wire / ¼” FNPT Wiring Interface

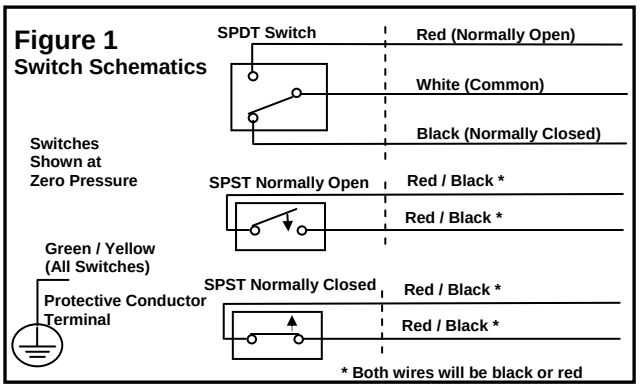
The standard switch enclosure is weather resistant with 24" flying lead wire interface. A rubber grommet provides the seal around the wires (See Figure 2). (Options A & B)

The conduit version provides a NEMA 4X rated environmental seal with a 1/4" FNPT wiring interface in the rear center of the gauge body (See Figure 3).(Options C & D)

A provision to connect a protective conductor terminal is provided on the High port end of the gauge body. A 6-32 screw, 18 Awg, 24 " long, green/yellow wire, and a #6 terminal is provided.

Standard location of a SPDT switch will be on the bottom of the gauge for a standard port gauge. For a reverse port gauge the switch will be on top. (See Figure 2). SPDT Switch leads are color coded and labeled as follows:

White- 1 or 2 Com **Black**- 1 or 2 NC **Red** - 1 or 2 NO



Location for the SPST switch will vary depending on the switch type required. A standard port gauge has the normally open switch located on the bottom of the gauge body and the normally closed switch located on the top. This applies to both a single switch unit or a double switch unit with one of each type ("G" option Electrical Specifications).

A reverse port gauge has the normally open switch located on the top and the normally closed switch located on the bottom. Leads are labeled as follows:

Single Switch Unit: 1NC or 1NO
Double Switch Units: 1NC or 1 NO and 2NC or 2NC

Deviations from the above configurations may exist. Therefore check the description block of your order to verify your configuration.

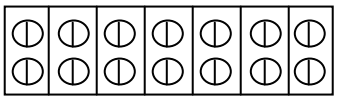
Figure 1
Switch Schematics

DIN Plug- in Connector (Options L & M)

The DIN interface conforms to DIN 43 650A / ISO 4400 and **when mated** provides an IP65 rated protection class. The right angle mating connector is supplied with the gauge upon order. Clocking (orientation) can be changed by prying out the insert and rotating the insert to the desired clocking (90 º increments). (See Figure 4)

Wiring for the SPDT bottom and top switch for the defined port configuration is as follows:

Standard Port. - 1.- Common, 2. - N.C., 3. - N.O.
Reverse Port - 1. - Common, 2. - N.O., 3. - N.C.



Wiring for the SPST switch is between terminals 1 & 2.

A protective conductor terminal is provided on the DIN connector.

NEMA 4X (Weatherproof Enclosure) (Options G & H)

The gauge and switch(es) are mounted inside the enclosure with the switch(es) wired to a seven (7) position terminal strip. The terminal strip connection uses 6-32 screws and is rated for use with wire up to 14 Awg.. An opening is provided on the bottom of the enclosure for a 1/2" flexible cable or conduit connection.

Access the terminal strip by removing the cover from the enclosure and loosening the (4) screws. Insert wires through an appropriate weatherproof connector (not supplied) into the enclosure and connect to the terminal strip. See the terminal strip diagram shown below or on the outside of the switch enclosure. Reinstall the cover and (4) screws (See Figures 5 & 6).

NO NC CM CM NC NO
SINGLE DOUBLE

Wiring to the terminal strip for SPST switches is defined by the functionality required. i.e.; a normally closed switch is wired between the CM and NC connections with the NO connection unused and a normally open switch is wired between the CM and NO connections with the NC connection unused.

Access holes and plugs are provided for external adjustment of the switches if required (Except Model 120 4 1/2" Dial). The cover for the Model 120 with 4 1/2" Dial must be removed to adjust the switch settings.

NEMA 7 (Explosion-proof) Enclosure (Options (J & K)

WARNING: THE COVER AND/OR SWITCH ADJUST ACCESS PLUGS MUST NEVER BE REMOVED WHEN THERE IS POWER TO THE UNIT. MAKE ALL ADJUSTMENTS IN A NONHAZARDOUS AREA.

The gauge and switches are mounted inside the enclosure (See Fig. 8). A 1/2"-14 FNPT conduit connection is provided in the bottom side of the enclosure. A proper explosion proof, dust tight, sealing fitting with appropriate sealing cement must be used when making connections to the 24", 18 Awg. wire leads. The leads are labeled and/or color coded as described in the grommet / conduit section.

Adjustment of the set point can be accomplished by removing the switch adjustment access plug(s). Insert the screw driver through the hole into the switch adjustment slot and rotate until the desired set point is reached. **Do not use excessive force**. **Reinstall the access plugs with at least 5 threads of engagement after completion.**

Enclosures with SPDT or SPST switches comply with NEC Class 1, Groups **C & D**; Class 2 Groups E,F, & G, NEMA 7 and 9. All switches are CSA / NRTL listed.

Division II Hazardous Ratings (Options E & F):

The **E & F** Electrical Configuration are 3RD party certified for **Class I, Division II, Groups A, B, C, & D, Class II, Groups F & G** hazardous environments. The CSA mark identifies the product has been tested to the applicable **US standards** and the applicable Canadian standards.

Interface is 24", 18 Awg. flying leads with ½" FNPT Conduit. (See Figure 7)

MISCELLANEOUS

Bi-directional Dial:
SPDT Switch units, with the bi-directional dial, require the following setting instructions:

1. If the switch is to operate for positive ΔP, rotate the adjusting screw Counter Clockwise (Red - NO, Black- NC, White- Common).
2. If the switch is to operate for negative ΔP, rotate the adjusting screw Clockwise (Red- NC, Black- NO, White -Common)

The functionality of SPST switches will be reversed for negative ΔP and positive ΔP. i.e.; a normally open switch (B option), will switch from open to closed for set points above 0 PSID, but will switch from closed to open for set points below 0 PSID.

TROUBLE SHOOTING

A. Switch doesn't function

   i. Make sure that the switch load does not exceed the specified wattage rating of the switch. (steady-state and transient). Contact factory for assistance for excessive loads, otherwise proceed to the next step.
   ii. Perform a continuity check of the switch contacts by trying to actuate the switch using an external magnet. An operational switch usually indicates a problem with the gauge. If not operational proceed to the next step.
   iii. Verify the reed switch wires are connected to the terminal strip (NEMA 4X enclosure only). Contact the factory for assistance if the switch is connected and/or request an "RGA" number.

C. Gauge accuracy and set point problems:
   i. Verify gauge is not in an electromagnetic / magnetic environment. i.e.; close proximity to high current power lines.
   ii. All others, contact the factory for assistance.

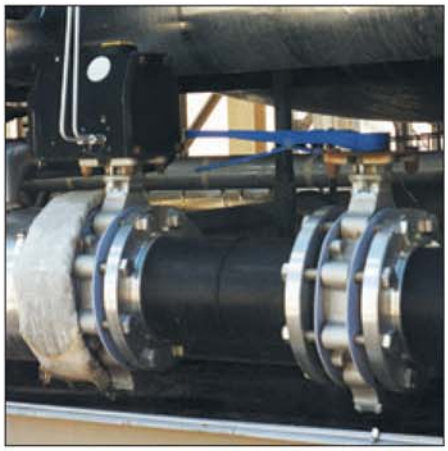
K-LOK® Figures 370/372 – ASME 300

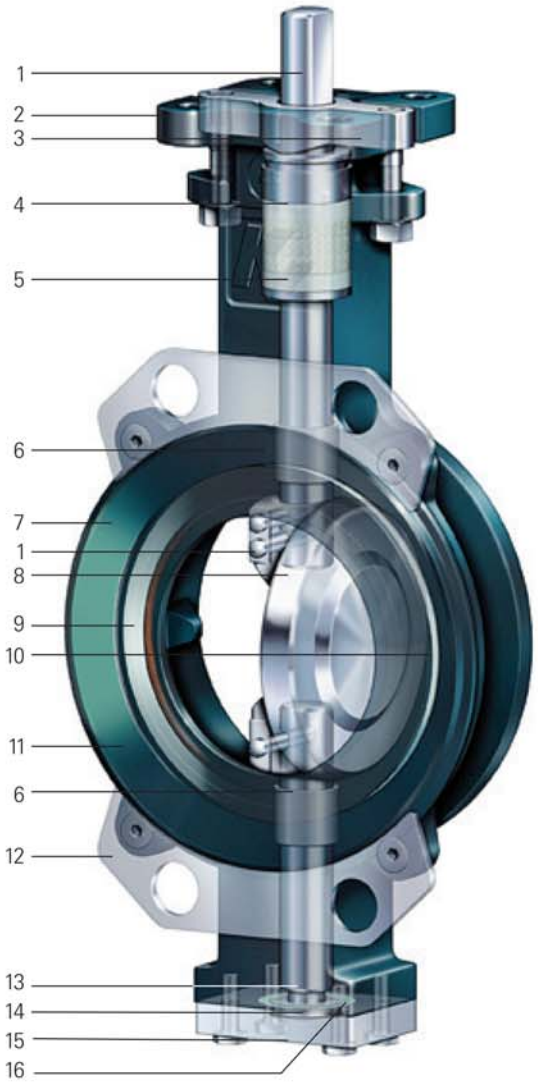


Features and benefits

- Integrally cast mounting pad provides direct mounting of many actuators.
- Rocker-shaped gland bridge compensates for uneven adjustment of gland nuts.
- Extended neck allows for two inches of pipeline insulation.
- Flattened body bore at shaft journal ports positions shaft bearings near disc, providing maximum shaft support.
- Disc taper pins are tangentially positioned half in disc and half in shaft, placing them in compression rather than shear, which eliminates potential for failure.
- Integrally cast disc position stop perfectly locates the disc in seat, achieving maximum seat and seal life.
- K-LOK polymer, elastomer, and fire-safe seats provide bi-directional, drop-tight closure in vacuum and throughout all pressure ranges, as well as at full rated differential pressure. A variety of materials allows optimum seat life in all applications.

General applications

- Airport refueling
- Hydrocarbon processing
- HVAC
- Chemical processing
- Purified gas
- Steam and vacuum services
- Potable water
- Food processing
- Sour gas
- Military
- Oxygen
- Pharmaceutical
- Ammonia
- Chlorine
- Reverse osmosis
- Category 'M' fluids
- Slurry
- Modulating control



Technical data

Size range:	NPS 2 to NPS 36
Pressure rating:	ASME 150 and 300
Temperature rating:	-20°F to 1000°F
Fire-safe option

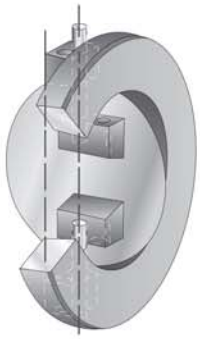
Principles of operation

Double offset disc/shaft

K-LOK®'s unique two-piece shaft and double-offset disc/shaft design allows for high cycling and creates a lower disc profile with increased capacity and a range of 33:1.

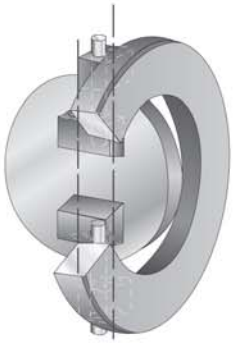
In addition to increasing the flow area across the disc, this design minimizes wear points between seat and disc.

The first offset is achieved by locating the shafts downstream of the center-line of the seat. This allows for a totally unobstructed 360° sealing surface.



The second offset locates the shafts off-center of the vertical axis of the seat.

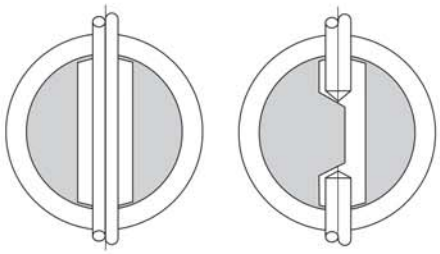
The combination of these two offsets creates a camming effect as the disc swings into and out of the seat. The disc lifts quickly out of the seat in the first few degrees of travel and does not contact the seat again until it is nearly closed. There are no wear points between the seat and disc, while operating torques are reduced and seat life is extended.



Double offset

First offset

Second offset

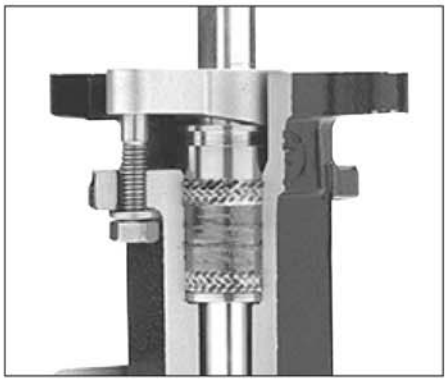


Two-piece shaft vs. one-piece shaft

K-LOK®'s disc geometry maximizes flow capacity by increasing the available flow area through the valve. This increase in disc efficiency results in a higher valve C_V.

Competitor
one-piece shaft

K-LOK®
two-piece shaft

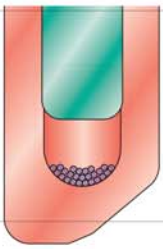


Aspect ratio = open area ÷ disc area

Fire-safe valve
API 607 4th edition approved by third party witness

The K-LOK® fire-safe design uses a stainless steel or alloy seat of convoluted shape that mates with an RTFE member. In the full-closed position, the K-LOK® provides continuous two-plane contact between the disc and both metal and RTFE seats. The fire-safe seat utilizes wire windings to provide the circumferential stiffness necessary to maintain interference between disc and seat.

Fire-safe seat



Fire-safe packing

K-LOK® fire-safe packing is composed of three rings of preformed graphite between one ring of woven graphite rope at the top and bottom.

This arrangement creates a superior, high temperature seal against the outer wall of the packing box and around the rotating shaft.

Seat materials

Seat	Material	Typical applications
1. RTFE	Reinforced polytetrafluoroethylene	HVAC, steam, chlorine, ammonia, nitrogen, water, gasoline, vacuum
2. PTFE	Polytetrafluoroethylene	Pharmaceuticals, air, potable water, dyes, white mediums
3. UHMWPE	Ultra high molecular weight polyethylene	Abrasives, suspended solids, scaling mediums
For seats 1 thru 3		
Wire wrap	Stainless steel braided wire	
Seat backing ring	Polyester or phenolic Stainless steel	General purpose services up to 200°F Steam, ammonia, elevated temperature services

Seat	Material	Typical applications
4. EPDM	–	Water based mediums, slurry applications, abrasives
5. NBR	–	Oil based mediums, slurry applications, abrasives
6. Fluoroelastomer (FKM)	–	Elevated temperatures, slurry applications, abrasives
For seats 4 thru 6		
Metal insert	Carbon steel	

Seat	Material	Typical applications
7. Metal	316 stainless steel or alloy (fash chrome coated)	High temperature, low temperature, abrasives, fly ash, slurries
8. Fire-safe	Reinforced polytetrafluoroethylene combined with 316 stainless steel (flash chrome coated)	Fire-safe installations, abrasives, slurries, steam
For seats 7 and 8		
Wire wrap	Stainless steel braided wire	

Seat design

The K-LOK® seat is a true interference seat design and does not rely on line pressure to assist in sealing. All seats seal drop-tight bi-directionally at low pressure as well as high pressure.

Polymer (PTFE, RTFE and UHMWPE) seats incorporate a stainless steel braided wire winding, enclosed in a U-shape envelope to provide seating energy and memory. This wire winding allows axial flexibility in both directions of flow. The winding also allows radial flexibility when the disc is not fully closed, reducing seat/disc interference, seat wear and shaft torque. When the disc closes, it provides circumferential stiffness and assures the required disc/seat seals tight.

Elastomer seats are molded around a stack of V-shaped steel rings that provide the same stability, support and flexure as the wire windings in polymer seats.

Metal seats employ a stainless steel or alloy ring of convoluted shape, reinforced by stainless steel wire windings. The thin, convoluted shape allows for expansion and contraction from thermal cycling. Long life is assured by flash coating the seat with chrome.

ASME/FCI 70-2 control valve seat leakage, tolerances, and test specifications

ASME B16.104-1976	Maximum leakage			Test medium	Pressure and temperature
Class VI	Nominal port diameter (NPS)	Bubbles per minute[3]	ml. per minute	Air or nitrogen	Service ΔP or 50 psig, whichever is lower, at 50°F to 125°F
	2	3	0.45		
	2½	4	0.60		
	3	6	0.90		
	4	11	1.70		
	6	27	4.00		
	8	45	6.75		
Class V	5 x 10^{-4} ml/min/psig/in. port dia.			Water	Service ΔP at 50°F to 125°F
Class IV	0.01% valve capacity at full travel			Air or water	Service ΔP or 50 psig, whichever is lower, at 50°F to 125°F

Notes:

1. K-LOK® polymer and elastomer seats meet or exceeds ASME Class VI shut-off.
2. K-LOK® metal seats and fire-safe seats (post fire exposure) meet or exceeds ASME Class IV shut-off.
3. Using the ASME/FCI specified calibrated measuring device.

Reference ASME/FCI 70-2 for further information.

Vacuum rating

The combination of interference fit seats and bi-directional packing makes the K-LOK® especially well suited for vacuum service.

Standard K-LOK® high performance valves are rated to an absolute pressure of 4 x 10^{-5} inch Hg. Higher vacuum applications are available.

Seating and un-seating torque

Seating and un-seating torques are a function of the size of the valve and the shutoff pressure of the system.

Specific torque ratings can be found in the seating/un-seating chart at the intersection of the 'size' row and the 'shutoff pressure' column.

Torques listed are for PTFE and RTFE seated valves. For different seat materials, specific multipliers are to be used as stated.

All torques listed are for normal service conditions (i.e. operating frequency is a minimum of once per month; disc corrosion is expected to be mild or minor, the media is a clean gas, liquid or steam, and is non-abrasive) and chemical effects upon the seat are minor.

PTFE and RTFE bi-directional seating and un-seating torque values

Valve size (NPS)	Shaft mounting code (ASME) 150	300	Seating and un-seating torque (lbs in) System shutoff pressure (psig) 150	200	285	400	500	740
2	BAB	BAB	220	280	380	460	520	580

36	MBE	EBD	52,500	58,500	70,000	-	-	-

*CAE and CAG mounting codes apply for shaft mounting of UHMWPE, metal and fire-safe seats.

Notes:

1. Torques are applicable only to PTFE and RTFE seats in noncorrosive or non-abrasive services such as water. For fire-safe and metal seats, select only the torque for the valve at 285 psig and multiply by 2.0.
2. For other seat materials, select the torque applicable for the maximum differential pressure and multiply by the following factor:

EPDM/NBR/Fluoroelastomer (FKM):	x 1.4
UHMWPE (clean service):	x 1.3

3. For corrosive, abrasive or other services than water, multiply by the following factor:

High solids slurry:	x 1.5
Dry gas:	x 2.0
Dry powders:	x 2.7
Liquids other than water:	x 1.2
Lubricating fluids:	x 0.8

   For services that combine unfriendly conditions such as extreme temperatures and high solids, or corrosive with high temperatures, contact your sales representative.

Extension brackets for various temperatures

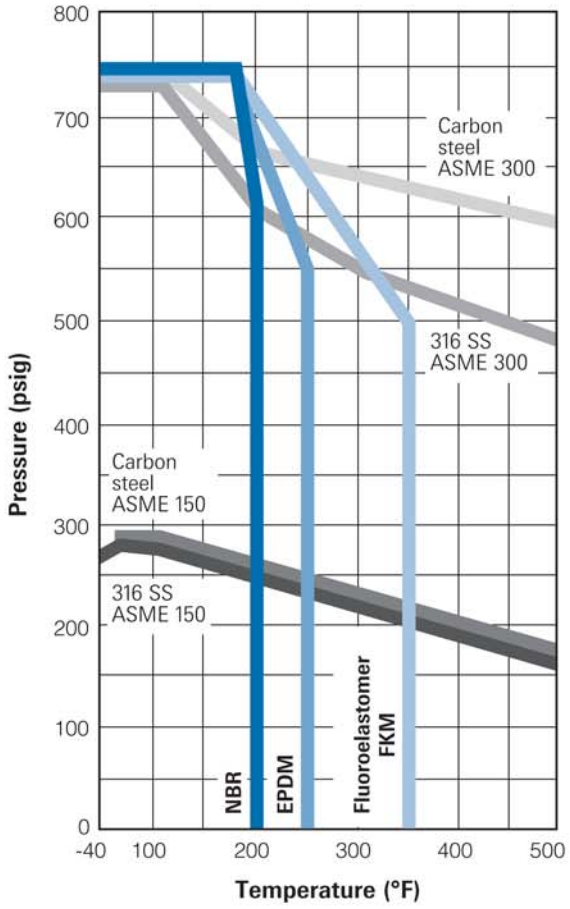
Pipeline fluid temperature	Required extension lengths (inches) Handle	Gear	Std. F79U/MRP	High temp. F79U/MRP	Standard F777
-100°F to 375°F	–	–	–	–	–
376°F to 460°F	4	–	–	–	4
461°F to 560°F	6	4	4	–	4
561°F to 650°F	6	4	4	–	4
651°F to 725°F	6	6	6	4	6
726°F to 825°F	8	8	8	6	8
826°F to 925°F	10	8	8	6	8
926°F to 1000°F	10	10	10	8	10

Notes:

1. Surrounding air temperature is assumed to be 70°F. For every degree over 100°F of the surrounding air, deduct 2 degrees from the maximum temperature ranges shown under the Pipeline fluid temperature column. (Example: 125°F external temperature reduces maximum temperature values under the Pipeline fluid temperature column to 325, 410, 510, 600, etc.)
2. Valves may be insulated or uninsulated.
3. Brackets may be open rectangular tubes or the standard closed Keystone tubular shaft extensions.
4. All actuators have a maximum service temperature (outside atmosphere). These temperature limitations apply regardless of K-LOK® extension lengths.

Flange gaskets

The K-LOK® high performance butterfly valve is designed to accommodate the use of standard, non-metallic gaskets for pipe flanges (such as compressed fiber, rubber, non-asbestos, flexible graphite, asbestos or equivalent gasket materials), meeting the dimensional requirements of ASME B16.21-1992. Metallic wound gaskets may also be used, however, please note that any valve with a bolted on retainer requires the wound gaskets material to be manufactured to the following dimensions (inches):



NPS	Outside diameter	Inside diameter
2	3 3/8	2 3/4
2 1/2	3 7/8	3 1/4
3	4 3/4	4
4	5	4 1/8

Common available trims

Figure number	Valve type
F360	ASME Class 150, Wafer
F362	ASME Class 150, Full-lug
F370	ASME Class 300, Wafer
F372	ASME Class 300, Full-lug

To order a K-LOK®, specify the valve size, the valve figure number (listed above) and the specific application trim code. The most common codes, together with the materials of construction, are listed below.
(Example: NPS 10 F360-104)

General purpose trims (up to 250°F)

Trim code	SAP code	Body	Disc	Shaft	Seat/backing ring	Packing	Bearing	Body gasket
106	CES6TSG	Steel	316 SS/ENP	17-4PH SS	UHMWPE/SS	Teflon®	SS-nitrided	Graphite
107	SES6TSG	316 SS	316 SS/ENP	17-4PH SS	UHMWPE/SS	Teflon®	SS-nitrided	Graphite

General purpose trims (up to 500°F)

Trim code	SAP code	Body	Disc	Shaft	Seat/backing ring	Packing	Bearing	Body gasket
123	CES1TSG	Steel	316 SS/ENP	17-4PH SS	RTFE/SS	Teflon®	SS-nitrided	Graphite
124	SES1TSG	316 SS	316 SS/ENP	17-4PH SS	RTFE/SS	Teflon®	SS-nitrided	Graphite
158	CSS1TSG	Steel	316 SS	17-4PH SS	RTFE/SS	Teflon®	SS-nitrided	Graphite
159	SSS1TSG	316 SS	316 SS	17-4PH SS	RTFE/SS	Teflon®	SS-nitrided	Graphite

Metal seated – high temperature trims

Trim code	SAP code	Body	Disc	Shaft	Seat/backing ring	Packing	Bearing	Body gasket

VALVES & CONTROLS

K-LOK® Installation, Operation, Maintenance and Troubleshooting

General

Suggested installation orientation is with valve shaft horizontal or inclined from vertical. Unless otherwise recommended by Pentair Valves & Controls, mount the valve in the preferred direction with the directional arrow pointing to the lower pressure side so that the front face of the disc will be upstream when the valve is in the closed position.

Thermal insulation of the body is mandatory for operating temperatures above 392°F [200°C].

K-LOK offers the following body styles:
Wafer – Figures 360 and 370.
Lug/Single Flange – Figures 362 and 372

Inspection

1. Carefully remove the valve from the shipping package (box or pallet) to avoid any damage to the valve and, in the case of automated valves, to the electric or pneumatic/hydraulic actuator or instrumentation.
2. Prior to installation, clean the inside of the valve. Insure that there are no solid objects such as pieces of wood, plastic or packing materials within the valve or on the valve seat.
3. Inspect the seat and disc edge to insure that they were not damaged in handling. This is especially important in the case of valves with “fail-open” actuators.
4. Confirm that the materials of construction listed on the valve nameplate are appropriate for the service intended and are as specified.
5. Locate the directional arrow on the body that defines the preferred mounting orientation in respect to the pressure. In most cases, the valve is properly installed when the actual fluid flow or high pressure is acting on the front face of the disc when the valve is closed.
6. Ensure that the packing gland bolting nuts are tight.

CAUTION
The valve should be installed in the closed position to insure that the seat and disc are not damaged during installation. Particular care should be taken with valves equipped with “fail open” actuators. Failure to insure proper handling may result in damage to the valve. If the pipe is lined, confirm that the disc rotation does not contact the lining during the opening stroke. Failure to confirm that the disc rotation does not contact the lining may result in damage to the valve.

IMPORTANT
Whenever possible, install the valve with the shaft in the horizontal position and, if possible, with the cast-in disc stop located top-side of the pipe. If the shaft cannot be positioned horizontally, position the shaft so that it is not on the vertical centerline in a horizontal pipe run. This will minimize any depositing of solid particles present in the fluid into the lower bearing.

Copyright © 2013 Pentair. All rights reserved.

Installation

The valves are shipped with flange gasket surface protection. Before installing the valve, remove the protection and carefully clean and degrease both surfaces with a solvent.

Lug Series – Figure 362 and 372

1. Orient the valve with the directional flow arrow (preferred direction) pointing in the proper direction.
2. Insert the valve between the flanges until the two bottom holes in the valve align with the two lower flange holes.
3. Insert a bolt or stud through the flange and thread it into the holes in the valve body. This will allow the valve to center itself properly for the installation of the flange gaskets.
4. Install the flange gaskets and the remaining flange bolting.
5. Use the crossover method to tighten all flange bolting.

Wafer Series — Figure 360 and 370

1. Orient the valve with the directional flow arrow (preferred direction) pointing in the proper direction.
2. Insert the valve between the flanges until the alignment holes at either side of the valve match the corresponding holes in the flanges.
3. Insert a long bolt or stud through the flange and thread it through the alignment hole. This will allow the valve to center itself properly for the installation of the flange gaskets.
4. Install the flange gaskets and the remaining flange bolting.
5. Remove the long bolts/studs from the lower alignment holes and replace with correctly-sized bolts.
6. Using the crossover method, tighten all flange bolts.

Valve Checkout

1. Tighten the packing gland bolting just enough to prevent stem leakage. Over-tightening will decrease packing life and increase operating torque requirements.
2. Check the operation of the valve by stroking it to “full open” and “full close.” To determine the valve orientation of the disc, double D’s and keyways are aligned with the disc. The valve disc travels clockwise to close.
3. For automated valves, set the air pressure/electrical voltage for at least the minimum given to operate the actuator. For pneumatic actuators, do not apply more than 1.25 times the pressure for which the actuator was designed.

Note: for spring return actuators with positioners, overpressure will cause excessive time delay in the spring movement for the valve disc to travel out of the seat.

Operation

The K-LOK has been designed to require a minimum of maintenance. Generally, only maintenance on the packing box is required.

Maintenance

If shaft leakage is observed through the packing box, tighten the gland nuts.

Note: do not over-tighten packing box gland nuts. Over-tightening will increase the torque required to operate the valve. When tightening the gland nuts, use half-turn increments until leakage has stopped.

Disassembly

To begin disassembly, refer to the parts list (Figure 2) and proceed as follows:

Warning
Depressurize the valve and associated piping before disassembly. Failure to do so may cause serious personal injury and/or equipment damage.

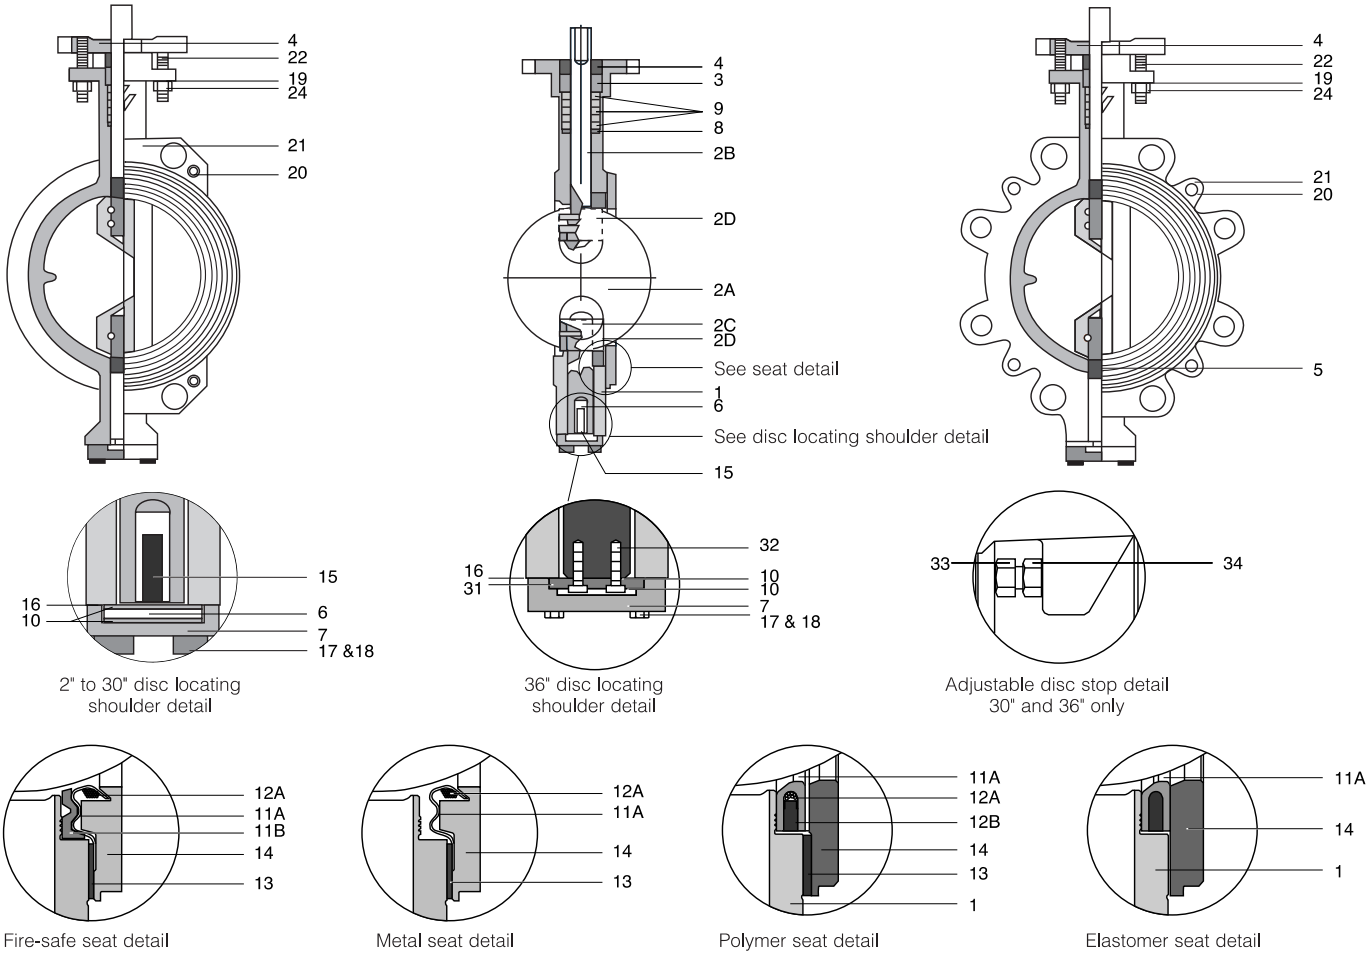
1. Remove the valve from the line. Clean the valve according to proper cleaning procedures as outlined by the plant or according to a prescribed procedure.
2. Remove the actuator and relevant connecting key. Note the actuator position relative to the valve.

Caution
Throughout disassembly and assembly, always use cardboard or brass shims to protect the valve body, disc, flange and sealing surfaces from damage. Failure to do so may result in serious damage to the valve.

Removing the Disc-to-stem Tapered Pin Connections

1. Open the valve disc (2A) to its full open position.

Note: on valve sizes 10" and larger, it is recommended that two workers perform the disc tapered pin (2D) removal process.



2. Place the disc in a vise.
3. Using a tool steel punch, locate the punch on the small end of the disc taper pin (2D) and then strike the punch with a heavy hammer. (See Figure 1.)

Figure 1 - shows the valve properly clamped in place

Copyright © 2013 Pentair. All rights reserved.

Figure 2

Parts List

1.	Body	11A.	Seat	22.	Packing gland bridge stud
2A.	Disc	11B.	Fire-safe seat insert	23.	Key (8" to 36") (not shown)
2B.	Upper stem	12A.	Seat wire wrap	24.	Hex nut
2C.	Lower stem	12B.	Seat backing ring	25.	I.D. tag (not shown)
2D.	Taper pin, disc	13.	Seat retaining gasket	26.	Flow tag (not shown)
3.	Gland	14.	Seat retaining ring	27.	Strap tag (not shown)
4.	Gland bridge	15.	Taper pin shoulder (2" to 30")	28.	Strap tag (not shown)
5.	Bushing	16.	Gasket bottom cover	29.	Spacer (30" only)
6.	Disc locating shoulder (2" to 30")	17.	Hex head cap screw	30.	Screws (30 & 36") (not shown)
7.	Bottom cover	18.	Lock washer (ext. tooth)	31.	Thrust plate (36" only)
8.	Packing ring, anti-ext.	19.	Lock washer (spring)	32.	Screws (36" only)
9.	Packing set	20.	Hex soc. flat head screw	33.	Screw (30" & 36")
10.	Thrust washer	21.	Clip or locating plate	34.	Nut (30" & 36")

Copyright © 2013 Pentair. All rights reserved.

Note: some of the weld on the three disc taper pins (2D) may need to be removed by grinding.

Warning
When placing the valve into the bench vise, make sure the small end of the disc (2A) taper pin faces the assembler.

Hold the punch with a punch holder or a pair of vise grips. Otherwise, serious injury may occur.

Removing the Bottom Cover Assembly

To disassemble the bottom cover assembly, remove the following bottom cover assembly components:

- bottom cover plate (7)
- thrust washer (10)
- bottom cover gasket (16)
- washer (18)
- screw (17)

Removing the Lower Stem Assembly

Caution
Throughout this operation, make sure the disc edges remain protected from contact with the body by installing cardboard at all disc hub areas. Failure to do so may cause damage to the disc sealing edge.

1. Spray penetrating oil into the disc hub where it meets the stem connection.
2. Locate a wedge-shaped chisel/punch between the disc locating shoulder (6) position and the body (1) bottom surface. (See Figure 3.)
3. Strike the chisel/punch to force the disc locating shoulder (6) away from the valve body (1) surface.
4. Continue to wedge apart the lower stem assembly, via the disc locating shoulder (6), until the lower stem (2C) is free of the disc (2A).
5. Lightly strike the backside of the disc hub area with a hammer if the stem is resistant to removal.

Removing the Packing Gland Assembly

1. Unthread the nuts (24) from the packing bridge studs (22).
2. Remove the packing gland bridge (4).

Removing the Upper Stem and Disc

Caution
Throughout this operation, make sure the disc edges remain protected from contact with the body by installing cardboard at all disc hub areas. Failure to do so may cause damage to the disc sealing edge. Protect the stem from the vise teeth to prevent damage and to eliminate potential for packing leakage

1. When removing the upper stem (2B) from the disc (2A), clamp the vise jaws on to the upper stem (2B) area above the valve body top plate.
2. Once the vise jaws are secure against the upper stem (2B), drive the wedge-shaped chisel/punch between the valve body (1) top plate and the bench vise. (See Figure 4.)
3. As the valve body (1) moves away from the bench vise, the upper stem (2B) is removed from the upper disc (2A) hub.
4. Continue to reposition the valve body (1) with the bench vise so as to allow removal of upper stem (2B).

Caution
Physically hold the disc to prevent the disc from falling and becoming damaged during removal. When both the upper stem (2B) and lower stem (2C) are removed from the disc (2A), the disc is unsupported.

Warning
Smaller discs may be removed by hand (2" to 8"). Remove larger discs with proper hoisting equipment. Failure to do so may result in personal injury or damage to equipment.

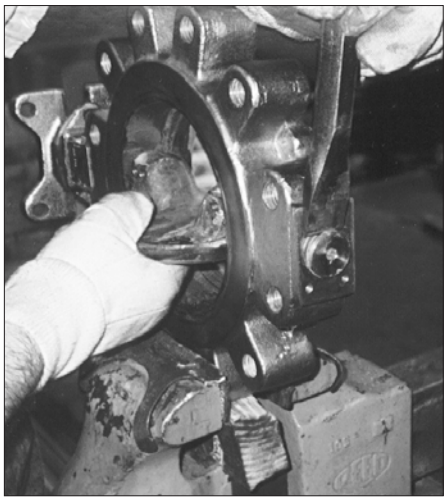


Figure 3 – Shows the proper placement of the disc locating shoulder and the body bottom surface.

Figure 4 – Shows how the upper stem is removed from the upper disk hub.

Copyright © 2013 Pentair. All rights reserved.

Removing the Seat Retainer Ring

Remove the seat retainer ring (14) by removing the hex socket screws (20) or seat retainer screws (30) and the clips (21) for lugged body, or the locating plates (21) for the wafer body. (See Figure 5.)

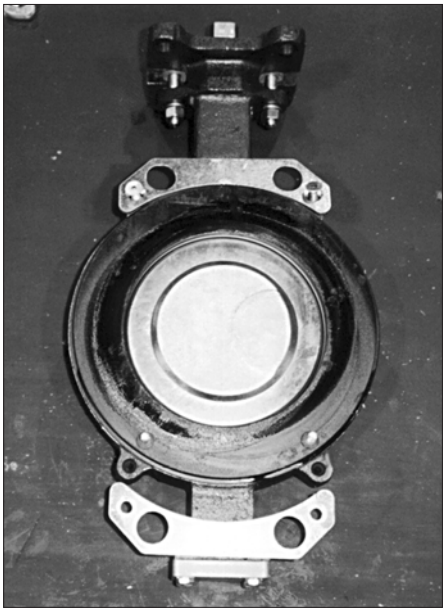

Figure 5 – Seat retainer ring and parts.

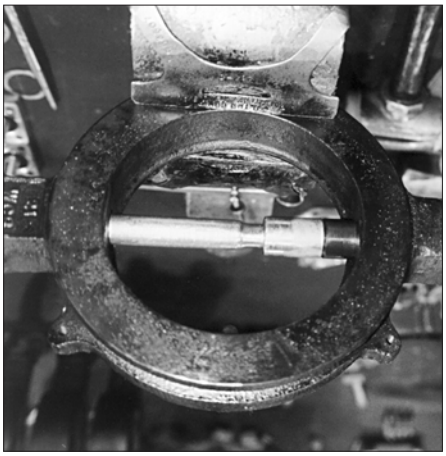

Figure 6 – Shows partial insertion of the stem bearing.

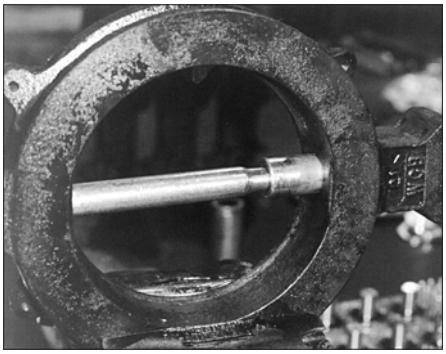

Figure 7 - Shows the stem bushing flush with the flow path surface.

Removing the Seat Retainer Gasket

Remove the seat retainer gasket (13). Use a powered wire brush tool to remove the gasket material that may have adhered to the mating body surfaces.

Removing the Seat Assembly

To remove the seat assembly, treat the seat (11) and its associated components as a single assembly by removing the following:

- seat (11)
- wire wrap (12A)
- seat backing ring (12B)

Removing the Packing Assembly Method 1: for Packing Replacement with Stem in Body

1. Using the screws, grab and remove each packing ring, one at a time.

Method 2: packing Removal with Stem Removed from Body

Note: to remove the packing set (9) with the upper stem (2B) still in the valve body (1), two long, slender screws are required. The screws must not have a diameter greater than 1/4" and must be at least six inches long. The most commonly used screws are "drywall screws."

1. To remove the packing set (9) with the upper stem removed, use a hook-type tool to pull out one packing ring at a time.

Removing the Stem Bushings

1. Insert the removal tool in the valve body (1) top plate area and down the upper stem journal until the tool

Note: a special bushing removal/installation tool is required to remove or install the stem bushings (5). The tool O.D. dimension should be as near in size as the valve stem bore I.D. dimension and have a Class 3 fit. Any Machinist Handbook can provide Class 3 tolerances.

contacts the upper stem bushing.

2. Remove the upper stem bushing (5) by striking the tool with a hammer.
3. Insert the removal tool in the valve body (1) bottom plate area and down the lower stem journal until the tool contacts the lower stem bushing.
4. Strike the tool until the lower stem bushing (5) is clear of the lower body stem journal.

Inspecting the Valve Components

1. After disassembly, visually inspect the seat retainer ring (14) and the bottom cover plate (7).
2. Make sure all body sealing surfaces:
   - are flat
   - are free of corrosion damage
   - have a smooth surface
   - are free of burrs.

Remove any burrs with fine grit sandpaper.

3. Inspect for scratches around disc edges:
   - If scratched, smooth the edge with fine grit sandpaper (220/400 wet/dry sandpaper)
   - Remove the scratch by using a blending motion and extend the smoothed area at least two inches above, below and around the original scratch
   - To polish the disc edge, use a powered wire brush
   - Finish sand or polish the edge on a lathe, as required.
4. Check to see that the upper and lower (2B, 2C) stem-to-bushing (5) contact locations are free of galling.
5. Check to see that the upper (2B) stem-to-packing (9) contact area is free of scratches.

Assembly

Note: if scratched or galled, these surfaces should be polished or replaced

Installing Stem Bushing

1. To avoid damaging the stem bushing (5), gently press the bushing into the stem body journal by lightly striking the bushing (5) with a rubber mallet.
2. Once the stem bushing (5) has been partially inserted into the valve body journal, insert the installation/removal tool against the upper stem bushing. (See Figure 6.)
3. Strike the tool with a hammer to continue inserting the stem bushing until it is flush with the body flowpath surface. (See Figure 7.)

Copyright © 2013 Pentair. All rights reserved.

Installing the Disc/Stem Assembly

> ***Caution***
> To prevent damage to the disc, do not allow the disc edges to contact the body flowpath surface.

1. Install the upper stem (2B) and lower stem (2C) into the valve body stem journals with the pinning grooves position on top of the stem side view.

Note: the upper and lower stems are correctly installed when the lower ends of the stems are flush with the body flowpath surface.

2. While holding the disc (2A) with the backside of the disc facing up and the double pin hub facing toward the body (1) upper stem journal, position the disc (2A) in the body (1).
3. Push the stems (2B and 2C) into the disc (2A) hub stem holes.
4. If required, rotate the stems until the stem tapered pin holes are in alignment with the disc (2A) hub tapered pin holes.
5. Manually push the disc tapered pins (2D) to install them through the disc hub tapered pin holes.
6. Install the packing set (see Installing The Packing Set).
7. Carefully drive the tapered pins (2D) firmly into the connection with a punch and hammer.

Note: original disc/stem assemblies may use the disc locating shoulder assembly (6,10 and 15) installed with the lower stem (2C). In this case, the disc/stem assembly should already be centered and may not require any centering adjustment.

Installing the Packing Set

1. Install the anti-extrusion packing ring (8), packing set (9) and packing gland (3) into the upper journal of the valve body (1).
2. Keeping the disc assembly (2) in the closed position and closely centered in the body bore, tighten the packing nuts (24). Nuts have been correctly tightened when the packing gland plate (4) is flush with the valve body (1) top plate.

Installing the Disc Locating Shoulder Assembly

1. Place a thrust washer (10) over the disc locating shoulder (6) neck. If the thrust washer (10) has PTFE fabric on one side, install the thrust washer with the PTFE fabric side in contact with the disc locating shoulder.
2. Making sure the disc (2A) is in the closed position, center the disc with the body seat pocket.
3. Measure the gap between the body seat pocket ID and the disc OD before locking the disc into position. These measurements are to be made at the disc hub sections. The gap measurements are to be within 0.020 inches of each other. (See Figure 8.)
4. While keeping the disc centered, drive the disc locating shoulder (6) into the bottom hole of the lower stem (2C) until the disc locating shoulder (6) and the associated thrust washer (10) are pressing against the body (1) bottom surface.
5. Push the tapered pin (15) into the hole located in the bottom of the disc locating shoulder (6).
6. Lock the tapered pin (15) into position by driving it with a punch and hammer. (See Figure 9.)

Installing the Bottom Cover Assembly

1. Place the bottom cover gasket (16) around the disc locating shoulder (6).
2. Place a thrust washer (10) in the bottom cover plate (7). If the thrust washer (10) has PTFE fabric on one side, install the thrust washer with the PTFE fabric facing out from the bottom cover plate (7).
3. Align the bottom cover plate (7) with the body (1) bottom surface, making sure the bottom cover gasket (16) remains in alignment with the bottom cover plate (7) gasket groove.
4. Tighten the four bolts and washers (17, 18).

Installing the Standard Seat Assembly

1. Check to make sure the disc (2A) is in the closed position.
2. Make sure the disc is centered in relation to the body seat pocket.

Installing the Standard Seat Assembly

1. Check to make sure the disc (2A) is in the closed position.
2. Make sure the disc is centered in relation to the body seat pocket.
3. Reset the disc locating shoulder pin (15) into its correct locked position by using a hammer and punch.
4. Put the seat retainer gasket (13) on the valve body (1) gasket surface. (See Figure 10.)

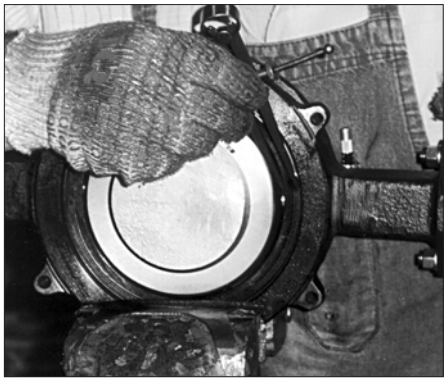

Figure 8 – Shows how to measure the gap between the body seat pocket ID and the disc OD

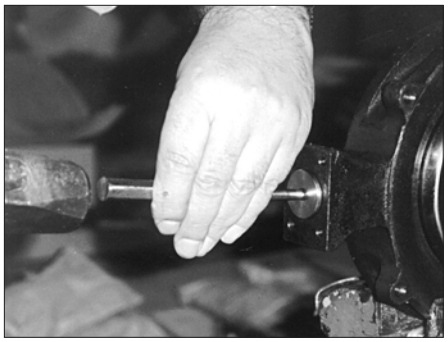

Figure 9 – Shows how to lock the tapered pin into position.

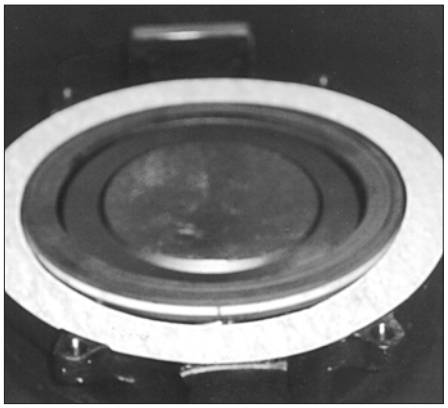

Figure 10 – Shows proper placement of seat retainer gasket.

Copyright © 2013 Pentair. All rights reserved.

5. Install the seat assembly.6. Insure the disc (2A) is closed against the body (1) disc stop.

Note: elastomer seated trims do not require a seat retainer gasket (13).

6. Insure the disc (2A) is closed against the body (1) disc stop.
7. Place the seat retainer ring (14) on top of the seat retainer gasket (13) and seat assembly (11 and 12).
8. Place the locating plates (21) and/or clips (28 for wafer style; 21 for lug) on the valve body.
9. Install and tighten the screws (20 or 30).

Caution
The standard seat retainer screws provide only enough force to hold the seat retainer ring (14) for shipment and installation. If valve actuation is required before installation, press the seat retainer into the seat to prevent damage to the valve seat before actuation.

10. Press the seat retainer ring into the seat (11 and 12) and body (1) using two C-clamps to provide the needed compressive load. To press the seat retainer ring with the C-clamps, place the C-clamps on the valve assembly to allow an even load to be applied all around the seat retainer ring (14) and tighten until the seat retainer gasket (13) is compressed.
11. With the C-clamps pressing the seat retainer ring (14) into the gasket (11). Tighten the screws (20 or 30).

To install RTFE, PTFE and UHMWPE Seats:

1. Place the seat backing ring (12B) into the seat (11).
2. Press the backing ring into the seat (11) until no gaps are present between the backing splits.
3. Rotate the seat assembly until the seat backing ring (12B) splits align with the body stem journals.
4. Place the seat assembly (11 and 12) into the valve body (1) seat pocket. The seat assembly is correctly placed when the “V” groove on the side of the seat (11) is facing toward the assembler.

To install NBR, EPDM and Fluoroelastomer (FKM) seats:

1. Place the seat assembly (11) into the valve body (1) seat pocket.
2. Make sure the taper on the seat (11) ID is facing down toward the disc (2A) sealing surface.

To install Fire-safe Seats:

1. Place the RTFE seat insert (11A) into the grooves of the metal seat.
2. Place the seat assembly (11 and 12A) into the valve body (1) seat pocket.
3. Make sure the RTFE seat insert (11A) is facing down toward the disc (2A) sealing surface.

To install Metal Seats:

1. Place seat assembly (11 and 12A) into the valve body (1) seat pocket.

Installing Bi-directional Dead-end Service Polymer Seat Assembly

Additional steps are required before seat installation for RTFE, PTFE and UHMWPE polymer seats used in bi-directional dead-end service. (See Figure 11.) Before installing these types of seats, follow these steps:

1. If the valve requires an O-ring, place the O-ring in the seat pocket. Place a 1/4" diameter bead of CANNING™ Marston Hylomar Gasket and Joint Compound, (Type PL32 Heavy Sealant) or equivalent around the seat pocket ID corner.

Caution
Do not use any gasket sealant in valves being prepared for oxygen, chlorine or silicone-free service. Use of gasket sealant in such applications will result in damage to the valve.

2. Install the seat assembly.
3. To allow the seat retainer ring dead-end service bolts to pass through the gasket (13), modify the seat retainer ring gasket (13) by following these steps:
   a. Use the dead-end service seat retainer ring (14) to layout the bolt hole pattern.
   b. Using a hole punch, make the required holes in the gasket.

Caution
To prevent damage to the valve when clamping, protect the body flange surfaces from the vise clamping surfaces with cardboard or brass shims

TIG Welding of the Disc Taper Pins

1. After assembling and testing the valve, lock the three disc/stem taper pins (2D) by forcefully driving the tapered pins in place with a hammer and steel punch.
2. TIG weld the disc taper pins (2D). Weld using filler rod referenced in Table I.

Note: Sizes 14" to 24" body valves employ both clips (28 for wafer and 21 for lug) and locating plates (21) to retain the seat retainer ring (14). Size 30" and 36" wafer and lug body valves use seat retainer screws (30) instead of the hex socket flat head screws (20) with clips or locating plates. These seat retainer screws are located directly in the face of the seat. Two of these seat retainer screw holes are tapped. The two tapped holes allow the use of eye bolts so the seat retainer ring can be lifted to and from the body (1).

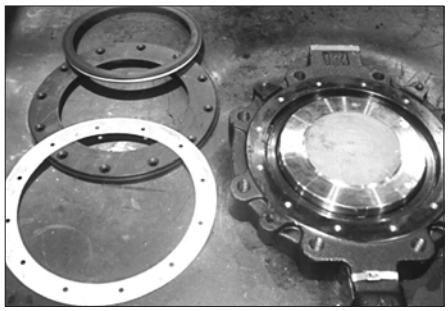

Figure 11 – Shows dead-end service seat assembly.

Table I

Stem and Pin Material	Filler Rod
17-4 pH 1075 HT	312 Stainless Steel
17-4 Ph 1160 DHT (NACE)	312 Stainless Steel
316 Stainless Steel Condition B	312 Stainless Steel
K Monel 500®	Monel®
Inconel®	Inconel

Symptom	Possible cause	Resolution
Valve won't rotate	1. Actuator has failed 2. Valve packed with debris 3. Stem key has sheared	1. Repair or replace 2. Flush or clean valve to remove debris 3. Determine cause of shearing and correct, replace
Stem packing leaking	1. Gland flange bolting loose 2. Packing damaged	1. Tighten gland flange bolting 2. Depressurize valve and replace packing
Bottom cover gasket leaking	1. Bottom cover bolting loose 2. Gasket damage	1. Tighten bottom cover bolting 2. Remove valve from service and replace gasket
Valve leaking	1. Valve not fully closed 2. Debris trapped in valve 3. Seat or disc edge damaged 4. Actuator mechanical closure stop incorrect	1. Close valve 2. Cycle and flush to remove debris 3. Remove valve from service and replace seat and/or repair or replace disc 4. Adjust the stop to allow further closure
Jerky operation	1. Stem/bearing damaged 2. Actuator/stem adapter misaligned 3. Overtightened packing 4. Air supply inadequate	1. Disassemble valve and inspect for damage, repair or replace damaged parts, reassemble 2. Remove actuator mounting and realign 3. Loosen packing to hand tight, cycle valve, retighten 4. Increase air supply pressure

PENTAIR

MORIN

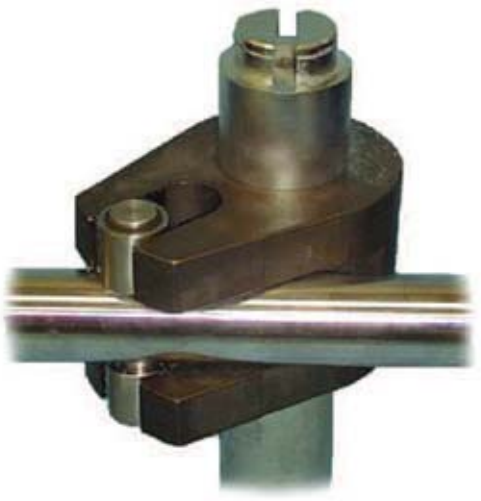
B series - Ductile iron w/ stainless steel cylinders
C series - Ductile iron w/ carbon steel cylinders
Spring return and double acting actuators
Quarter-turn output torques to 1,400,000 lb.in.

Features and benefits

- Ductile iron housing, piston and end caps provide long product life with durable, cost effective operation.
- Output shaft made of high strength alloy steel or 17-4PH stainless transmits torque without fatigue.
- Sintered bronze bushings or PTFE composite on output shaft eliminate side loading of valve stem to maximize stem packing performance.
- Chrome-plated steel piston rod provides strength and corrosion resistance for enduring high cycle applications.
- Sintered bronze piston rod bushings provide low-friction support and precise alignment of the piston rod to increase efficiency. reduce maintenance and extend actuator life.
- Heat-treated stainless steel thrust pin and rollers transfer piston force to 17-4PH stainless steel or ductile iron yoke by rolling to reduce friction. for longer life and more efficient torque transmission.
- PTFE guide bands ensure low-friction piston guidance during operation to protect cylinder walls from potential scoring and extend seal performance with a continuous cylinder wiping action.
- Bi-directional travel stops provide accurate valve rotation adjustment.
- ISO 5211 mounting pattern promotes easier valve adaptation by utilizing internationally recognized standards.
- Both series B and C have been certified to SIL 3 ratings.
- Actuators are rated IP66.

Series B

Series C



- NAMUR drive slot on output shaft enables accessory-driven components to maintain a compact assembly and eliminates the need for couplings.
- Tectyl-coated springs can be disarmed without special tools to safely and easily disassemble the actuator in the field. reducing down time and providing a 'man safe' spring.
- Easily removable housng cover provides effortless access for internal inspection of yoke mechanism.

Technical data

Supply pressure	: 40 to 160 psig (see torque chart. MORMC-0333)
Supply medium	: Air or any gas compatible with materials of construction
Temperature rating	
Standard range	: -20°F to 210°F
Optional range	: -65°F to 300°F
Angular rotation	: 90 degrees ± 8 degrees

Morin has a rugged heart

Morin scotch yoke

The heart of any scotch yoke actuator is the yoke. Morin uses either 17-4PH or ductile iron for this critical area as standard.

The yoke is the mechanism used to convert linear force to torque. The yoke is critical to actuator performance. It must be rugged, yet precisely machined to give long life at high efficiency. Morin understands this and ensures that all our yoke designs meet this test.

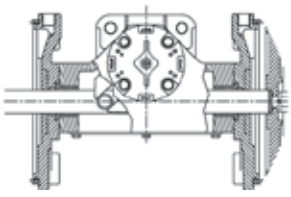
Principles of construction

Using high quality materials of construction and modern rugged design concepts Morin becomes the standard for low cost valve actuation while providing high quality performance.

The actuator housings are all machined from ductile iron castings. This produces a rugged, low cost product through reduced machining time and by eliminating wasteful excess material.

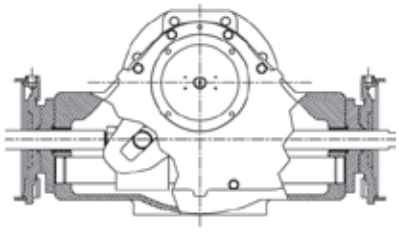
Any components that rotate or slide during operation, such as the high strength output shaft, chrome-plated piston rod, stainless steel thrust pin or the ductile iron piston, are all supported by replaceable friction reducing bearings.

Bi-directional travel stops



Adjustable stops on each end cap provide the flexibility of accurate valve rotation positioning at the end of the 'open' and 'close' stroke. Both stops are located on the cylinder centerline, the optimal position to maximize travel adjustment and eliminate any detrimental side loading on the travel stops. Adjustable from 82° to 98°.

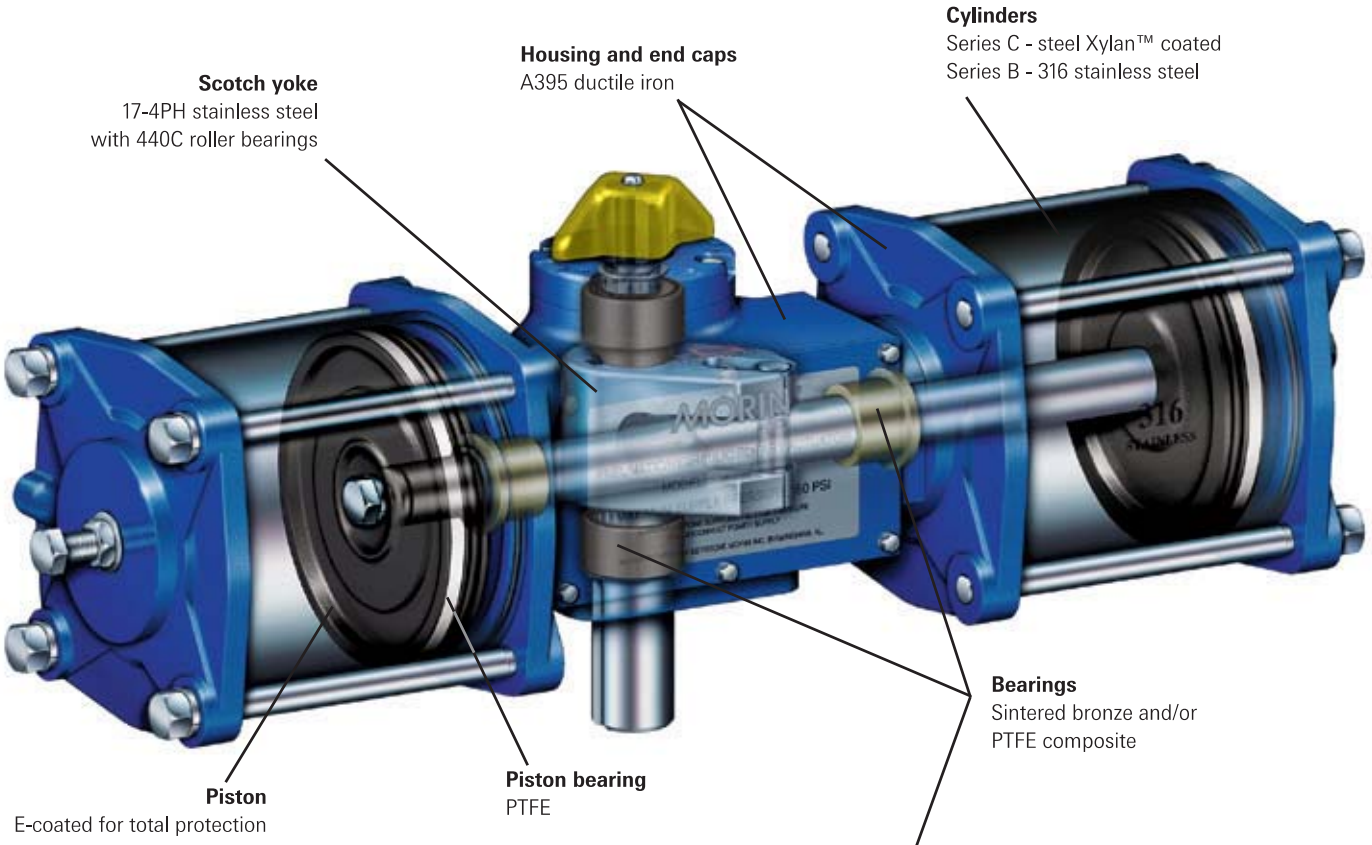
Spring designed for safety



All spring return models incorporate a 'man safe' spring design that allows the actuator to be safely assembled and disassembled in the field without the need for special tools. The integral tie rods are bored and tapped to provide a means of loading and unloading the spring in a safe and convenient manner.

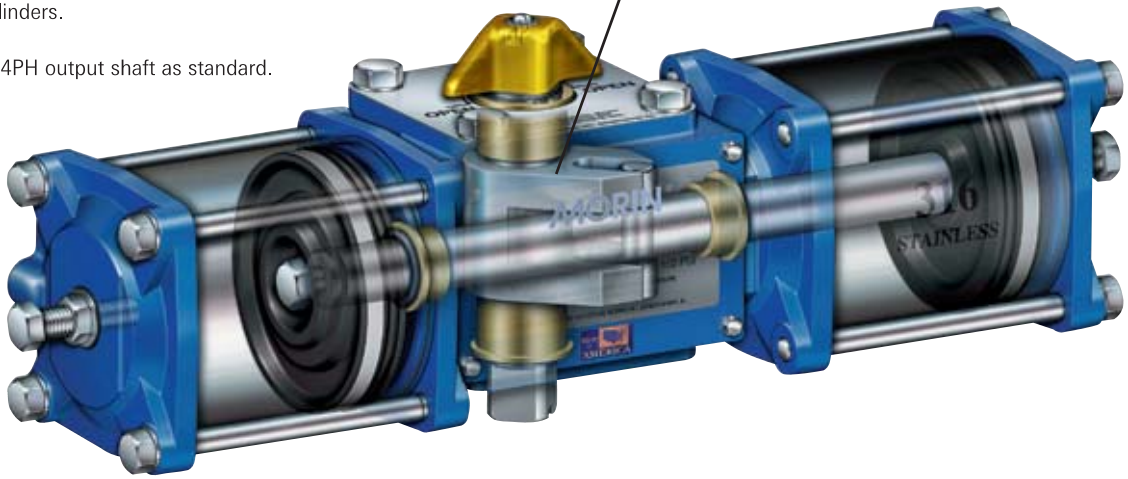
Morin understands actuator design

Morin understands that the most efficient design for one torque range is not the most efficient for another. Morin uses the standard scotch yoke design for lower torque ranges and a guide bar design for the higher torque ranges. This gives a rugged design with economic cost.



Standard design, scotch yoke

Guide bar design, scotch yoke

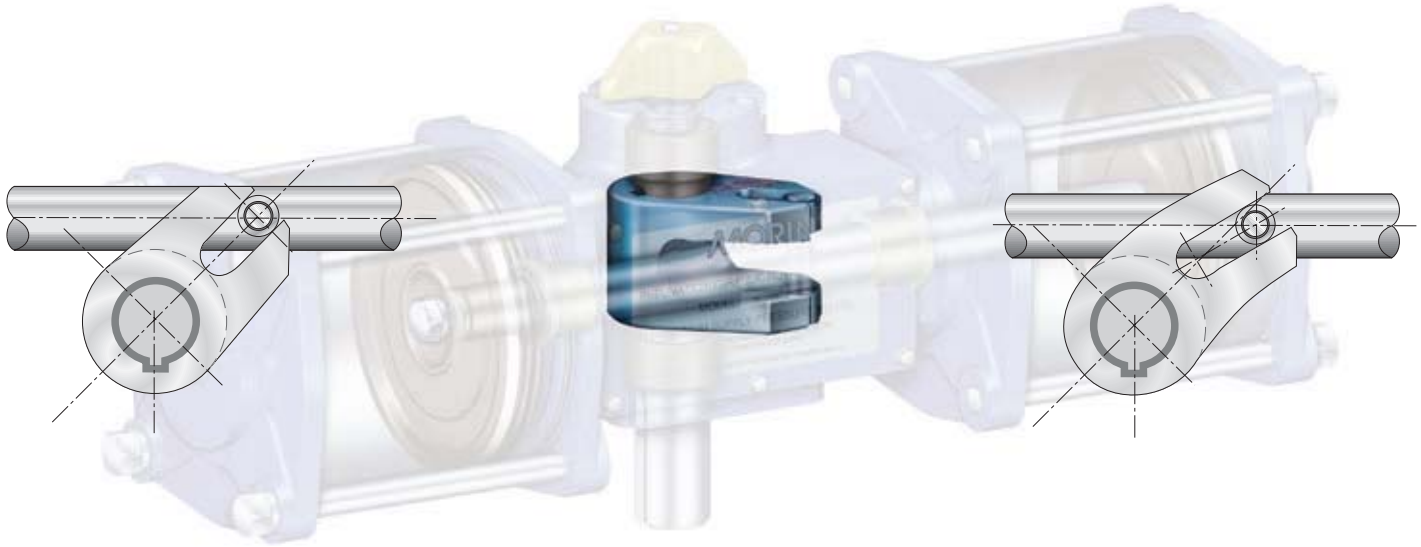


Superior materials of construction offer long life, and mean less downtime
Series B or C, models 135 to 1150

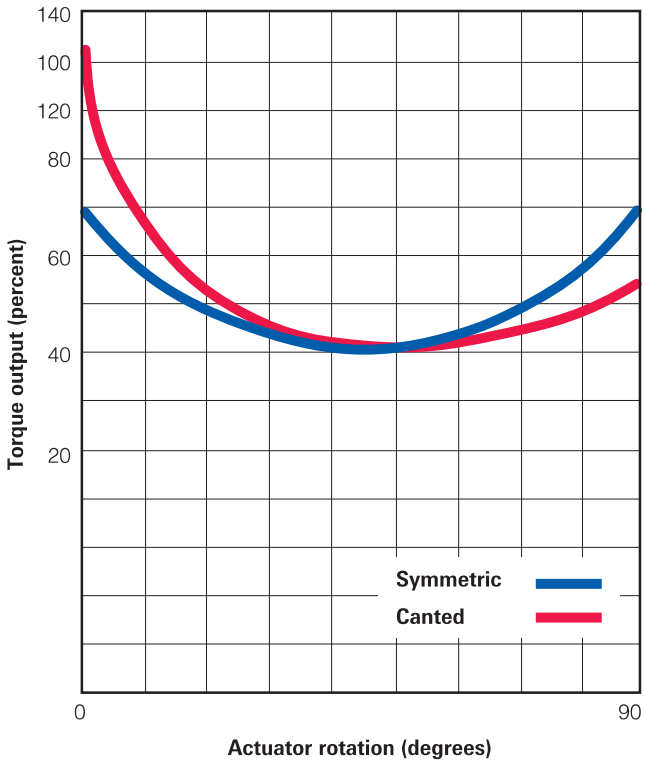
Series B, models 006 to 100

Morin series B uses construction identical to the series C, but with 316 stainless steel cylinders.

Models 006 to 100 use 17-4PH output shaft as standard.



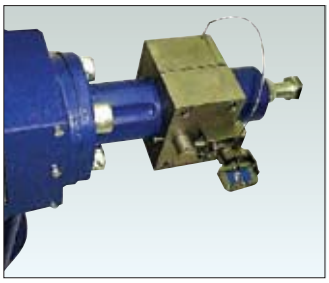
Note



See Morin series B/C/S IOM for a complete bill of materials.

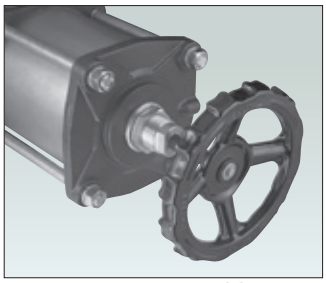
Symmetrical and canted yokes
It's about fitting the torque curve of the actuator to the valve . . .
It's about lower cost, lighter weight, smaller actuators . . .
It's about CHOICE . . .

Symmetric
Symmetrical yoke design offers the standard torque curve seen most often in relation to scotch yoke actuators. It offers the increased torque advantage at both ends of the 90° stroke as shown on the blue curve below. This torque curve covers most quarter-turn applications.



Canted
Canted yoke design moves the torque curve to where it's needed most, gaining as much as 35% more break and reseat torque for the same size actuator. The canted yoke curve is shown in red below. Canted yoke actuators allow selection of smaller, lighter, and less expensive actuator packages.

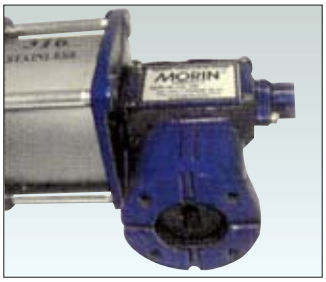
Options



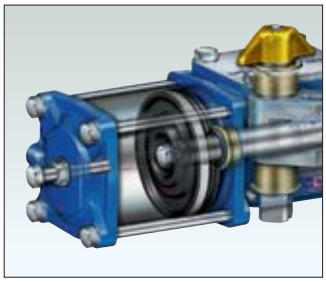
To provide the actuation package best suited for your application, the Morin line offers a full range of manual accessories.

Partial stroke test device (PSTD)
Provides a method of testing ESD packages without shutdown.

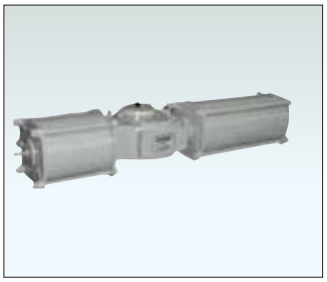
Lockout
Integral lockout allows safe shutdowns for maintenance and isolation of systems.



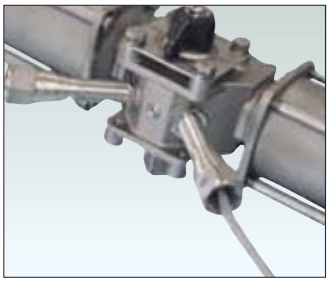
Jackscrew override (JSO)
Manual operation when power is lost. Simple and effective.



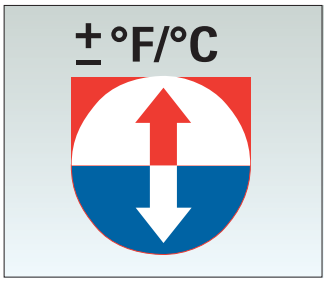
Hydraulic override (MHP)
Manual operation when power is lost. Includes speed controls.



AWWA
Tested per American Waterworks Association C540. Available for pneumatic or water service operation.



Direct mounting cast adapters
Many valve top works covered, including some ISO mounting. Assures economic but correct mounting alignment.



Full stroke adjuster
Provides mechanical control of maximum and/or minimum valve stroke.

Epoxy painting (EX)
Offshore rated, three-part coating system for high level of environmental protection.

Proximity switch preparation
Allows installation of cartridge style proximity switches. Leaves top works open for mounting of other devices.

High or low temperature ratings
Standard rating of -20°F to 210°F [-29°C to 99°C] covers most applications. Optional ratings down to -65°F [-54°C] and up to 300°F [149°C].

Optional certification for CE
Manufactured in accordance with the Pressure Equipment Directive 97/23/EC and ATEX 94/9/EC.

Mechanical data

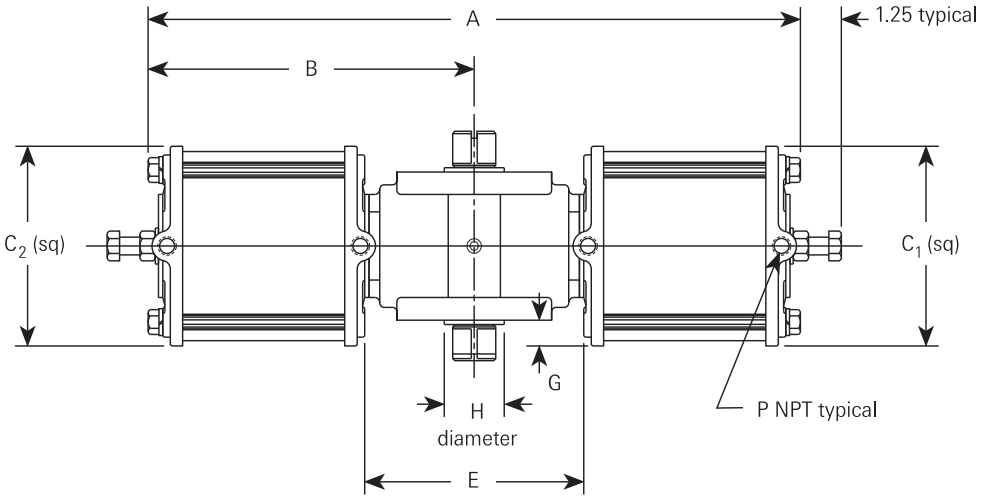
Notes

1. Air consumption:
   Cubic inches in chart represent actual free air volume in cylinder between piston and end cap when furthest apart. Air consumption will vary depending on supply pressure. To determine standard cubic feet per minute use the following formula:

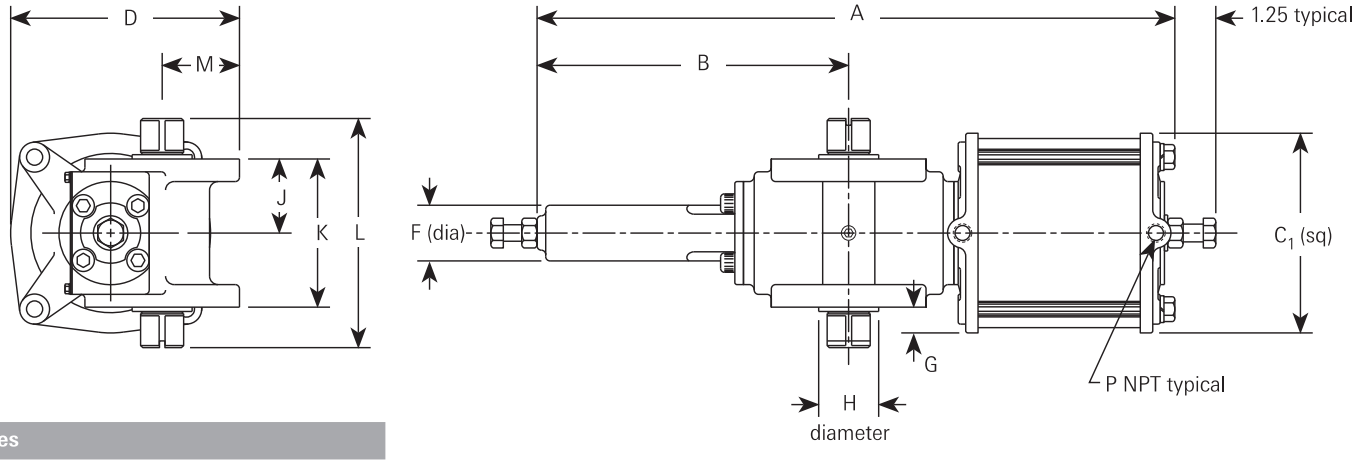
$$SCFM = \left(\frac{\text{Vol. in}^3}{1728}\right)\left(\frac{\text{Supply air barg} + 14.7}{14.7}\right)\left(\text{Strokes/min}\right)$$

   Example: Calculate SCFM for model 023 double acting using 80 pisg air supply and 5 strokes/minute.



$$SCFM = \left(\frac{45}{1728}\right)\left(\frac{80 + 14.7}{14.7}\right)\left(5\right) \quad SCFM = 0.84$$

2. Cycle times shown represent average time to stroke 90 degrees using standard pilot valves and should be used as a guide only. Cycle times can be increased or decreased dramatically by using speed controls, oversized pilot valves or quick exhaust valves.



How to order

1. Double acting (symmetrical yoke) example:
   Air supply: 80 psig
   Break/end torque: 23,100 lb.in.
   B-210U-D000
   B : Series
   210 : Model number
   U : UNC mounting threads
   D : Double acting
   000 : No spring
2. Spring return (symmetrical yoke) example:
   Air supply: 80 psig
   End torque: 8085 lb.in.
   B-210U-S080
   B : Series
   210 : Model number
   U : UNC mounting threads
   S : Spring return
   080 : Spring set code
3. Double acting (canted yoke) example:
   Air supply: 80 psig
   Break (CCW) torque: 31,185 lb.in.
   End (CW) torque: 30,030 lb.in.
   B-210UC-D000
   B : Series
   210 : Model number
   U : UNC mounting threads
   C : Canted yoke
   D : Double acting
   000 : No spring
4. For all spring return models:
   - Use required torque to determine spring set code (see MORMC-0333).
   - All spring sets ending with '0' fail clockwise (40, 50, 60, etc.).
   - All spring sets ending with '1' fail counterclockwise (41, 51, 61, etc.).
   - All symmetrical yoke models between 006 and 100 may be mounted to fail clockwise or counterclockwise by 'flipping' along the longitudinal axis.

Series B dimensions
Models 046, 058, 059, 072 and 100

Models 006, 015, 023, 036 and 050

The series S actuator (all stainless)

Setting an unrivaled standard in actuation at a price unexpectedly
low for stainless steel.

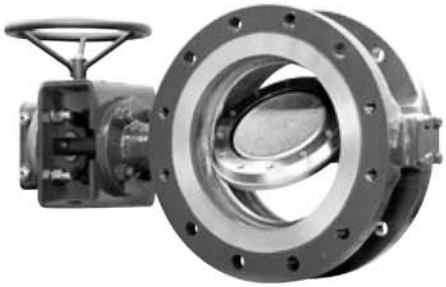
- Up to 160 psig max operating pressure (see torque chart, MORMC-0333).
- Double acting break torques to 240,000 lb.in.
- Spring end torques to 104,125 lb.in.

For additional information, refer to datasheet MORMC-0024.

The series HP actuator

High pressure actuation with carbon steel cylinders for superior corrosion resistance.

- Up to 2250 psig max operating pressure (see torque chart, MORMC-0333).
- Double acting torques to 800,000 lb.in.
- Spring end torques to 400,000 lb.in.



For additional information, refer to datasheet MORMC-0072.

VANESSA SERIES 30,000

INSTALLATION AND MAINTENANCE INSTRUCTIONS

Installation and Maintenance Instructions Vanessa Series 30,000 - Basic configuration body style double flanged, wafer, lug and buttweld

Applicable product range

- Series 30,000 Basic configuration, double flanged body style, which can be installed between two flanges or stud-bolted to either flange.
- Series 30,000 Basic configuration, lug-single flange body style, which must be bolted to either flange.
- Series 30,000 Basic configuration, wafer body style, which can be installed between two flanges.
- Series 30,000 Basic configuration, buttweld ends, which must be welded to the line.

SECTION 1 - VALVE STORAGE

1.1 Preparation and preservation for shipment

All valves are properly packed in order to protect the parts that are subject to deterioration during transportation and storage on site. In particular, the following precautions should be taken:

1 The valves must be packed with the disc in the closed position. The flange sealing surfaces (raised faces) of the valves will be protected with suitable protective grease. The end faces of the valve must be protected with plastic or wooden discs fixed with straps.

2 Bare shaft valves: the ends of the shaft must be protected with plastic tubes.

3 Valves with actuators: in case of "fail open" pneumatic - hydraulic actuators with manual override, the manual override shall be used to manually close the valves and to lock them in position. If there is no manual override, cut outs are made in the flange protectors for the disc, and the disc is securely protected.

All actuated valves must be securely palleted or crated with particular attention, in order to ensure that parts of actuator (especially pneumatic piping or accessories) do not extend beyond the skid/crate.

4 The type of packing must be defined in the customer's order and will be appropriate to ensure safe transportation to final destination and eventual conservation before installation.

1.2 Handling requirements

A - Packed valves

Crates: Lifting and handling of the packed valves in crates will be carried out by a fork lift truck, by means of the appropriate fork hitches.

Cases: The lifting of packed valves in cases will be carried out in the lifting points and in the center of gravity position which have been marked. The transportation of all packed material must be carried out safely and following the local safety regulations.

B - Unpacked valves

1 The lifting and the handling of these valves has to be carried out by using appropriate means and by respecting the carrying limits. The handling must be carried out on pallets, protecting the machined surfaces to avoid any damage.

2 With large dimension valves, the sling and the hooking of the load must be carried out by using the appropriate tools (brackets, hook, fasteners, ropes) and load balancing tools in order to prevent them from falling or moving during the lifting and handling.

© 2012 Pentair plc. All Rights Reserved.

1.3 Storage and preservation before installation

In case the valves have to be stored before installation, the storage has to be carried out in a controlled way, and has to be performed in accordance to the following criteria:

1 The valves have to be stocked in a closed, clean and dry storage room.
2 The disc must be in the closed position, and the end faces must be protected with plastic or wooden discs fixed with straps. If possible, keep the original protection.
3 Periodical checks have to be carried out in the storage area to verify that the above mentioned conditions are maintained.

NOTE

Storage in an open area for a limited period can be considered only in case the valves have appropriate packing (packed in cases lined with tarred paper, and contents well protected with barrier sacks).

CAUTION

For valve handling and/or lifting, the lifting equipment (fasteners, hooks, etc.) must be sized and selected while taking into account the valve weight indicated in the packing list and/or delivery note. Lifting and handling must be made only by qualified personnel.

Fasteners must be protected by plastic covers in sharp corner areas.

Caution must be taken during the handling to avoid that this equipment passes over the workers or over any other place where a possible fall could cause damage. In any case, the local safety regulations must be respected.

NOTE

Solutions A and C are applicable when the protrusion of the bottom hub from the flange or body is sufficient to position securely the lifting strap.
Solutions B and D are applicable when the protrusion of the bottom hub from the flanges is NOT sufficient to position securely the lifting strap.
In presence of solution B, insert a stud bolt and fix it securely with nuts as indicated in the drawing detail.
In presence of solution D, insert a lifting eyelet in the flange threaded holes close to the bottom hub and fix it securely as indicated in the drawing detail.

LIFTING AND HANDLING OF VALVES INSTALLED IN HORIZONTAL PIPELINE

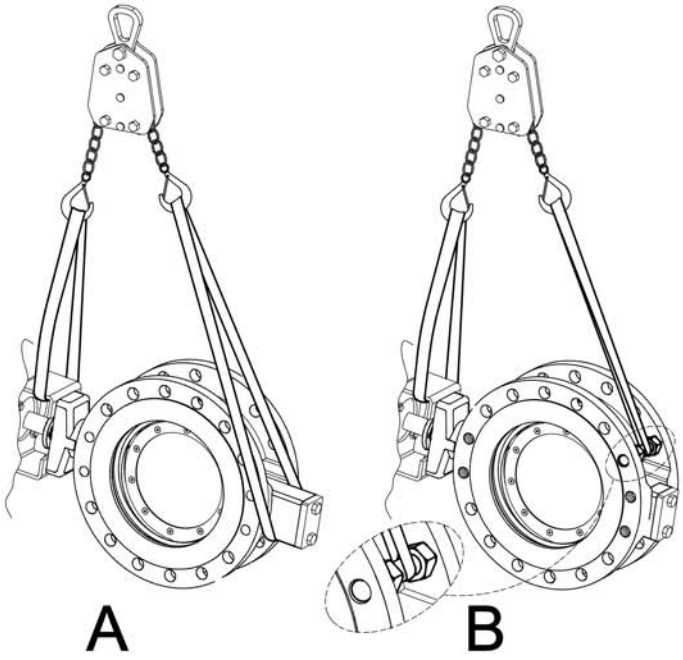

FIGURE NO. 1A

LIFTING AND HANDLING OF VALVES INSTALLED IN VERTICAL PIPELINE

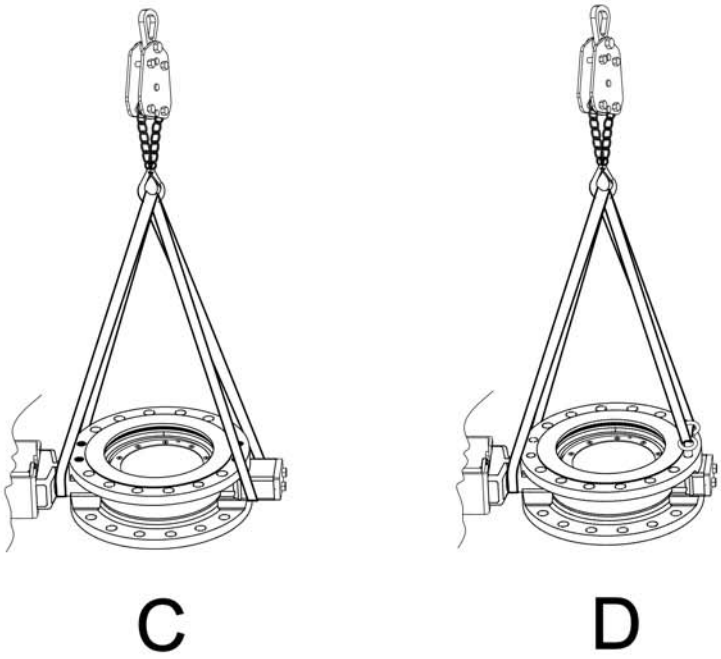

FIGURE NO. 1B

SECTION 2 - INSTALLATION

2.1 Valve inspection

1 Carefully remove the valve from the shipping package (box or pallet) avoiding any damage to the valve or, in case of automated valves, to the electric or pneumatic/ hydraulic actuator or instrumentation.
2 The valves are shipped with the ends protected with caps and a thin layer of protective grease. Before installing the valve, remove the caps and clean carefully, then de-grease both surfaces with a solvent. Clean the inside of the valve using an air line. Ensure that there are no solid objects such as pieces of wood, plastic or packing materials within the valve or on the valve seat.
3 Inspect the seal ring to ensure that it was not damaged during handling. This is especially important in case of valves shipped with the disc in the open position and with "fail-open" actuators.
4 Confirm that the materials of construction listed on the valve nameplate are appropriate for the service intended and are as specified.
5 Ensure that the packing gland adjusting nuts against the packing gland flange cannot be rotated by hand.

2.2 Valve installation

Vanessa recommends that the optimum valve installation is with the shaft in the horizontal plane, after which it is preferable to have the shaft at an angle so as to minimize any problem associated with solid particles present in the fluid that otherwise could deposit in the lower bearing area.

NOTE

The Vanessa valve is designed to withstand design differential pressure in both directions.

Isolating applications

The valve operating torque affects the sealing performances. Vanessa attached the indication plate ΔP (figure 2) on the upstream flange as a reference for the direction of the installation.
The best sealing performance, also for bi-directional service, will be maintained when pressure acts on the shaft side of the valve, which is recommended when the service tightness requirements are more stringent in one specific direction.

Control applications (uni-directional, where perfect sealing is not required)

The plate could be fixed on either flange indicating the preferred direction. Please respect the direction of installation indicated on the relevant flange. The selection of the actuator has been made for that specific direction of installation.

Unless otherwise recommended by Vanessa, the valve should be installed with the disc in the closed position to ensure that the seal ring in the disc is not damaged during installation. Particular care should be taken with those valves equipped with "fail-open" actuators.
For operating temperatures above 200°C (392°F) thermal insulation of the valve body is recommended.
If the valve has threaded tapped holes in the hub areas, Vanessa recommends to use hexagonal head bolts or shorter studs to connect the valve in this zone. The depth of the tapped holes in the bodies of all Series 30,000 valves is specified in the technical literature. Failure to use correct bolts/studs may result in damage to the valve.
If the valve has welded ends, perfectly clean and degrease the ends to be welded (of both valve and pipe), using a cloth with acetone or similar product. Insert correctly the valve between the edges of the pipe to be welded, taking care of the plate that indicates the preferential side for sealing. Carry out an initial accurate spot welding verifying the perfect alignment of the edge and axis of the valve. Carry out the welding of the edge proceeding in alternate way on both sides to reduce the tensions introduced by the welding. It is important to respect the interpass temperature which must not go above 150°C (302°F).
Handling and lifting of the valves during installation MUST be performed following the same criteria and instructions described in previous points "1.2 Handling requirements" and "1.3 Storage and preservation before Installation".

IMPORTANT

The valve trim is designed to withstand and to seal against the design differential pressure marked on the valve nameplate which data are supplied together with the present document.
Since it is impossible to maintain complete control on the external input forces to the trim coming from gear/actuator, the valve trim shall not be used as a final protective mean against the hazard caused by the closed valve upstream pressure.

IMPORTANT

It is recommended to perform piping flushing before installation of valve.
If this is not possible, the valves must be set with the disc in full open position before starting with flushing.

CAUTIONS

When the pipe is lined, be careful that the disc does not come into contact with the lining during its stroke, especially in lug and wafer body styles. This verification is very important to avoid any damage to the valve.

FIGURE 2

2.3 Valve verification

1 Tighten the packing just enough to prevent stem leakage. Over-tightening will decrease packing life and increase operating torque.
2 Check the operation of the valve by stroking it to "full open" and "full close". To verify the valve orientation, the disc position indicator mark on the shaft (during the normal open to close cycle) should rotate clockwise from a position in line with the pipe (see figure 3a) to a position parallel to the pipe flanges (see figure 3b).

IMPORTANT

If piping system is pressurized with water for testing, and in case the piping system has been shut down after testing for a long time, the following recommendations should be adopted:

a. Use corrosion inhibitor with water to pressurize the piping system.
b. After testing, the piping system should be depressurized and the test water completely drained.
c. After testing, valves must be maneuvered through a complete opening/closing cycle and disc left in half-open position. Apply a film of protective oil in the packing area by means of a paintbrush. The protective oil must fill the area between shaft and packing bushing.

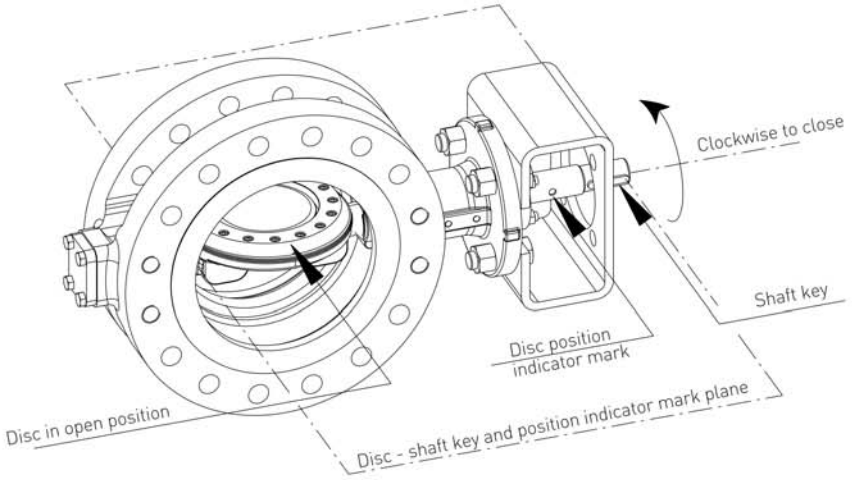

FIGURE NO. 3A

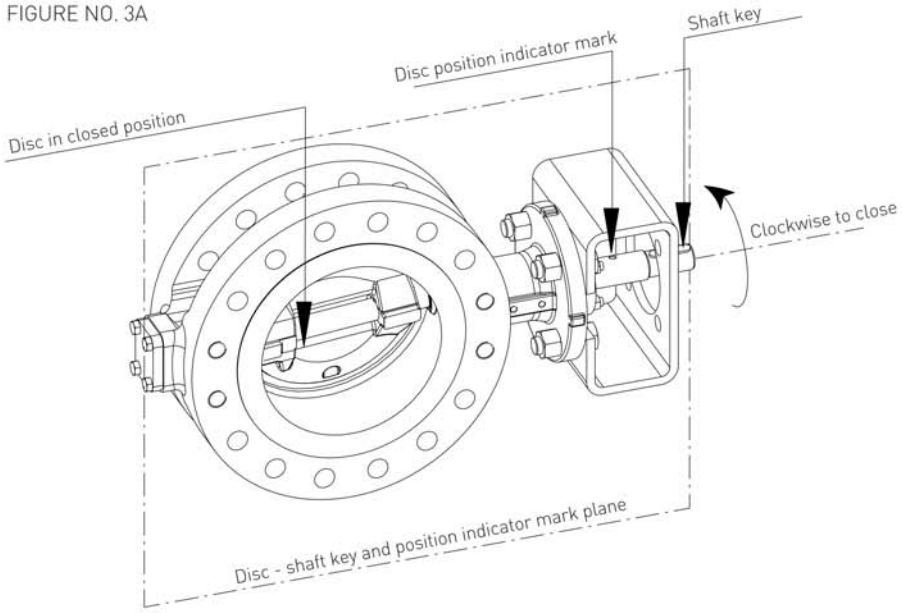

FIGURE NO. 3B

2.4 TROUBLESHOOTING GUIDE

Symptom	Possible cause	Resolution
Valve won't rotate	1. Packing is too tight	1. Loosen gland nuts
	2. Actuator has failed	2. Replace or repair
	3. Valve packed with debris	3. Flush or clean valve to remove debris
	4. Stem key has sheared	4. Determine cause of shearing and correctly replace stem key
	5. Fluid solidification between bearings and shaft	5. Flush bearings by flushing holes (if present)
Stem packing leaking	1. Gland flange nuts too loose	1. Tighten gland flange nuts
	2. Packing damaged	2. Replace packing - see Paragraph 3.1
Bottom flange gasket leaking	1. Bottom flange bolting loose	1. Tighten bottom flange bolting
	2. Spiral wound gasket damage	2. Replace gasket - see Paragraph 3.3
Valve leaking	1. Valve not fully closed	1. Close valve
	2. Debris trapped in valve	2. Cycle and flush (with valve open) to remove debris
	3. Actuator mechanical stops improperly set	3. Remove the stop for closure and reset properly
	4. Seal ring damaged	4. Replace seal ring - see Paragraph 3.2
Jerky operation	1. Packing is too tight	1. Loosen gland nuts, cycle valve, retighten
	2. Air supply inadequate	2. Increase air supply pressure and/or volume
	3. Actuator/stem adapter misaligned	3. Remove actuator mounting and realign

SECTION 3 - MAINTENANCE

The Vanessa Series 30,000 has been designed to require a minimum of maintenance.

WARNING!
Depressurize the line before starting any maintenance. Failure to do so may cause serious personal injury and/or equipment damage.

3.1 Packing maintenance

If shaft leakage is observed through the packing, tighten the gland nuts slowly and evenly until the leakage stops.

CAUTION
Do not over-tighten packing gland nuts. Over-tightening will increase the torque required to operate the valve.
When tightening the gland nut, use half-turn increments until leakage has stopped.

Please refer to the figure no. 4.
To replace the packing proceed as follows:

1 Remove the gear/actuator and relevant connecting keys (4f). Please note the actuator position relative to the valve position for reassembly of gear/actuator later.
2 Remove gland nuts (5d). If present, remove belleville springs (5n), taking care of noting their assembly configuration to reassemble them correctly (point 7).
3 Remove packing gland flange (5f), anti blow-out ring if present (5g), and gland bushing (5c).
4 Remove packing (5a). If valve is with packing flush option, remove lantern ring also (5h).
5 Carefully clean packing cavity and shaft (4a).
6 Apply a thin film of lubricant on each new packing ring (5a) surfaces (lubricant should be in accordance with Table IV). Insert new packing rings, paying attention to insert the two braided rings at the bottom and top of the entire packing. If valve is with packing flush option, insert the lantern ring (5h) in the same sequence as previously removed (or as indicated in figure 4). If the packing rings are of the split variety, install with splits staggered at 180° from each other.
7 Reassemble gland bushing (5c), anti blow-out ring if present (5g), and gland flange (5f). If present, assemble the belleville springs (5n), following the assembly configuration noted in the previous point 2, then assemble by hand the gland nuts (5d) without tightening (after applying a thin film of lubricant on the threads of the stud bolts, in accordance with Table IV).
8 Reassemble keys (4f) on the upper stem end.
9 Reassemble gear/actuator and close the valve.

CAUTION
Do not force actuator on the stem! This should be a free moving fit.

10 Tighten gland nuts (5d) in accordance to Table I (Torque values for gland nuts).
11 Cycle the valve.
12 Pressurize again the line.
13 If a leakage is detected, tighten the gland nuts slowly and evenly until the leakage stops.

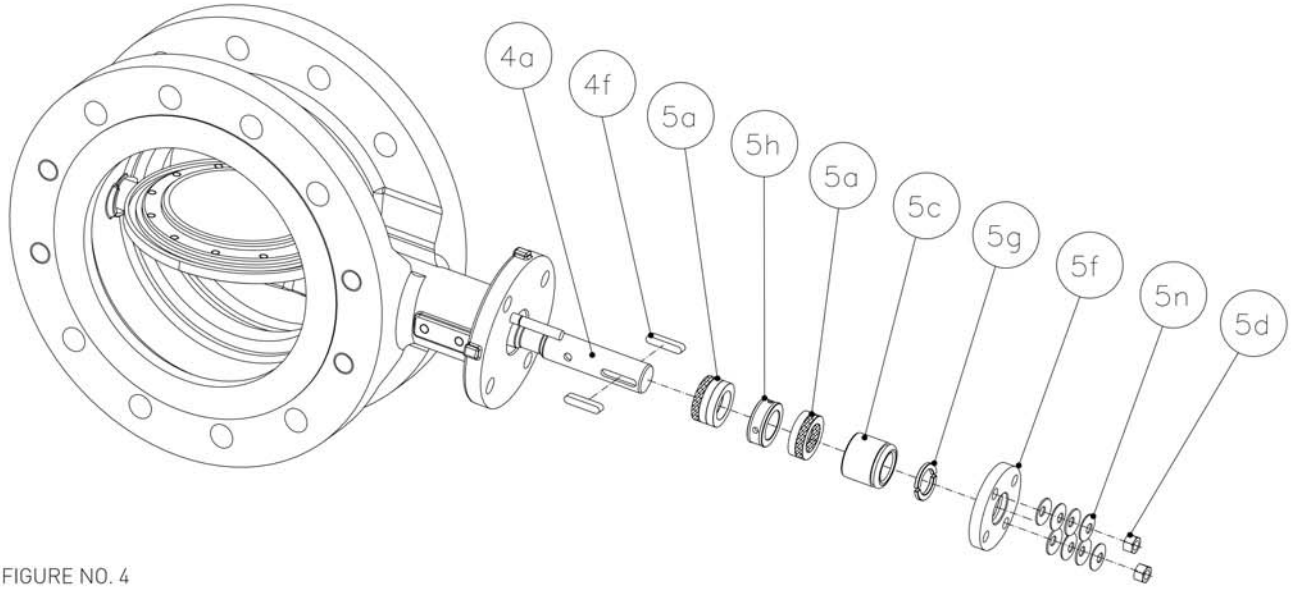

FIGURE NO. 4

3.2 Sealing elements maintenance

To replace the sealing elements proceed as follows (please refer to figure no. 5):

WARNING!

Depressurize the line before starting any maintenance. Failure to do so may cause seriouspersonal injury and/or damage to the valve.

1 Remove the valve with the disc in the closed position from line. Clean the valve according to proper cleaning procedure as outlined by the plant or according to a recommended procedure.
2 Open the valve a few degrees.
3 Loosen the seal retainer ring screws (2c).
4 Open valve to full open position.

NOTE

In small size valves it may be easier to unbolt the actuator and rotate the disc beyond the full-open position to provide more space to work with components.

5 Carefully remove the retainer ring screws (2c) with security washers (2d), then remove the seal retaining ring (2b).
6 Remove seal ring (3a) and spiral wound gasket (3b).
7 Inspect the body seat. Clean it, if necessary, with fine abrasive cloth (No. 600 or finer), after having cleaned it perfectly with solvent.
8 Inspect and clean the disc seal ring area and spiral wound gasket groove. No foreign particles must be present before spiral wound gasket and seal ring assembly.
9 Apply a thin film of lubricant on the surface area of the disc (2a) where seal ring (3a) and spiral wound gasket (3b) will be located (lubricant should be in accordance with Table IV).

CAUTION

Apply only a thin film of lubricant where indicated. Failure to do so will hinder the assembly and may cause damage to the valve.

10 Assemble the new spiral wound gasket (3b) in the disc groove, without forcing and taking care not to damage it.
11 Replace seal ring (3a) on the disc through the shaft side of the body. To properly locate the seal ring, there are two different solutions:
   • solution 1 - ref. to figure no. 6a: align the internal slot of the seal ring (3a) to the reference pin (F).
   • solution 2 - ref. to figure no. 6b: align the reference mark (C) on the seal ring (3a) with the relevant reference mark (D) on the disc.
12 Assemble the seal retainer ring (2b). There are two different solutions as per previous point 11:
   • solution 1 - ref. to figure no. 6a: make sure that the slot on the edge of the seal retainer ring (B) is in correspondence with reference pin (F).
   • solution 2 - ref. to figure no. 6b: ensure to locate the hole (E) of the seal retainer ring with the relevant marks on the disc (D) and seal ring (C).
13 Hand tighten all the fastening screws (2c), with relevant lock washers (2d) after applying Loctite® 270 or equivalent on the bottom side of the threads (they have to be perfectly cleaned with solvent before applying Loctite®). Then, verify that the seal ring can be moved freely by hand without rotating it.
14 Apply a thin film of lubricant to the body seat and to the external edge (sealing conical surface) of the seal ring (3a). Lubricant should be in accordance with Table IV.
15 Seat and unseat the valve twice.
16 Keep the valve in the closed position without applying torque. Tighten at least two retaining screws (2c) to avoid the seal ring moving from the position found.

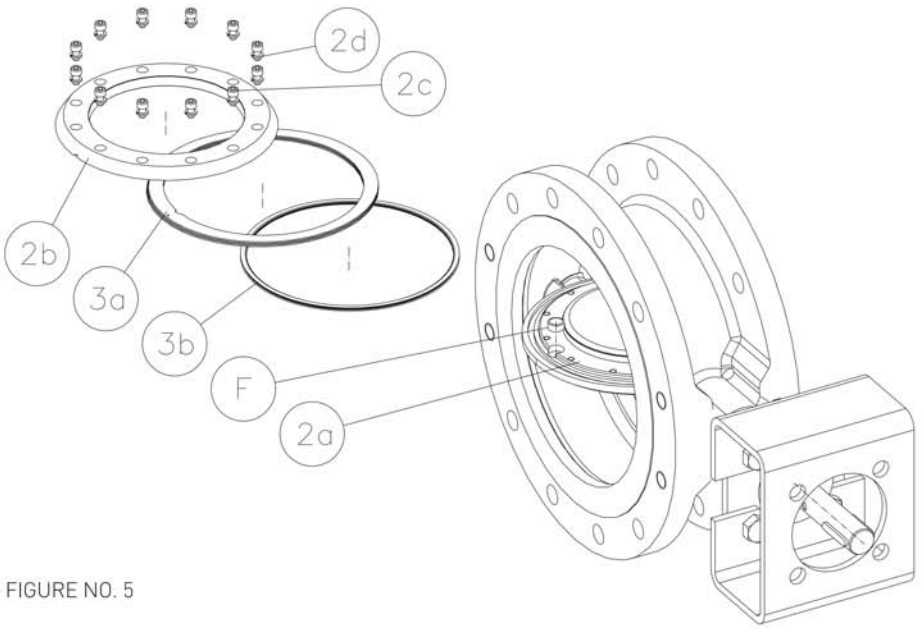

FIGURE NO. 5

17 Open the disc a few degrees and tighten, using a torque wrench, all screws (2c).
Use a torque value from Table III for valves according to solution 1 (ref. to figure no. 6a).
Use instead a torque value from Table II for valves according to solution 2 (ref. to figure no. 6b).
It is recommended to use the crossover method to tighten all retaining screws.

IMPORTANT!

• *Solution 1- ref. to figure no. 6a:*
The seal ring is supplied with an index marking (A). After the complete assembling, verify that the index marking (A) can be seen in the slot (B) of the seal retainer flange.
Slot (B) and marking (A) have to be perfectly aligned.
If not visible or not aligned, loosen the retaining screws, re-align the index marking and start again the procedure from point 12.

• *Solution 2 - ref. to figure no. 6b:*
The seal ring and the disc are completed with two reference markings, (C) and (D).
After the complete assembling, verify that both markings can be seen through the hole (E) of the seal retainer flange. The two markings have to be perfectly aligned.
If not visible or not aligned, loose the retaining screws, re-align the index markings and start again the procedure from point 12.

3.3 Bottom flange gasket maintenance

If necessary to replace the bottom spiral wound gasket, proceed as follows (see fig. no. 7):

1 Remove the bottom flange (6a).
2 Remove the spiral wound gasket (6c).
3 Inspect and clean the groove of the spiral wound gasket in the body and in the bottom flange.
4 Apply a thin film of lubricant on the bottom spiral wound gasket (6c), then insert it on the bottom flange (6a), centering and positioning all on the body bore (lubricant should be in accordance with Table IV). Rotate the bottom flange to accommodate the correct position and center the holes with the threaded holes on the body.
5 Apply a thin film of lubricant on the threads of the screws (6b), then introduce and tighten them using a torque value from Table III (lubricant should be in accordance with Table IV).

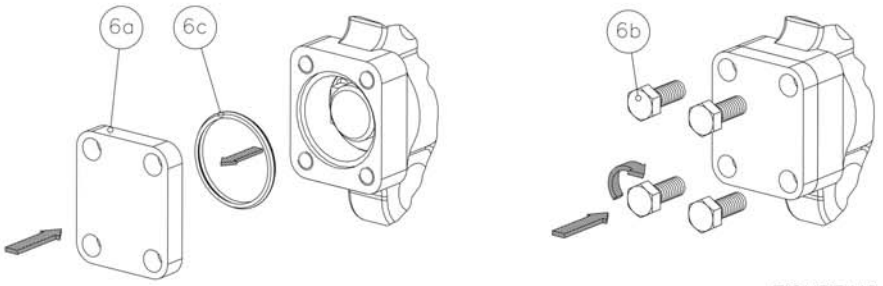

FIGURE NO. 7

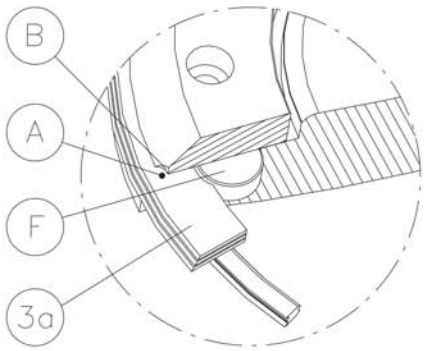

FIGURE NO. 6A

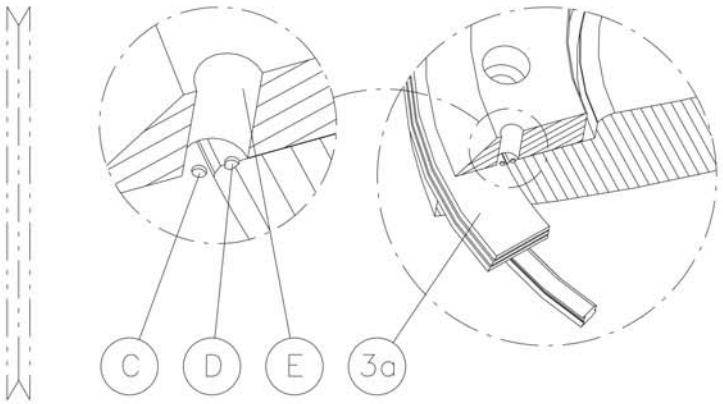

FIGURE NO. 6B

SECTION 4 - STANDARD OPTIONS

This section (4) is referred only to Vanessa products configured with the following options:
- bearing and packing flushing,
- live loaded packing.

4.1 Bearing and packing flushing

4.1.1 Bearing flushing

The bearing flushing option is obtained by adding two tapped holes, one in the bottom flange and one in the neck of the valve (see fig. 9). This option includes the introduction of a lantern ring at the bottom of the valve packing. Bearing flushing is recommended when the valve is installed in a service where the particles present in the fluid or the line fluid itself can migrate into the shaft/bearing area causing problems. A typical example is sulphur recovery services, where the sulphur in a liquid or gaseous state may enter this area and crystallise as a consequence of the plant shutdown.

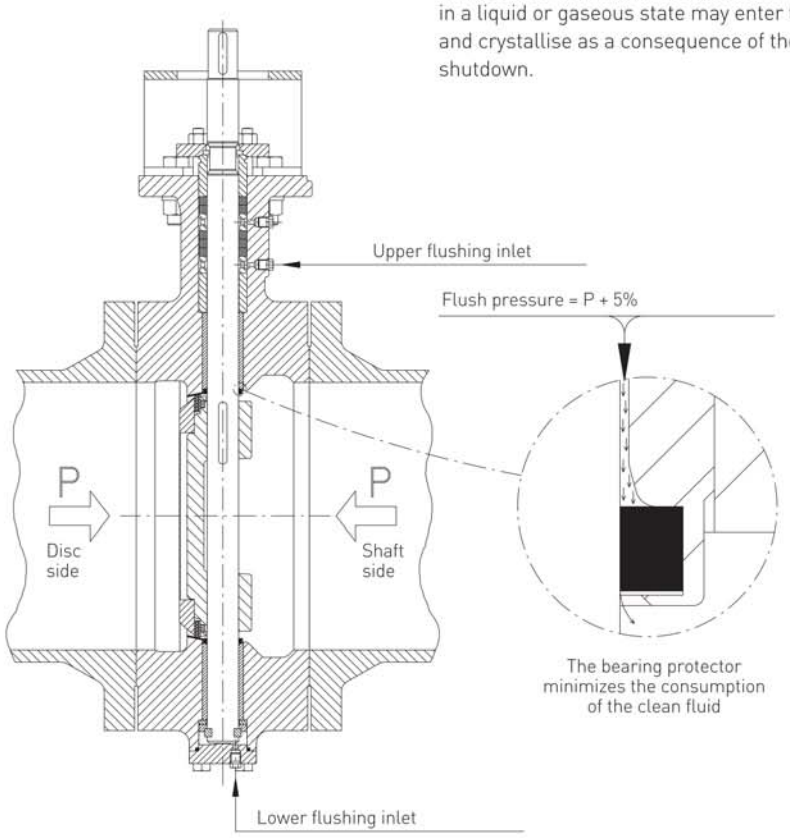

FIGURE NO. 8

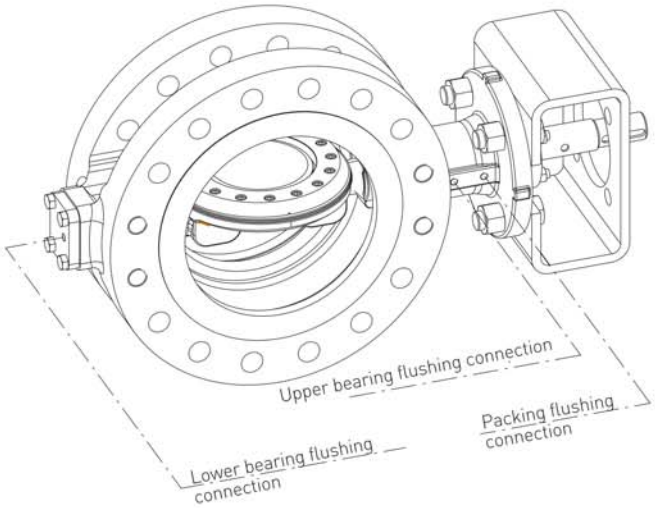

FIGURE NO. 9

This crystallisation may result in an increase in the torque requirement of the valve. Another example may be a fluid that contains particles (e.g. catalyst) that may cause similar problems to those highlighted above.
In these types of situations the bearing flushing may be used to introduce an inert fluid compatible with the process via the bearing flush taps (see fig. 8) so as to create a pressure barrier which prevents the introduction of the unwanted products from the line into the shaft/bearing area. The pressure of the flushing fluid must be slightly higher than the line pressure (i.e. P1 + approx 5%). This both acts as a safety measure and is a positive step in increasing the lifetime of the valve, as well as maintaining the constant torque requirement and hence operability of the valve.
The bearings may be continuously flushed, this is recommended by Vanessa for critical services such as described above. Periodic flushing may be used for less critical services in order to clean the bearing/shaft interface or in order to prepare the valve for a shutdown of the process.
The bearing flush taps may also be used to introduce a lubricant compatible with the process to the bearing areas for high cycle or dry gas service. The presence of the bearing protector drastically reduces the consumption of the flushing or lubricant by reducing the amount of fluid required to give efficient service (see fig. 8).
Further information is available from Vanessa on request.

4.1.2 Packing flushing
The packing flushing option is obtained by the introduction of a tapped hole that communicates directly to the packing set in the neck of the valve via a lantern ring. This option can be used to monitor the rate of emission of the line fluid toward the atmosphere (it is important to point out that the packing of the Vanessa valve fully complies with TA Luft and EPA requirements). This flush tap may also be used to capture and evacuate line fluid so as to prevent any atmospheric loss, with the lantern ring and split packing configuration acting as a double block and bleed unit.

A suitable fluid may also be introduced via the packing flush tap into the packing area so as to eliminate any possible fugitive emissions (see fig. 9). By keeping the fluid pressurized at a pressure that is higher with respect to the line pressure, the passage of any line fluid towards the atmosphere can be effectively blocked giving the valve excellent fugitive emissions control. However, the fluid used must be compatible with the line fluid as it may have the possibility of finding its way into the line as well as toward the atmosphere.

As with the bearing flushing option this may also be used to introduce a lubricant compatible with the process.

The type of lubricant used for flushing is at the clients' care. Vanessa may be contacted to supply further detailed, process specific information.

4.3 Live loaded packing
The live loaded packing option is designed to supplement the already excellent characteristics of the Vanessa valve packing. This option guarantees a constant compression of the packing set giving a further guarantee of the fugitive emissions control of the Vanessa valve. The fact that the packing is subject to a near constant force supplied by the Belleville washers reduces the maintenance cycle required by the packing (see fig. 10).

Care should be taken in replacing the Belleville springs as their order (parallel or series) should be noted.
The packing nuts should be tightened in accordance with Table I.

At this point it is worth mentioning that the TA Luft test has shown that the Vanessa Series 30,000 std. Packing is more than adequate in passing its stringent requirements.

The live loaded packing option should be considered in valves that are subject to severe cycling duty or valves that are subject to severe thermal cycles.
The drawing shows typical set ups for the live loaded packing option.

32	800	30	22	105	78	165	122	505	372	-	-
36	900	30	22	110	81	220	162	545	402	-	-
40	1000	30	22	110	81	225	166	-	-	-	-
42	1050	30	22	110	81	230	170	-	-	-	-
48	1200	30	22	110	81	235	173	-	-	-	-
54	1350	50	37	155	115	-	-	-	-	-	-
60	1500	65	48	160	118	-	-	-	-	-	-
64	1600	65	48	-	-	-	-	-	-	-	-
72	1800	65	48	-	-	-	-	-	-	-	-
84	2100	65	48	-	-	-	-	-	-	-	-

Note: the torque values are those suggested for the hydraulic test of the body.

TABLE II: Tightening torque values for bolts and screws

Bolt dimensions (mm)	Torque values Torque (Nm)	Torque (ft-lb)
8	12	9
10	24	18
12	41	30
14	66	49
16	103	76
18	142	105
20	201	148
22	274	202
24	348	257

TABLE III: General torque values for bolting

Bolt dimensions (mm)	Torque values Torque (Nm)	Torque (ft-lb)
6	10	7
8	20	15
10	45	33
12	70	52
14	110	81
16	175	129
18	235	173
20	335	247
22	370	273
24	460	339
27	595	439
30	760	561
33	785	579
36	1010	745
39	1315	970
42	1625	1199
45	2035	1501

TABLE IV: Lubrication

Type	Component to lubricate
Light mineral oil	1. Packing rings (5a) 2. Disc surface areas (2a) for seal ring and spiral wound gasket location 3. Spiral wound gasket (6c)
Molykote® - P74 (grease) or equivalent	1. Stud bolts/nuts (5d) 2. Screw (6b)
Molykote® spray - 321 R (dry lubricant) or equivalent	1. Seal ring (3a) 2. Body seat

1. Introduction

1.1. Product Certification

1040/9358: CSA Type 4 (Cert. #LR 81057-3)
2004: CSA Type 4 (Cert. #LR 81057-7)
9044: NEMA 4, 4X (Cert. not applicable)
9468: FMc NI/I/2/ABCD/T4 0° C<= Ta<60° Type 4X, 6P, IP67; DIP/II/2/FG/ T4 0°C<=Ta<60°C (Cert. #3036618C)
5004/5044: FMc IS/I, II, III/1/ABCDEFG/T6 Ta=60°C Entity WD-11880, NI/I/2/ABCD/T5 Ta=60°C Entity WD-11880; Entity Parameters for P&F NJ2-V3-N, Vmax=16 V, Imax=25 mA, PI=34 mW, Ci=40 nF, Li=50 μH (Cert. #3008802); NJ2-11-N-G, Vmax=16 V, Ii=25 mA, PI=34 mW, Ci=30 nF, Li=50 μH
2007/9479: FMc XP/I/1/CD/T6 Ta=60°C, DIP/II/1/EFG/T6 TA=60°C; 9479 ONLY: N/I/I/2 ABCD/T4 Ta=60°C, Type 4, 4X (Cert. #3029311C)
5050: FM XP/I/1/CD/T6 Ta=50°C, DIP/II/1/EFG/T6 Ta=50°C, NI/I/2/ABCD/T4 Ta=50°C, Type 4, 4X (Cert. #3026687)

1.2. Warnings

- Never remove enclosure cover or make/break electrical connections with power connected to the unit.
- Perform all wiring in accordance with site and local codes and the National Electric Code ANSI-NFPA-70 (US) or the Canadian Electric Code Part I (Canada) for the appropriate area classifications.
- Confirm that the AccuTrak model being installed is approved for the hazardous area (see Product Certification section above or unit ID label).
- Confirm that supply power to switches is within rated specifications listed on the unit identification label.
- Protect the unit from exposure to aggressive substances or atmospheres to ensure that hazard rating is not compromised.

1.3. Description

AccuTrak valve position monitors are intended for use as both visual and electrical position indicators for discrete rotary devices, most commonly pneumatically actuated 2-way quarter-turn or 3-way valves. An AccuTrak monitor is not limited for use in only quarter-turn valve applications, but that application will be assumed for the purpose of this document. In addition to the monitoring features, AccuTrak monitors may serve as wiring junctions for accessories where additional terminals, conduit entries and wiring codes permit.

1.4. Principles of Operation

An AccuTrak monitor mounts to an actuator via a mounting kit, usually sold separately. The unit shaft couples to the actuator shaft directly via NAMUR adaptation, or via a coupling provided in the mounting kit. As the actuator

rotates the unit shaft, adjustable cams on the shaft actuate mechanical or proximity switches inside the unit enclosure, at the limits of rotary travel set by the customer. The switches are pre-wired to a terminal strip in the enclosure, permitting easy connection of switch output to external electrical monitoring systems or indication devices. The visual Beacon indicator on the enclosure cover indicates 90° rotary travel between OPEN and CLOSED valve positions, unless ordered optionally for other angular strokes or 3-way valve applications.

1.5. Special Features/Conditions

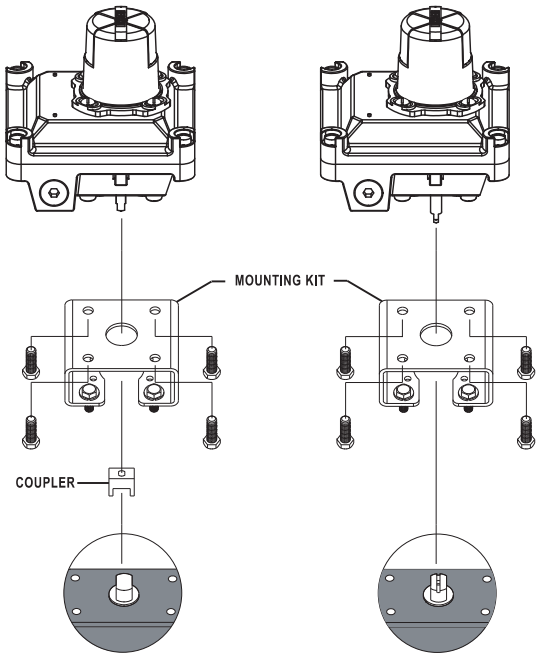
To avoid build-up and discharge of static electricity in a hazardous area, only clean Westlock units with a static-free cloth dampened with water. Avoid the use of alcohol-based cleaners.

2. Ordering

Ordering guides for all AccuTrak product series covered by this IOM are available through a local Westlock distributor, the current Westlock Controls catalog literature or the Westlock Controls website at www.westlockcontrols.com. Spare parts lists for refurbishments or repairs are also available for common AccuTrak models.

3. Definitions

NAMUR- This term, in the context of mounting brackets and shafts, refers to the NAMUR VDI/VDE 3845 standard for the dimensions of actuator output shafts and auxiliary equipment mounting hole patterns. In the context of inductive proximity sensors, NAMUR refers to conformance of the sensor to DIN 19 234, allowing its use with any NAMUR style amplifier/isolator.



Switch- A manual or mechanically actuated device for making, breaking or changing the connections in an electric circuit. This term will be used also for magnetic or inductive proximity sensors for the purpose of this document.

4. Installation

4.1. *Mounting Instructions*

Required Tools: Open-end wrenches or adjustable wrench to fit all sizes of hex head bolts in the mounting kit.

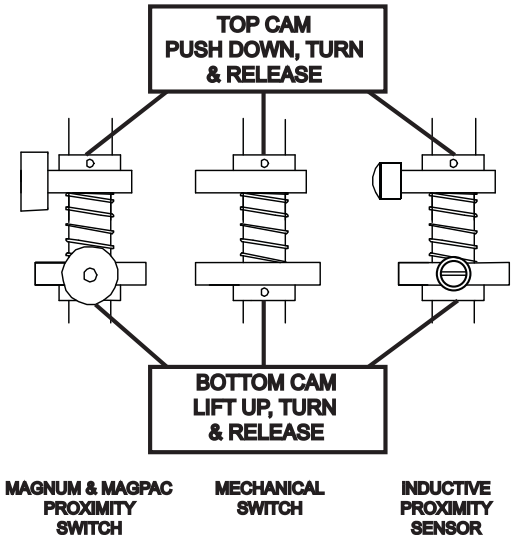
1. Obtain a mounting kit suited for the actuator/valve, commonly available through a local Westlock Controls distributor.
2. Attach the mounting bracket and coupler (if required) to the unit housing with the hardware provided.
3. Attach the unit and mounting system to the actuator.
4. Ensure proper axial alignment between unit shaft, coupler and actuator shaft. Failure to ensure alignment could result in long-term stress-related failure of unit shaft in high cycle or high torque applications.

4.2. Calibration

Consult factory or a Westlock distributor for setting procedures of units with six switches or four switches and transmitter.

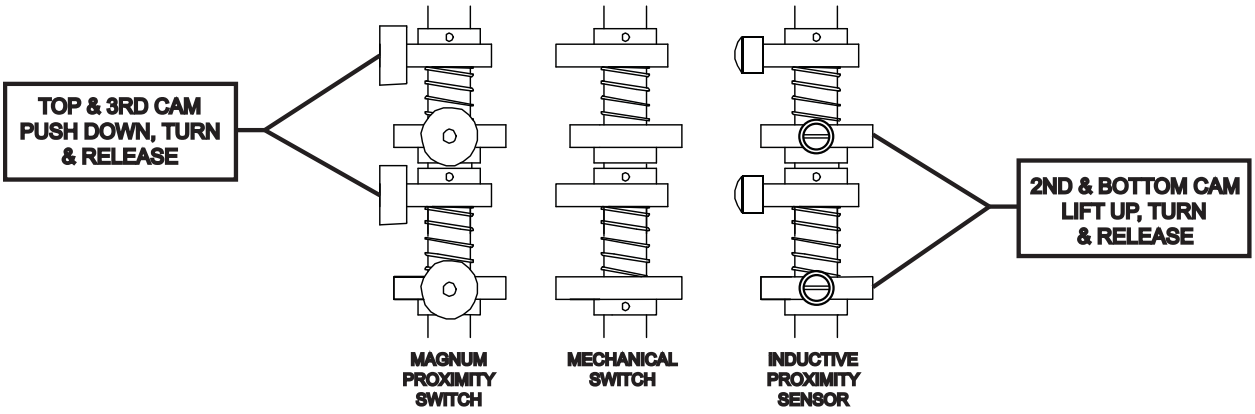
Note 1: Switch actuation can be confirmed using a signal detection device such as a multimeter or ohmmeter, set for “continuity”.

Note 2: For NAMUR P+F NJ2-V3-N type sensors, use test meter, P+F model #1-1350 or equivalent to check sensor actuation and calibration. If the proper meter is not available, contact the factory for additional assistance with the test procedure.



Note 3: Adjust cams by hand by pushing/pulling the cam against the shaft spring to disengage from the mating spline, rotating to adjust and re-engaging firmly onto spline.

Required Tools: Signal detection device (see note 1); slotted screw drivers for cover screws (M4, #10 or 5/16 by model)

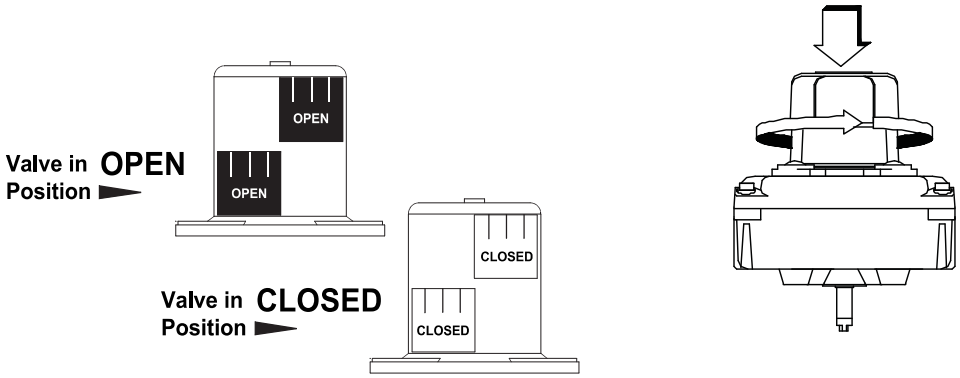


Switch Adjustment (two switches):

1. Remove unit cover as follows: loosen (but do not remove) captive screws, rotate cover slightly to grip corners, pull firmly.
   DO NOT PRY COVER WITH TOOLS.
2. With valve in the closed position, adjust bottom cam until bottom switch (#2) actuates.

3. Stroke valve to the open position, adjust top cam until top switch (#1) actuates.
4. Cycle actuator several times to confirm proper switch indication at each end of stoke. Finely adjust cams if necessary.
5. Skip to Field Wiring section or replace unit cover, applying approximately 20 in-lbs of torque to cover screws.

Switch Adjustment (four switches, no CS transmitter):
Follow steps as above for the calibration of two switches but adjust the first and third cams from the top for switches #1 and #2 and the second and fourth cams from the top for switches #3 and #4 (see illustration below).



Transmitter setting (optional CS transmitter):
For the calibration of optional current signal (CS) transmitter, see Westlock Controls Installation/Operations Manual TECH-301, available through your local sales representative or at www.westlockcontrols.com.

Beacon Adjustment:

Note: Skip this step if cover is flat or Beacon already displays the correct valve status.
Required Tools: slotted screw driver for #12 screws.

1. For two-way OPEN/CLOSED: remove, rotate and re-fasten outer beacon to synchronize displayed position with valve position.
2. For three-way flow paths: remove, rotate and re-fasten outer beacon and/or inner beacon coupler to synchronize displayed flow path with valve/actuator flow path.

5. Field Wiring

STOP
WARNING

See the warnings section of this document for important warnings pertaining to the wiring of AccuTrak units. Remove and replace cover before and after wiring, per instructions given in the Switch Adjustment section above.

Required Tools: slotted screw drivers for terminal strip screws (#2), cover screws (M4, #10 or 5/16 by model), and grounding screw (#8 or M4 by model); wire strippers as required for field wires.

1. Wire the AccuTrak monitor strictly according to the wiring diagram on the inside of the enclosure cover.
2. Confirm that the ground wire is secure under the green grounding screw in the enclosure.
3. Seal all unused conduit entries as required with suitably certified plugs having an ingress protection rating of IP67 or better.
4. Ensure that only suitably certified cable glands are used, having an ingress protection rating of IP67 or better.
5. Ensure that the temperature rating of all field wiring meets the service temperature range of the application.

6. Maintenance and Repair

ATTENTION

Maintenance or repair of Westlock equipment must only be done by Westlock Controls or by qualified personnel that are knowledgeable about the installation of electromechanical equipment in hazardous areas. All parts

needed for repairs or maintenance must be purchased through a Westlock Controls authorized distributor to maintain warrantee and to ensure the safety and compliance of the equipment.

No routine maintenance of Westlock AccuTrak units is recommended when units are installed in environments for which they are designed. Severe environments may warrant regular replacement of field units every two to five years for maximum performance and safety.

Troubleshooting

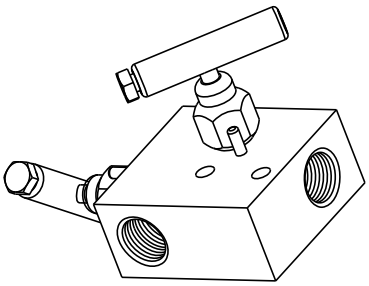
Problem: *No signal at the control device*

- Check that power supply to the loop is functioning correctly and adequate to power all devices on the loop;
- Check that power being supplied to switches is within the rated specifications;
- Check wiring integrity immediately at the connection to the control device;
- Check field wiring coming into the AccuTrak terminal strip for proper connection and good wire preparation practices (approximately ¼" of insulation removed and all strands intact);
- Check that field wiring is no larger than 12AWG for proper fit in terminal strip and compliance with terminal strip rating;
- Check that wiring integrity is good between switches and terminal strip;
- Check that cams are set to trigger switches properly in each valve position (see Switch Adjustment section under installation);
- Use multimeter set for "continuity: to check for failed switch; observe continuity between common and normally open when triggered and between common normally closed when not triggered.

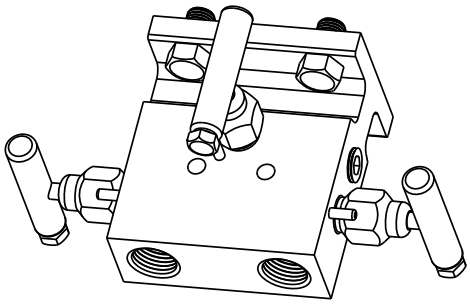
Problem: *Beacon does not display the correct flow path*

Reset Beacon per the Beacon Adjustment section under Calibration.

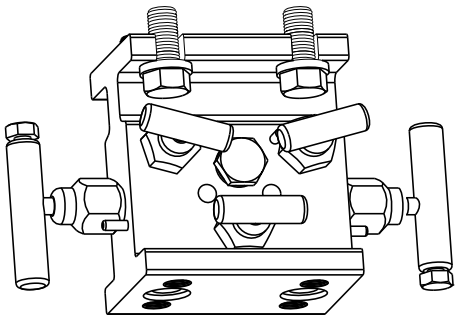
Problem: *Unit appears to be binding during valve stroke or unit shaft has broken*



Carefully measure and adjust axial alignment of unit shaft, coupler and actuator shaft to eliminate lifting or twisting of the coupler during travel.



Problem: *Unit has signs of moisture ingress*



- Check torque on cover screws
- Check gaskets and sealing surfaces for debris and clean if necessary
- Check that conduit connections are properly sealed, including gland fittings and quick-disconnect receptacles
- Check that conduit pipes are properly pitched to direct condensing moisture away from units
- Check that all unused conduit entries are properly sealed with suitably certified plugs having an ingress protection rating of IP67 or better.

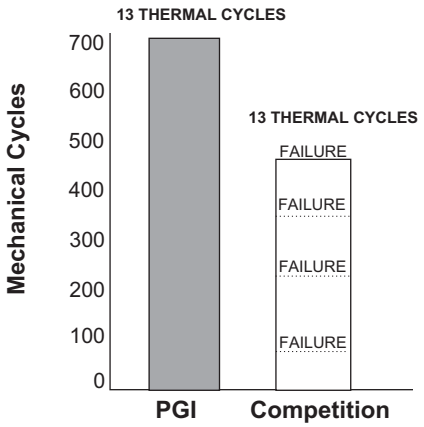
Teflon® *Pressure-Core*™ Stem Seal
Bonnet and Packing Design

.125" 136" .187" .250" .375" ORIFICE

Pressure-Core™ Stem Seal

Compared to competitive valve designs, PGI's *Pressure-Core*™ Seal offers leak-free performance with no maintenance requirements. To support this claim, we tested the *Pressure-Core*™ Seal against the leading manufacturer's design. The tests simulated harsh plant operating environments and were performed by an independent laboratory in accordance with EPA Method 21.

P A T E N T E D



How We Do It!

The *Pressure-Core*™ Seal consists of an outer Teflon® shell with an elliptical shaped Viton® O-ring core. The encapsulated core is "live-loaded" and provides constant outward pressure against the Teflon® shell, which flexes under pressure like an O-ring. The Teflon® shell offers the desired chemical resistance without periodic gland tightening as in conventional designs.

Our test results indicate that you can have a reliable, affordable and virtually leak-free valve requiring no costly, time-consuming maintenance. We stand behind our claim with a **five year warranty**, far exceeding the industry standard.

5 year warranty

FUGITIVE EMISSIONS TEST RESULTS

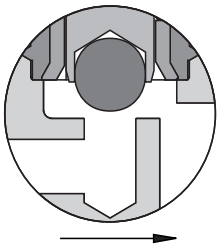
See for yourself how our Pressure-Core Seal not only outperforms the leading manufacturer's design, but sets a new industry standard.

TEST PROCEDURE

Valves mechanically cycled 50 times (full open to full close) at 1,000 PSI methane, then heated to 400° F and air cooled to ambient. Procedure repeated until failure.

FAILURE CRITERIA

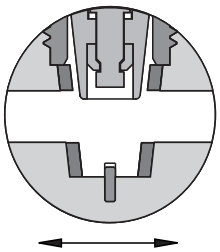
100 PPM Leak
(Competitor's Emission Seal Warranty)



TEST RESULTS

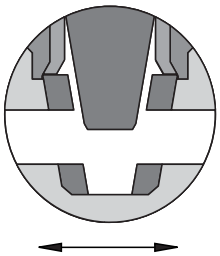
PGI: The Pressure-Core Seal successfully completed **694** mechanical cycles and **15** thermal cycles. Maximum leakage throughout testing was **40** PPM.

Competition: The leading manufacturer's "low emissions" graphite design failed on the **89th** mechanical cycle and on average every **125** cycles throughout the testing. Repeated maintenance was required between each failure to readjust the valve packing.



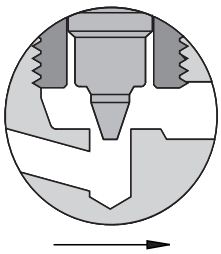
Seat Designs ~ Features and Benefits

.136" .187" .250" .375" ORIFICE



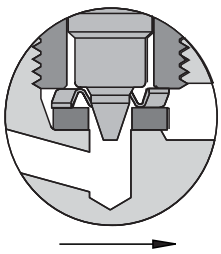
HARD BALL SEAT ~ .136" .187" .375" Orifice

FEATURES	BENEFITS
• PGI Standard Carbide *Ball* Seat	• Non-rotating ball eliminates seat galling and ball creasing • Leak free, bubble tight seating • Available in a variety of materials



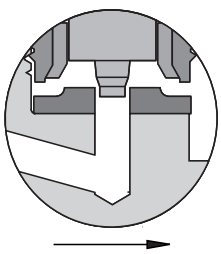
316 SS CONE SEAT ~ .375" Orifice

FEATURES	BENEFITS
• PGI 316 SS *Cone* Seat	• Non-rotating stem tip • Roddable straight-through design • Easily replaced • Bi-directional flow



SOFT SEAT ~ .187" .250" .375" Orifice

FEATURES	BENEFITS
• PGI Soft *Cone* Seat	• Roddable straight-through design • Leak free, bubble tight seating • Easily replaced • Available in a variety of materials • Bi-directional flow



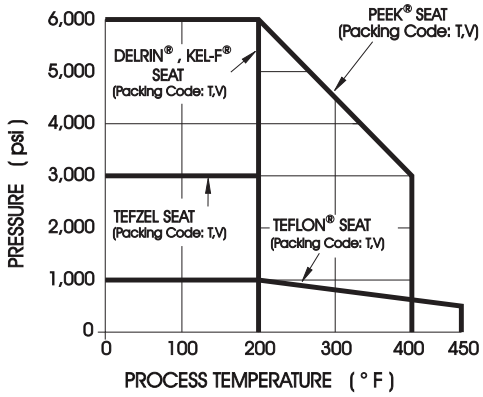
INTEGRAL METAL TO METAL SEAT ~ .136" Orifice [Mini Packed Valves]

FEATURES	BENEFITS
• PGI Integral Metal Seat	• Throtting and shut-off design • Interchangeable between soft or metal seats

SOFT "WASHER" SEAT ~ .136" Orifice [Mini Packed Valves]

FEATURES	BENEFITS
• PGI “Washer” Seat	• Throtting and shut-off design • Interchangeable between soft or metal seats • Easily replaced • Available in a variety of materials

SOFT "WASHER" SEAT ~ .125" .136" Orifice



FEATURES	BENEFITS
• PGI “Washer” Seat	• Throtting and shut-off design • Four times the sealing area • Easily replaced • Available in a variety of materials

Description

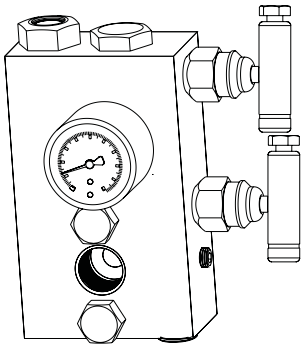
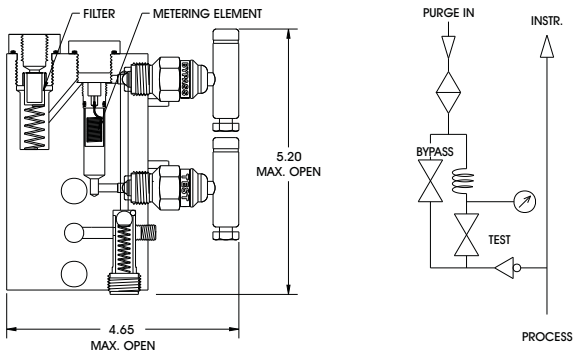
AK-062SCT *Flow & Level*



Gauges Not Included



Adjustable Check Valve Option Shown

AK-064SCT *Gauge Pressure*

Gauges Not Included

Fixed Check Valve Option Shown

FEATURES

- Fixed constant purge for gases or liquids
- A variety of flow rates available
- Built-in test valves to test purge flows
- Built-in by-pass valves to by-pass purge metering elements in order to allow for a high flow purge into the process
- Built-in filter element to protect purge metering elements
- Optional check valves to prevent back flow of process into the purge adapter in case of purge failure or process surge
- 316 SS Body
- Tungsten Carbide® ball seats
- Teflon® Pressure-Core® Stem Seal
- ½" FNPT x Flange connections

Direct-Mount™ Systems for UltraSonic Flow Meters

AK-003-C0 is used when the pressure port on the UltraSonic Transmitter is drilled directly into the body of the transmitter or if a "thread-o-let" connection is used with a flat face diameter of greater than 1.75 inches.

AK-079-C0 is used when the pressure port on the UltraSonic Transmitter has a "thread-o-let" connection with a flat face diameter less than 1.75 inches.

Gauge Siphons and Swivels

The PGI Gauge Siphon replaces the old style “Pigtail” siphon. The siphon provides a thermal barrier, protecting your instruments from harmful vapors. The siphon also reduces gauge whip, allowing closer process installation. The siphon can be used as either a freeze or steam protector when used with the proper fill fluids.

When very high heat is present, the siphon, used in conjunction with the PGI V-506 Grafoil Packed Hand Valve, reduces temperatures seen at the instrument by lengthening the condensate leg.

Teflon® Mini Pressure-Core™ Stem Seal Bonnet and Packing Design

.136" ORIFICE

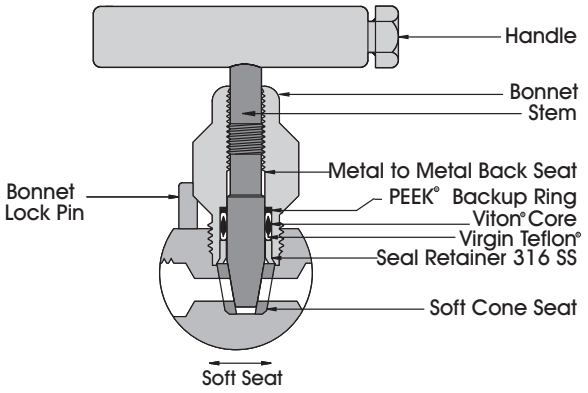
P A T E N T E D

.136" Orifice

Mini Teflon Pressure-Core vs. Conventional "Packed" Teflon®

Conventional mini packed bonnet designs are prone to stem leaks due to Teflon® seal extrusion. The packing is located above the stem threads, thus allowing the possibility of critical stem thread contamination by the process. Additionally, the soft seat area is so small that technicians can easily force the stem through the seat washer as they try to get a “firm feel” on the shut-off. Over the long run, stem and seat leaks will cause calibration and recording difficulties, as well as loss of sample product.

Mini Pressure-Core Advantages:



- HIGHLY RELIABLE Patented Pressure-Core™ Stem Seal with 5 YEAR WARRANTY
- Seal BELOW the Stem Threads
- Soft Seat Washer with FOUR TIMES the Sealing Area of a Standard Mini Seat that Provides a Seat that Can’t Be Damaged with Excessive Shutoff Force
- SAME Cv RATING (.22 Max) as the Conventional Mini Bonnet

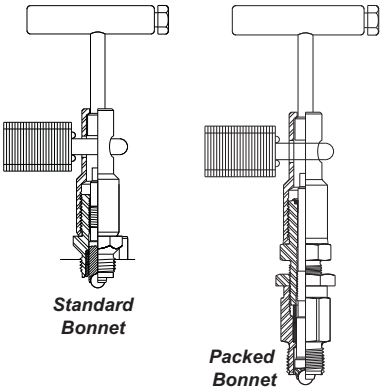
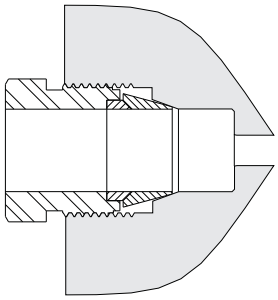
Options

Bonnet Lock Plate



The Bonnet Lock Plate provides a more positive bonnet-locking device than the standard roll pin.

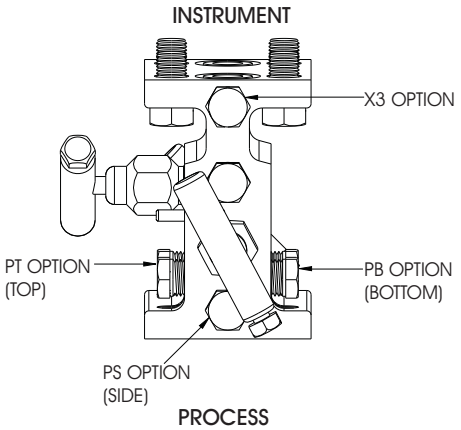
Anti-Tamper Bonnet



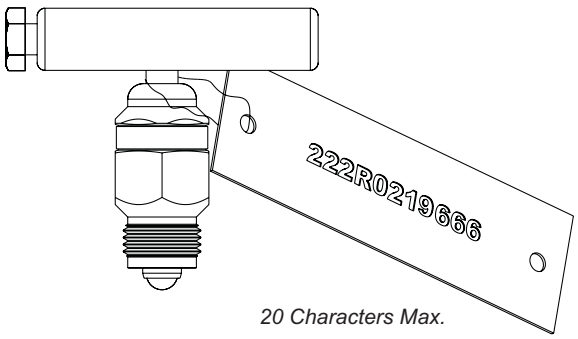
The Anti-Tamper Bonnet Handle allows the bonnet stem to be placed in any position, including open or close, before removing the handle. Without the handle, it is virtually impossible to operate the valve.

Bonnet Handle Lock-out

The Bonnet Handle Lock-out is similar to the Anti-Tamper Bonnet Handle. The bonnet stem is placed in its desired position, the handle is then raised, and the lock installed. The handle cannot be removed, and therefore cannot be lost.



Integral Tube Fitting Connection



The Integral Tube Fitting Connection is available in ½" tube only. It is optional on most manifolds and needle valves. Specify the Integral Tube Fitting Connection option to select a system which eliminates pipe threads. A variety of ferrules are available.

Warranty, Sales Policy, Special Orders and Oxygen & Chlorine Service

Product Warranty

PGI International warrants its products to be free from defects in material and/or workmanship for a period of one year from date of shipment. This guarantee is valid only if such products have been used in normal applications consistent with our recommendations. Our liability is limited to repair or replacement and no responsibility is assumed for consequential damage or expense. Any controversy arising out of the sale of PGI International products shall be determined in accordance with laws of the State of Texas.

PGI International reserves the right to change materials, specifications or designs without notice. PGI International will not be obligated to install or furnish such changes on products previously or subsequently sold.

Teflon® Pressure-Core® Stem Seal Warranty

After years of field experience and over one million valves in service, PGI International takes great pride in extending a five year limited warranty on our patented Teflon® Pressure-Core® Stem Seal System. The warranty period starts at date of purchase and extends for five full years. If within this period the Pressure-Core® Stem Seal develops a leak, PGI will provide a new bonnet and stem assembly at no cost.

PGI International will assume no consequential damages or liabilities connected with this warranty. The warranty is void if the valves have not been used in accordance with the stamped pressure / temperature ratings or if the bonnet assembly has been disassembled. The Teflon® Pressure-Core® Stem Seal is factory assembled and cannot be disassembled or inspected without damaging the seal.

Sales Policy

Our products are sold through authorized manufacturer representatives or direct from our factory sales office. All orders are subject to acceptance by PGI International, headquarters located in Houston, Texas (U.S.A.). Prices are subject to change without notice and any errors in published prices are subject to correction. No materials may be returned for credit without written authorization from our Houston office. In issuing credit for returned material, we reserve the right to direct deduct a reconditioning and handling charge. Special items, not conforming to our standard line, will not be accepted for credit.

Special Orders

PGI International has been a custom manufacturer of valve components since 1941. PGI invites inquiries for special variations on our line of valves and will work with you to solve your specific application problems.

Oxygen & Chlorine Service

To insure the quality, safety and cleanliness levels of our products, PGI International has a verifiable, environmentally controlled system of precision cleaning for Oxygen and Chlorine Service.

- Parts are cleaned with an approved liquid cleaner in an ultrasonic vibrator.
- Inspection of parts is done with an Ultraviolet light to detect contaminants such as hydrocarbons and minute particles that are not visible to the naked eye.
- Each part is tagged and heat-sealed in a double bag to prevent contamination in transit.
- **Upon completion of cleaning process, Carbon Steel Manifolds discolor to a silver-greenish sheen. This does not affect manifold performance in any way.**

INSTRUMENTATION PRODUCTS

- Instrument Valves & Manifolds
- Power and Steam Plant Valves & Manifolds

PhyMetrix®

PhyMetrix Explosion proof Moisture analyzer Model ExMa User's Manual

www.Phymetrix.com

Read this manual before using the analyzer. For personal and system safety, and for optimum product performance, make sure you thoroughly understand the contents before installing, using, or maintaining this analyzer.

Please visit our website at www.phymetrix.com for other products that may be applicable to your needs.

Every effort has been made to ensure accuracy in the contents of this manual. Should there be any doubts to the accuracy of the content please contact the manufacturer.
The contents of this manual are subject to change without notice.

The instructions, procedures, drawings, specifications and concepts contained in this manual are the property of Phymetrix Inc., and shall not be used as the basis for the manufacture or sale of apparatus or services, or reproduced or copied or transmitted in any form or by any means without written permission.

Warranty

This instrument is warranted, to the original end-user purchaser, against defects in materials and workmanship. Liability under this warranty is limited to restoring the instrument to normal operation or replacing the analyzer, at the sole discretion of the manufacturer. Batteries are specifically excluded from any liability. This warranty is effective from the date of delivery to the original purchaser. If Phymetrix determines that the equipment was defective, the warranty period is:

- one year from delivery for electronic or mechanical failures
- one year from delivery for sensor shelf life

If Phymetrix determines that the equipment was damaged by misuse, improper installation, the use of unauthorized replacement parts, or operating conditions outside the guidelines specified, the repairs are not covered under this warranty.

Normal wear and tear, parts damaged by abuse, misuse, negligence or accidents are specifically excluded from the warranty.

Purchaser acknowledges that in accepting and using this analyzer, notwithstanding any contrary term or provision in the purchaser's purchase order or otherwise, the only warranty extended by Phymetrix is the express warranty contained herein. Purchaser further acknowledges that there are no other warranties expressed or implied, including without limitation, the warranty of merchantability or fitness for a particular purpose; that there are no warranties which extend beyond the description of the face hereof; that no oral warranties, representations, or guarantees of any kind have been made by Phymetrix, its distributors or the agents of either of them, that in any way alter the terms of this warranty; that Phymetrix and its distributors shall in no event be liable for any consequential or incidental damages, including but not limited to injury to the person or property of the purchaser or others, and from other losses or expenses incurred by the purchaser arising from the use, operation, storage or maintenance of the product covered by the warranty; that Phymetrix’s liability under this warranty is restricted to repair or replacement of defective parts at Phymetrix sole option; and that Phymetrix neither assumes nor authorizes any other person to assume for it any other warranty. The warranty shall be void if serial numbers affixed to the products are removed, obliterated or defaced.

Return Policy / Procedures
If equipment malfunction is suspected or it is determined that the analyzer needs recalibration, please contact Phymetrix.
Communicate the instrument model number, serial number, application including dewpoint range being measured, and the details of the problem.
If the analyzer needs factory service you will be issued a RMA and shipping instructions.

The factory will diagnose the equipment and upon determining the problem will notify you whether the terms of the warranty cover the required repair. If the costs are not covered you will need to approve the estimated cost in order to proceed with the repair.

1 Introduction

Thank you for purchasing the state-of-the-art Phymetrix Explosion proof Moisture Analyzer model *ExMa*. This User's Manual describes the functions of this analyzer as well as the operating methods and handling precautions. There are also some sections that review general knowledge and concepts of water vapor science. Read this manual thoroughly before using the analyzer. There is a Quick Setup Manual describing the main functions and basic procedures for performing measuring operations. Check our website "www.phymetrix.com" for latest versions of documentation regarding these analyzers.
After reading this manual, keep it easily accessible for future reference. It may come in handy when there are some challenging measurements to be performed.
Conventions used in this manual:

- When using the word "*system*" in this manual we are referring to the user's system in which the moisture content is being measured. This could be a simple configuration of a pressurized gas bottle with a pressure regulator, or a complex system of dryers, filters, regulators, long tubing, valves etc.
- When referring to text that is displayed on the analyzer screen, it is presented in this manual using a font that makes it **stand out**.

The analyzer part number is displayed upon power-up and in the *About* screen, the dash numbers following the main part number signify options as follows:
-I for Explosion Proof certification, **-P** for internal pressure sensor,
-A for analog output 4/20mA, **-R** for Alarm Relays.

Check to see that your analyzer has arrived intact with all accessories that were ordered.

Model: ExMa shown with *optional* filter pressure regulator and exhaust flow meter

Save the packing materials until you have verified that there is no concealed damage, it may also be useful for future transportation.

2 Important Principles of Operation

2.1 Sensor Operating Principle

The nanopore sensor utilized in this analyzer measures the amount of water vapor molecules that have entered its pores. This amount is directly proportional to the partial water vapor pressure in the gas surrounding the sensor, and the partial water vapor pressure is dependant on the water vapor content of the gas and the total pressure of the gas. Thus to compute the water vapor content of the gas under measurement the analyzer has to “know” the total pressure of the gas. If the analyzer was purchased with the pressure sensor option then the total pressure is measured and utilized by the analyzer, if there is no built-in pressure sensor then the user should enter the total pressure into the analyzer, this can be easily done by entering atmospheric pressure (the analyzer default setting) and measuring at atmospheric pressure by allowing the outlet (exhaust) port to vent without restrictions.

2.2 Sampling Mechanism Operating Principle

The analyzer is equipped with a built-in sampling system which has the required tight seals to measure low moisture content; it consists of a stainless steel 100 micron filter and a flow control orifice, which may be placed at either the inlet(factory default) or outlet of the sampling cell or removed. The gas under measurement is exposed only to the stainless steel walls of the sampling system.

3 ⚠ Precautions ⚠

- Observe the appropriate electrical safety codes and regulations. Consult with National Electrical Code, and/or other nationally or locally recognized procedures relevant to your location.
- When measuring flammable, explosive or toxic gasses; vent the sample outlet to a safe and appropriate location.
- When measuring high pressure samples (do not exceed 5000 psia); be sure that the system is depressurized before connecting or disconnecting the sample tubing.
- Corrosives such as Ammonia, HCl and Chlorine should be avoided; H_2S and SO_2 can be present if the moisture content is below 10 PPMv.
- Avoid extreme temperatures, pressures and mechanical vibration, refer to specifications.
- Do not disassemble the analyzer.
- Do not use with contaminants and liquids, refer to section 5.2 for sample conditioning.
- Avoid exposing the sensor to ambient air as it may slowdown your next measurement.
- The ExMa is weatherproof as long as the cover is tightly closed, and the conduit ports are appropriately sealed.
- Designs with circuitry activated by relay contacts should consider noise from contact bounce, an option for debouncing is placing an appropriately rated capacitor across the relay contacts.

4 Moisture System Considerations

This section is offered as background information. There are several considerations in keeping your system at a stable and pure moisture level, free of contamination from ambient air moisture:

- The integrity of the materials isolating the pure gas from the external air, including leaks from poorly secured fittings.
- The back diffusion of moisture through the exhaust outlet, the exhausts of both the analyzer and the user system under measurement should be considered.
- The effects of temperature on the equilibrium of moisture and the surrounding materials, often observed as diurnal cycles in the measurement.

4.1 Integrity of the Materials of the User's System

Before considering the materials of a system where a specified dewpoint level must be maintained, one should review two concepts.

- Compared to the structure of solids the water molecule is much smaller. This is true compared to even the crystalline structure of metals but especially important in the polymer structure of plastics.
- Water vapor pressure in gasses obeys Dalton's law of partial pressures, which states that the overall pressure of a gas is the sum of its constituent gases. And each gas seeks to equilibrate its pressure across gradients of only its own gas pressure.

Let's consider air in a pipe at a total pressure of 100 psia, which has been dried down to -40°C dewpoint. The partial water vapor pressure in the pipe is 0.13mB. If the ambient temperature is 22°C with relative humidity of 30%, then the partial water vapor pressure in the surrounding atmosphere is 7.9mB or approximately 60 times greater than the partial water vapor pressure in the pipe. Thus even though the total pressure in the pipe is much greater that the pressure outside, the reverse is true for the water vapor pressure, and as we discussed earlier the water vapor seeks to equilibrate its pressure thus it "wants" to flow from the outside to the inside and will do so through the cracks in the joints (such as poorly tightened fittings, or NPT threads even if they are properly taped), as well as through the walls of pipes tubes and other vessels. The integrity of the system is extremely important in maintaining a stable low dewpoint; for dewpoints below -60°C always use stainless steel or PTFE, while for higher dewpoints you can use copper or galvanized steel; but never use rubber, Tygon, Nylon or other plastic tubing. Pressure regulators often use rubber diaphragms, check and if necessary replace with a stainless steel diaphragm regulator. Filter bowls should be stainless steel or glass, plastic bowls should be avoided. If a flow meter is placed at the inlet of the analyzer it should have a glass tube and be rated for the expected pressure levels, however in general it is best to place flow meters at the analyzer exhaust. Another material consideration relates to materials sealed in the system such as paper filters; these may not contribute to leaks but will greatly slow down the measurement because they will adsorb and desorb water molecules as the system dewpoint is changing.

4.2 Moisture Back Diffusion (backflow) Along the Walls of the Exhaust Tubing

The linear velocity of gas flowing in a tube is close to zero immediately along the wall of the tube. This coupled with the previously discussed "need" for the moisture to flow from the higher water vapor pressure to the lower one, allows for water molecules to flow against the total flow through the exhaust outlet into the sampling chamber of the analyzer. The fact that water

molecules are highly polar further enhances their ability to migrate against the gas flow at the sampling chamber outlet. To prevent this backflow of moisture from influencing the measurement, the analyzer should have at least 12” in length of 1/8” dia. stainless steel tubing at its exhaust port, and a minimum flow of 2 SCFH (1 SLPM) should be maintained; higher flows will produce faster equilibrium time and thus are desirable for quick measuring. A small pigtail (coiled 1/8” dia. ss. tubing 12” long) can be connected to the exhaust port of the analyzer. The short tube with attached flow meter also provides protection from back diffusion of moisture.

4.3 Temperature Dependant Equilibrium

The effect of ambient temperature on the gas partial water vapor pressure of a system can change the moisture content of the gas. This is not the temperature sensitivity of the measuring analyzer, rather the actual change of partial water vapor pressure in the user’s system due to increase in ambient temperature and thus the increase of energy of the water molecules on and in the walls of the system (tubing, vessels etc…). A typical example would be the observation of a daily cycling of the measurement in a system with tubing or other components exposed to direct sunlight. During the day as the sun transfers energy into the system, the dewpoint will appear to increase, while at night the dewpoint will appear to decrease. There may be other reasons for this daily dewpoint cycling such as the effect of sun/temperature on the efficiency of gas dryers etc. It is possible to minimize this effect using sun shields and tubing insulators. Alternatively one may study the response of the particular system to ambient temperature, by logging data over several days during different seasons, and compensating the measurements for this effect. The temperature effect will vary greatly depending on the size and materials of the system, for example stainless steel walls will have a much smaller effect than brass or copper walls.

5 Sampling Techniques

The amount of moisture measured will be influenced by the system moisture content as well as leaks in the system and transient effects of adsorption / desorption from materials in the system (as described in the previous sections).

5.1 Choosing a Measurement Site

The ExMa has been designed to perform extractive measurements. It is important to choose an appropriate sampling location that is representative of the moisture content of the system of interest.

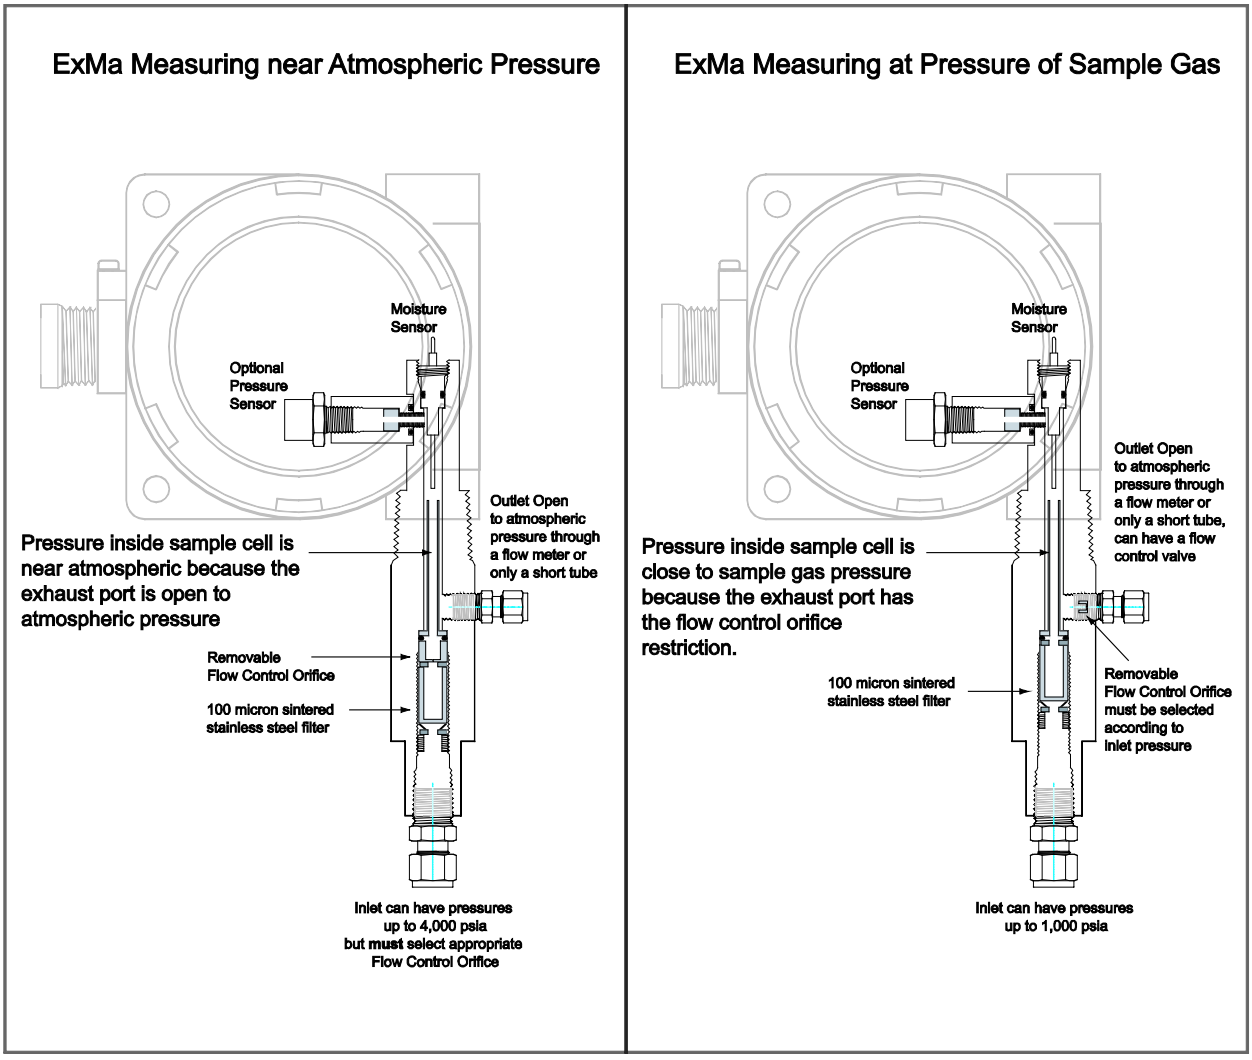
5.2 Sample Conditioning

Particulate and liquid contaminants can effect the measurement, especially the response time. Sample conditioning may be necessary to remove contaminants and improve the measurement and the longevity of the sensor. Make sure that sample conditioning components are made of suitable materials. Avoid paper or other fiber filter elements, use stainless steel instead. For expected dewpoints below -50°Cdp (39 PPMv), avoid plastic filter bowls, use stainless steel or glass instead. Drain trapped liquids from filter bowls.

If the application is suspect of possible presence of liquids for example:
• Compressed air with possible oil and/or water,
• Gas Insulated Switchgear or Transformer, SF_6 or N_2 blanket with suspected oil carryover,
• Natural Gas with possible Triethylene Glycol carryover,
Consult with Phymetrix for specialized sampling systems.

5.3 Tubing and Fittings

Make sure all tubing is constructed of materials suitable for low dewpoint measurement, i.e. stainless steel or Teflon, do not use rubber or plastic tubing (refer to section 4.1 for more details). Check for leaks after connecting.
Flow meters can be a source of moisture ingress especially if they have a plastic flow tube; ensure flow meters are connected at the analyzer exhaust, not at inlet. However metering valves should be at the inlet in order to maintain constant atmospheric pressure in the sampling chamber.



5.4 Sample Pressure

Pressure variations will effect the measurement. Higher pressure is more likely to produce condensation and thus erroneous readings or even damage the sensor. If the sample pressure needs to be reduced use a suitable pressure dropping device such as a stainless steel needle valve or pressure regulator with a stainless steel diaphragm or a flow control orifice. Make sure Joule-Thomson effects do not cool the gas below hydrocarbon and water dewpoints.

5.5 Pressure Considerations

When sampling gases from sources above 50 psia the user needs to exercise some caution.

The model **ExMa** has a built-in orifice. This orifice can be used to regulate the flow from various pressures.

• The sample cell has a built-in filter and flow control orifice at the inlet.
• On Request the orifice can be moved to the outlet to perform measurements at pressure.

The inlet orifice eliminates the need for any pressure regulators while maintaining sufficient but not excessive flows throughout the pressure rating of the analyzer.

For example 0.004” to 0.016” dia. orifices, produces flows described in the following table.

source pressure psia - (Bar)	flow SLPM 0.016” orifice	flow SLPM 0.012” orifice)	flow SLPM 0.008” orifice	flow SLPM 0.006” orifice	flow SLPM 0.004” orifice
15 - (1.03)	0.7	0.4	0.17	0.08	0.04
25 - (1.72)	2	1.3	0.6	0.3	0.1
35 - (2.4)	3	1.9	0.8	0.5	0.2
55 - (3.8)	4.8	3.0	1.4	0.7	0.3
75 - (5.2)	6.6	4.1	1.9	1.0	0.4
100 - (6.9)	8.9	5.5	2.6	1.4	0.6
150 - (10.3)	13.4	8.3	3.8	2.1	0.9
200 - (13.8)	17.9	11.0	5.1	2.7	1.1
300 - (20.7)	26.8	16.6	7.7	4.1	1.7
400 - (27.6)	35.7	22.1	10.3	5.5	2.3
500 - (34.5)	44.7	27.6	12.8	6.9	2.9
600 - (41.4)	53.6	33.1	15.4	8.2	3.4
700 - (48.3)	62.5	38.7	18.0	9.6	4.0
800 - (55.1)	71.5	44.2	20.5	11.0	4.6
900 - (62)	80.4	49.7	23.1	12.4	5.1
1000 - (68.9)	89.3	55.2	25.7	13.7	5.7
1500 - (103.4)	134.0	82.8	38.5	20.6	8.6
2000 - (137.9)	178.7	110.5	51.3	27.5	11.4

The grayed boxes are preferred operating points. Other orifices can be provided to accommodate different pressures and flows. Consult PhyMetrix support for its proper sizing.

Measuring with the ExMa, Near Atmospheric Pressure

It is recommended for most applications to perform the measurement at near atmospheric pressure. Placing the flow control orifice at the inlet and allowing the outlet to be unrestricted (other than the exhaust pigtail and flow meter), assures that the analyzer has sufficient but not excessive flow and the pressure inside the sampling chamber is near atmospheric. This approach guarantees safe conditions and eliminates the need for the optional pressure sensor. If there is no pressure sensor the analyzer can be set with atmospheric pressure 14.7psia for the **Mea. at** setting of the pressure correction (refer to section 8.3), the orifice and unrestricted outlet will guarantee repeatable conditions for all pressures within the rating of the orifice.

Measuring with the ExMa, at Pressure of Sample

If it is desired to perform the measurement at the same pressure as the sample, up to the rating of the analyzer (5000 psia standard), then place the orifice at the outlet.

The analyzer is now setup with the orifice at the outlet, thus the measuring chamber will be pressurized to the same pressure as your sample. To perform accurate measurements, you must know the pressure and enter it into the analyzer, or order the optional built-in pressure sensor which will perform the measurement and correction automatically.

6 Installation

6.1 Mechanical Installation

The ExMa can be mounted directly on the pipe or can be mounted on a panel surface and connected with tubing. Refer to Appendix A ExMa Installation Drawing.
Connections for inlet and outlet of the gas being measured are made through a variety of available options e.g. ⅛" or ¼" Swagelok® tubing compression fittings.
Refer to Mechanical Installation Drawing Appendix A.

6.2 Electrical Connections: Power, 4/20mA Analog Output, Serial I/O

6.2.1 Powering the ExMa

The ExMa has two (2) standard modes of being powered.

1) **AC powered** from 90-260 VAC 47-440 Hz
2) **DC powered** from a 12 – 24 VDC 10VA power supply

Optionally the ExMa can be ordered to also operate in **4/20mA Loop Powered** mode.

Refer to the **ExMa Electrical Connection** diagram in Appendix B for the various power modes and the specific wiring for each mode.

6.2.2 Analog Output 4/20mA

The ExMa has an isolated 4/20mA output, which may be connected as a sink in configurations where the power is provided externally, or if the ExMa is actively powered (modes 1&2) the 4/20mA can be configured to source the current.
Refer to the **ExMa Electrical Connection** diagram in Appendix B for the 4/20mA configurations and specific wiring for each.
The ExMa status bar will have an **Analog Output Loop Open** message if the 4/20mA output is not connected. The user menus allow the user to force the 4/20mA output to known values for purposes of testing and calibrating the 4/20mA interface, refer to section 8.5.

6.2.3 ExMa HART interface

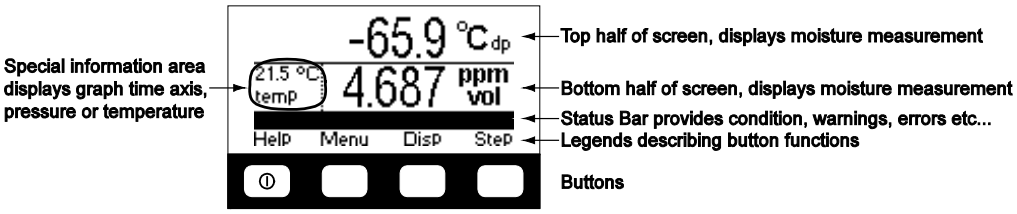
The ExMa is equipped with a HART interface which overlays digital signals on the 4-20mA loop current. Thus the ExMa can be used in any 4-20mA loop and can simultaneously communicate digitally on the same two wires.
The ExMa responds to all of the HART Universal (Common Practice) Commands as well as some important setup and configuration commands.

When wiring the ExMa for use with HART make sure that there is sufficient resistance between the power supply and the ExMa 4/20 interface. Usually there is a 250 Ohm resistor used for sensing the current this is adequate to provide the proper impedance isolation for HART modems to operate properly.

HART Commands Implemented in the ExMa

HART Command		Description	
#	**Name**		
0	Read Unique Identifier	Read Device identification such as address, manufacturer, revision level etc.	
1	Read Primary Variable	Read the measurement of the Primary Variable (P.V.)	
2	Read Current and % of range	Read the current that is produced by the Primary Variable and the percent of range it represents. These depend on the command #51 measurement assigned to the P.V., the value of that measurement and the assignments of command #35.	
3	Read Dynamic Variables and P.V. current	Read the measurements of up to 4 measurement variables as assigned by command # 51.	
6	Write Polling Address	Assign a polling address to a device. An address (1-15) puts the device in fixed 4mA mode for multidrop connectivity. Address 0 puts the device in 4/20mA mode.	
11	Read Unique Identifier Associated with Tag	Find device that has the desired textual Tag assigned by command # 18.	
12	Read Message	Read information written by command # 17.	
13	Read Tag, Descriptor and Date	Read information written by command # 18.	
14	Read P.V. Sensor Information	Information on primary sensor Serial Number, range etc.	
15	Read P.V. Output Setup	Analog output range, alarms etc.	
16	Read Final Assembly Number	Read number written by command # 19.	
17	Write Message	For use by owner/operator to identify the device and its use.	
18	Write Tag, Descriptor and Date	For use by owner/operator to identify the device and its use. Can search for the Tag, with command # 11, on multidrop connections.	
19	Write Final Assembly Number	For use by owner/operator to identify the device and its use.	
35	Write Primary Variable Range Values	Setup the measurement units and values that correspond to 4mA and 20mA output of the loop.	
40	Analog Out Fixed	Forces the Analog Output DAC to a specified value.	
44	Write Primary Variable Units	Select the units of measure for the Primary Variable.	
45	Trim DAC Zero	Trims the DAC Zero by difference of Cmnd. #40 and observed value.	
46	Trim DAC Gain	Trims the DAC Gain by ratio of Cmnd. #40 and observed value.	
50	Read Dynamic Variable Assignments	Read the assignments of command # 51.	Measurement Variables and [available units]: 00 – Moisture Measurement °C & °F dewpoint, ppmV, mB H_2O vapor pressure, grams of H_2O / m^3 and Lbs H_2O /10^6 standard cubic feet in Natural Gas 01 – Temperature of Gas [°C, °F] 02 – Temperature of Board [°C, °F] 03 – Pressure [psi, bar, mbar, kg/sqcm, pascal …] 08 – Loop Voltage [mV] 09 – Status Bits
51	Write Dynamic Variable Assignments	Assign Measurement Variables to each of the four primary variables reported by the analyzer by command # 3.	
53	Write Transmitter Variable Units	Select Units of measure for each of the Variables.	
108	Write Burst Command Number	Select command number to burst.	
109	Burst Mode Control	Enable/Disable burst (continuous) transmissions.	

A free of charge program may be downloaded from our website www.phymetrix.com that allows communicating with the ExMa HART interface.



The ExMa HART interface Address is the Instrument Serial Number which can be seen in the About menu. The ExMa can be set up to operate in HART polling mode by selecting a polling address 1-15 in the **HART** user interface menu, in this mode multiple (up to 15) ExMa's or other HART devices can communicate on the same loop but each device consumes only 4mA.

6.2.4 Serial I/O RS485/RS-422

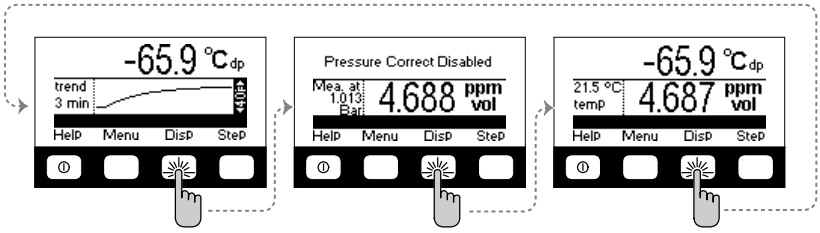
The ExMa can optionally provide a RS-485/422 interface in power modes 1 and 2. Refer to the ExMa Electrical Connection diagram in Appendix B for connections. The default communication port settings are 19200, E, 7, 2; however they can be modified in the **COMs** user interface menu.

7 User Interface Overview

The analyzer user interface consists of a backlit graphic LCD display, an audio sounder and four touch areas on the glass cover of the explosion proof enclosure. These touch areas provide the button functions which are dependant on the required selection choices, thus appropriate legends appear on the display immediately above the touch areas. For ease of discussion we will refer to these touch areas as "buttons" in the rest of the user's manual. To "press" a button, the user must touch the appropriate ***metal colored oval area*** on the glass with a finger. It may be necessary to press the finger firmly on the glass to get a wide contact area. When a button is activated a small light will be illuminated immediately above the touch area.

Note: A personal computer Virtual Analyzer program is available on our website (www.phymetrix.com) allowing the user to familiarize themselves with the user interface and train on its operation.

Note that the analyzer distinguishes between long and short presses of the glass touch areas (buttons). Normally to operate the analyzer one must perform short presses (less than 1 second), the button must be released after the beep.



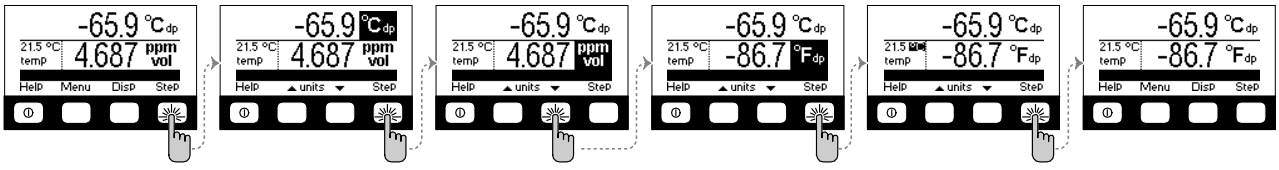
8 Operating the Analyzer

Performing measurements with the analyzer is a simple process:

- Connect the sample gas to the analyzer (refer to section 5.2 and section 6.1)
- Connect Power and Signals to the analyzer (refer to section 6.2)
- If possible adjust the flow of the gas to be greater than 1 LPM (2 SCFH)
- Select the graphing display mode
- Observe the reading once the graph is stable
- Change the display mode if desired

8.1 The Display Mode

Once powered, the analyzer will enter one of three display modes (whichever was last used) that show the measurements performed by the analyzer. Pressing the **Disp** button will change the display mode. Use the mode best suited for your application.



- Dewpoint Units and Graph of the measured dewpoint in the last 90 minutes is displayed. The graph span (Y-axis above shown 40°Fdp) will automatically resize to accommodate the minimum and maximum measurements in the last 90 minutes. Select between 90 or 3 minute time axis by choosing *Continuous* or *Spot* measurement modes in the **Mode Of Use** option available in **MENU-2**.
- Pressure corrected and at pressure measurements, as well as the gas pressure in the sampling chamber is displayed. The pressure correction selection in this display mode will be also utilized in the other two display modes. If pressure correction is enabled, then the status bar will provide an indication in all three display modes, so that the user is made aware that the displayed measurement is pressure corrected. In the example shown above, the pressure correction is disabled.
- Dual Dewpoint Units and Temperature of gas under measurement is displayed. Allows the user to view the measurement in two different units as well as the temperature in the sampling chamber. In the right most screen in the example above the moisture content is being viewed in °C and in ppm by volume, while the temperature is displayed to be 21.5°C.

8.2 Units to Display the Measurement

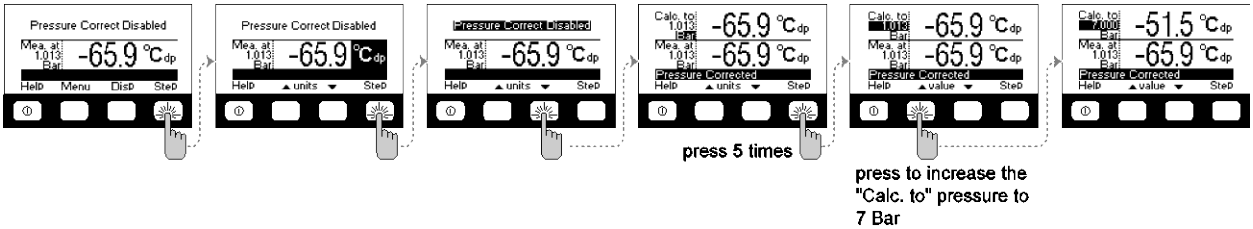
Measuring water vapor content in gasses presents many challenges not the least of which is understanding the units of measuring. Different industries require different units of measure for various reasons some technical some historical. The units typically used are in several categories:

a) The ratio of the volume occupied by the water vapor to the volume occupied by the other gasses in the mixture. These measurements are expressed in Parts Per Million by volume **PPMv**, or Parts Per Billion by volume **PPBv**, or Volume Concentration %.
b) The ratio of the weight of the water vapor to the weight of the other gasses in the mixture. These measurements are usually expressed in Parts Per Million by weight **PPMw**.
c) The density of water vapor in the mixture of gasses, is the ratio of the weight of the water vapor to the volume occupied (at atmospheric pressure) by the total mixture of gasses. These measurements are expressed in grams per cubic meter (**g/m^3**), or pounds of water per million standard cubic feet (**$LbsH_2O/MMSCF$**).
d) The partial vapor pressure of water vapor – the pressure exerted by the water vapor only, without considering the other gasses in the mixture. These measurements are expressed in units of pressure such a **microBar**, mmHg, or any other pressure units that may be convenient.
e) The dewpoint of the gas mixture - the temperature at which the water vapor in the gas is saturated. This means that if the gas temperature was above the dewpoint temperature and contained water only in vapor form, then if the gas is cooled, when it reaches the dewpoint temperature the water vapor will just start to form condensation. Dewpoint measurements are expressed in units of temperature such as **°C** or **°F**.
There are other measurement categories for expressing water vapor content in gasses however they are not central in the context of this analyzer, and are listed for completeness: Relative Humidity, Mixing Ratio, Absolute Humidity, Humid Volume of Air, Weight concentration %, Delta Dewpoint. Freeware programs compatible with Microsoft® Windows, as well as with Apple and Android smart-phones, are available for downloading at www.phymetrix.com facilitating easy conversions between the above categories of units of measure.
In this analyzer, moisture content of the gas being measured can be displayed in a variety of units: °C & °F dewpoint, ppmV, ppmW, µB H_2O vapor pressure, grams of H_2O / m^3, and Lbs H_2O /10^6 standard cubic feet in Natural Gas. Use the **Step** button (right most) to highlight the units of the measurement and use the ▲ and ▼ buttons to change the units to the desired values. If the instrument is unlocked then the unit changes will be permanent even after the analyzer is powered OFF.

The following diagram depicts the button presses required to change the units in which the measurement is displayed on the bottom half of the screen from ppmV to °F.

Similarly the units for the top half of the screen or the temperature can be changed.
If the instrument is locked then the change will last for 5 seconds so the newly selected units can be viewed, then the selection will revert to the original units. The status bar will indicate **Locked-change is temporary** and will produce beeping sounds.

8.3 Pressure Correction



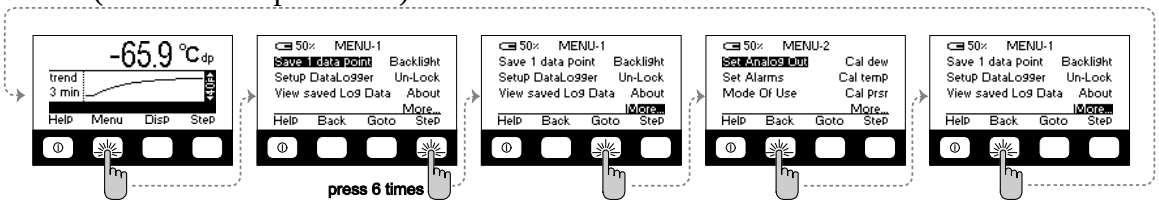
In the previous section the summary of the units of measure for water vapor content reveals that the units can be organized in three groups:

1) Proportion of water vapor in the gas is measured in several different categories such as PPMv, PPMw, or LbsH_2O/MMSCF.
2) Pressure exerted by the water vapor.
3) Temperature at which the water vapor is saturated in the gas.

The measurements of group 1 are most intuitive as they can be visualized as a proportion of water in a gas mixture. These units are independent of the pressure of the gas that is being described. For example if we say that the gas has seven pounds of water per million standard cubic feet, we are describing the water content irrelevant of the pressure at which the gas may be. The measurements in group 2 are in units of pressure and may at first seem an unusual way of measuring content but if we recall Dalton's Law of gases it becomes evident of the usefulness of this means of expressing water vapor content in gasses. Note however that if the total gas pressure is increased the partial water vapor pressure will also increase, thus the content of water vapor in a gas is not fully described by the partial water vapor pressure – we would also need to specify the total pressure of the gas mixture.
The measurements in group 3 are units of temperature, describing the water vapor saturation temperature in the gas mixture. This method of expressing water vapor content is also affected by the total pressure; if the total pressure is increased the gas will become saturated at a higher temperature. Thus we would also need to know the total pressure of the gas mixture in order to describe its water vapor content with dewpoint units.

As we discussed earlier this analyzer measures the partial water vapor pressure in the gas and computes the water vapor content in the chosen measurement units to display on its screen. To make this computation the analyzer software needs to "know" the total gas pressure. This pressure can be automatically measured by the optional internal pressure sensor, or if the analyzer was not purchased with that option then the pressure can be entered by the user. To simplify operation the user can enter atmospheric pressure and measure at atmospheric pressure by allowing the exhaust of the analyzer to be unobstructed.

Lets consider an example where the gas under test is measured at atmospheric pressure, however the gas is in a pipeline at much higher pressure, and the user wants to know if there could be water condensation in the pipe. Reading the dewpoint at atmospheric pressure does not allow us to compare it to the expected low ambient temperature in order to determine if condensation will occur; we would need to know the dewpoint at the same pressure as is present in the pipeline. The analyzer can compute this dewpoint by having its Pressure Correction feature enabled, and having the user enter the pressure in the pipeline. This can be done by pressing the **Disp** button until the analyzer displays the Pressure correct mode. By factory default the pressure correction is disabled.



The above diagram depicts the steps required to enable the pressure correction and set up the "Calculated to" pressure to 7 Bar (about 100 psia). This example shows the analyzer measuring

the gas at atmospheric pressure (1.013 Bar) to have a dewpoint of -69.5°C, and calculating that the same gas when at 7 Bar will have a dewpoint of -51.5°C.
If the user switches to the Graphing or Dual Units display mode, the displayed measurements will be -51.5°C; there will be a reminder that the computation is being performed with the status bar message **Pressure Corrected**.

To disable the pressure correction computation; while in the Pressure Correct display mode, press the **Step** button until the **Calc.to** pressure *units* are highlighted, and then press the ▲ or ▼ button until the **Pressure Correct Disabled** message appears on the top half of the screen.

8.4 Navigating Through the Menus

While in any of the three display mode screens, press the **Menu** button to go to the **MENU-1** screen. This screen contains seven options; the last one is labeled **More…** press the **Step** button six times until the **More…** option is highlighted, then press the **Goto** button to go to the **MENU-2** screen (refer to example below).

Similarly by accessing the **More…** option of **MENU-2** will navigate to **MENU-3**.
While in **MENU-3** to go back to **MENU-2** press the **Back** button. Similarly navigate back to the **MENU-1** screen and back to the display screen.
If the analyzer is left in any of the MENU modes and the buttons are not pressed for 3 minutes then it will revert back to the display screen.
While in any of the MENU screens press the **Step** button until the desired option is highlighted, then press the **Goto** button to enter the edit / view mode for that option.

8.5 The Functions Available in the Menus

MENU-1

Save 1 Data Point or Start-Stop Log

If Data Logging is setup for *Single Point* logging then this menu choice allows the user to save a single point in the log. If the setup is for *Continuous* logging then this menu choice allows the user to start or stop the logging. In both cases the user can choose the id tag associated with the measurement. *Refer to Data Logging section for more details.*

Setup DataLogger

This menu choice allows the user to select the logging mode to be either *Single Point* or *Continuous*, in addition in the continuous mode it allows selecting the sampling period and the total number of samples to be saved.

View saved Log Data

This menu choice allows viewing the logged data on the analyzer.

Backlight

This menu choice is provided for commonality with portable analyzers that have the ability of selecting the intensity of the backlight, it serves no purpose in the on-line analyzer.

Un-Lock

This menu choice allows the user to lock or unlock the analyzer. The user can setup the analyzer, using the PhyAI.exe program, to require a password in order to unlock it or can allow unlocking without a password. A locked analyzer will prevent the operator from making permanent changes.

About

This menu choice provides information regarding the software version and copyright, as well as the analyzer and sensor serial numbers. In addition the date when the analyzer was last calibrated is displayed.

MENU-2

Set Analog Out

For analyzers equipped with the analog 4/20mA output option this menu choice allows setting the measured dewpoint that will correspond to the 4mA and the 20mA values, as well as testing the analog output interface.

Set Alarms

For analyzers equipped with Alarm Relays this menu choice allows setting the alarm relays.

Mode Of Use

This menu choice allows selecting either *SpotCheck* or *Continuous* modes of operation. Use the **Sel** button to switch between modes of operation. In the *SpotCheck* mode the measurement graph spans 3 minutes to indicate if the reading is stable. When the line seems flattened the reading can be taken. In the *Continuous* mode the measurement graph spans 90 minutes to indicate the recent history of the measurement.

Cal Dew

This menu choice allows the user to enter a single calibration point, by exposing the analyzer to a gas with a known dewpoint and enter that dewpoint value to create a single point calibration. For Analyzers equipped with a Self Calibrating Solenoid Valve, this menu choice allows the user to setup the self calibrating schedule.

Cal Temp

This menu choice allows setting the slope and offset for calibrating the two temperature sensors in the analyzer. ‘Td’ is the temperature sensor located at the dewpoint sampling chamber and measures the temperature of the gas being sampled. ‘Tb’ is the temperature sensor located on the circuit board.

Cal Prsr

This menu choice allows setting the slope and offset for calibrating the optional pressure sensor which measures the pressure of the gas in the sampling chamber.

MENU-3

Lockable Items

This menu choice allows selecting which items can be locked.

Status Bar

This menu choice allows selecting the items that will be displayed on the status bar.

Time-Date

This menu option allows setting the battery-backed clock calendar.

Autoshutoff

This menu choice is provided for commonality with portable analyzers that have battery saver shutoff.

PPMw factors

This menu choice allows the user to select the method of PPMw computations. The user can select measurement in gas and the molecular weight of the gas, or measurement in liquid and Henry's constant associated with the liquid.

Language de fr es

This menu choice allows the user the select the language in which the analyzer menus appear. Available languages are English, German, French and Spanish.

MENU-4

COMs

This menu choice allows setting the communications port for analyzers that have serial communications RS-485/422 output options.

Dig. Out PWM

This menu choice is provided for controlling the pulse width modulation of digital outputs such as relays or solenoids in order to facilitate power savings.

Set Thermostat

This menu choice is provided for on-line analyzers equipped with sample heating for controlling the temperature of an enclosure.

HART

This menu choice allows selecting the HART polling address.

9 Data Logging

The analyzer has a built-in memory capable of storing data. The data can be stored in one of two modes, *Single Point* or *Continuous*.

Single Point data can be viewed on the analyzer screen. A personal computer Microsoft Windows® compatible program PhyAI.exe is available, which allows the user to view and/or erase the *Single Point* or *Continuous* data in the analyzer's memory.

The user can choose the mode (*Single Point* or *Continuous*) of how data should be logged from the **Setup DataLogger** option available on **MENU-1**.

In addition the analyzer can be connected via its serial port or HART interface to a personal computer. By using the PhyAI.exe program, the analyzer can continuously transmit its real-time measurements to an MS Excel® spreadsheet to log the data directly to the PC disk drive as well as plot it in real time. This method of data logging may be useful in stationary measurement installations, or portable uses (with a laptop computer) requiring very large amounts of data logging.

Continuous data logging is useful in studying the moisture content, temperature and pressure of the gas being measured over a long period of time. The analyzer can store over 4000 points of

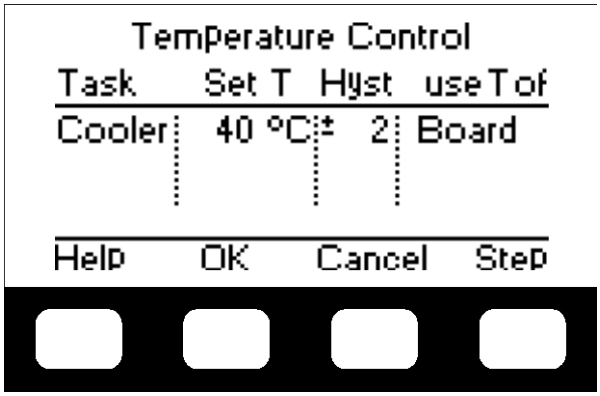
data, at a user selectable period (5 seconds to 1275 seconds), thus data can be gathered with very fine resolution or with coarser resolution that can record data for approximately 2 months. The total number of points to be logged can be limited to be less that the total free memory as to conserve it for other use. When deciding on the choice of sampling period and total number of data points to capture; consider the response time of the system in which the moisture content is being measured as well as what is the desired total time for which data has to be logged.
The **Setup DataLogger** option available on **MENU-1** allows the user to choose the Log type to be *Continuous* and then to choose the period (in 5 second increments up to 1275 seconds). As the period is modified the analyzer will compute and display the total free records in the memory and the amount of time that the data can be logged for using the currently selected period. The user can also set a limit for the total number of points to be logged depending on the requirements of the application.
Once the analyzer is setup for *Continuous* data logging, the logging can be started from the **Start-Stop Log** option available on **MENU-1**. While *Continuous* data logging is running there will be an indication on the status bar "Logging Data".

9.1 Retrieving the Data / Clearing the Memory

To retrieve the data from the analyzer memory, it is required to install the PhyAI.exe program on a Microsoft Windows® compatible personal computer with a serial port. Single point data log can be viewed on the analyzer screen from the **View saved Log Data** option available on the **MENU-1**.

9.2 Logging Data Directly into a Personal Computer

The PhyAI.exe program allows the user to log data in real time directly into Excel 2003 via the OLE interface and plot the data in an excel graph. Excel 2007 will also perform data logging however when prompted from the PhyAI program to automatically plot dual axis graphs it will plot only single axis graphs, all other functions will operate properly, dual axis graphs can be plotted manually.



10 Single Point Calibration

If necessary to adjust the measurement without having to send the analyzer for recalibration, the user can expose the analyzer to a gas with a known moisture content. The known value can be entered into the program and the analyzer can be set to adjust the measured value such that the reported value is equal to the known moisture content of the gas. Once the single Point Calibration is performed, this adjustment will be applied as a constant offset on the full range of the measurement as long as the Single Point Calibration is enabled; the user can at any time disable or enable this calibration point or perform a new single point calibration (changes can be made only when unlocked.) In order to alert the user that the measured value is being adjusted, the status bar will provide an indication when the Single Point Calibration is being applied. When the single Point Calibration is disabled the analyzer will compute the measurements per original factory settings.
Caution! Before a calibration is performed the user should be absolutely certain of the moisture content of the gas that the analyzer is being exposed to. It is also very important that the analyzer is allowed sufficient time to equilibrate with the gas of known moisture content, which can be determined by observing a flat graph line in the continuous mode of measurement.

11 Using the ExMa for temperature control

When the ExMa is installed in an enclosure (for example in a sample system) it can be equipped such that it can control an enclosure heater and or cooler. These functions are controlled through the **Set Thermostat** menu choice in **MENU-4**.

If either a cooler or heater or both are installed, the appropriate fields in this menu will allow the user to select the temperature for each item and hysteresis for cooler, as well as which temperature sensor to use for controlling the temperature (sample gas or circuit board).
The cooler is controlled as a thermostat, while the Heater control is PID.
This menu has up to two rows of data, one for cooler and one for heater, if installed.
For each there are four columns of parameters that may be modified. The *temperature*, the *units* of the temperature, *hysteresis* (for cooler only) and which *temperature sensor* to use.
For example if in the Cooler row the selections are **40 °C +/-2 Board**, this means that when the board temperature sensor exceeds 42°C the cooler solenoid will be energized, and when the board temperature is below 38°C the cooler solenoid will be de-energized.
Use the **Step** key to move the highlight over the parameter that needs to be changed, and then use ▲ or ▼ to change the parameter. To finish, press the **Step** key until there are no highlights. Press the **OK** key so that the analyzer saves the selection or press the **Cancel** key if you are not sure about the selections and would like to leave the menu without making any changes.

12 Troubleshooting and Maintenance

This analyzer is designed to be maintenance and trouble free. However should problems occur due to process conditions or other factors, use this chapter for troubleshooting purposes. If the encountered circumstances are not discussed in this manual please contact Phymetrix. Spare parts may be ordered through Phymetrix.

12.1 Cleaning

The analyzer enclosure may be cleaned using a moist cloth.
The flow control orifice of the ExMa can be removed and cleaned with solvents.
The sensor is not user serviceable and should not be cleaned by the user. If it is contaminated please acquire an RMA and send the analyzer for repair.

12.2 Self Diagnostics

The analyzer constantly performs self diagnostics to determine if all parts are operating properly. The results of the diagnostics are displayed on the status bar.

Table 1 Status Bar Messages

Status bar Message	Meaning
Pressure Corrected	The analyzer is computing the moisture measurement using pressure correction
AO frozen	The Analog output (4/20mA) is being kept frozen (unchanging) by some part of the program.
Single Point Cal Enabled	Single point calibrations are being performed. Can be disabled from the Cal dew function in MENU-2
Logging Data	The continuous data logging is enabled and running.
Calibration Past Due	The analyzer compared the date since the last calibration to the date in the battery backed clock/calendar and computed that the time exceeded the settings of the number of months between recalibrations.
Max Pressure Exceeded	The pressure sensor inside the sampling chamber is measuring more than rated pressure of the pressure sensor.
Temperature Sensor Error	One or both of the temperature sensors are not operating properly, cable unplugged etc.
Pressure Sensor Error	The pressure sensor is not operating properly, cable unplugged etc.
Analog Output Loop Open	The analog output is not connected to a proper source.
Battery Low	The battery needs to be recharged.
Temp Range Exceeded	The temperature exceeds +70°C
Sensor Range Exceeded	The moisture sensor measurement exceeds the preprogrammed parameters.
Sensor Msr Err=x	The moisture sensor measuring circuit has detected an error.

12.3 Suspected Erroneous Measurements

Some of the most common suspected erroneous conditions are listed in the following table included are common reasons and suggested remedies.

If the measurement is suspected to be erroneous, before calling for support, it may be helpful to have the following information:

- Type of gas being measured.
- Expected dewpoint.
- Nominal pressure (consider back pressure).
- Nominal temperature.
- Nominal flow rate though the analyzer.
- Flow diagram or description of system, showing items and their materials of construction. Include materials of filer elements, regulator diaphragms, and valve seats.
- Possible contaminants (particulates, liquids, oil, glycol, cleaning solutions, etc.).
- Are the pipes and analyzer purged before measuring? How long? Flow rate? With the same gas that will be measured?
- If other equipment was used to verify the dewpoint, what is the equipment (include model number)? What is its specified measuring range? When was it last calibrated/certified?
- If using bottled gas for reference: Manufacturer? Content and accuracy markings? What is the pressure in the bottle at time of comparison? What is the ambient temperature where the bottle is stored? What are the materials of construction of the pressure regulator, especially the diaphragm?

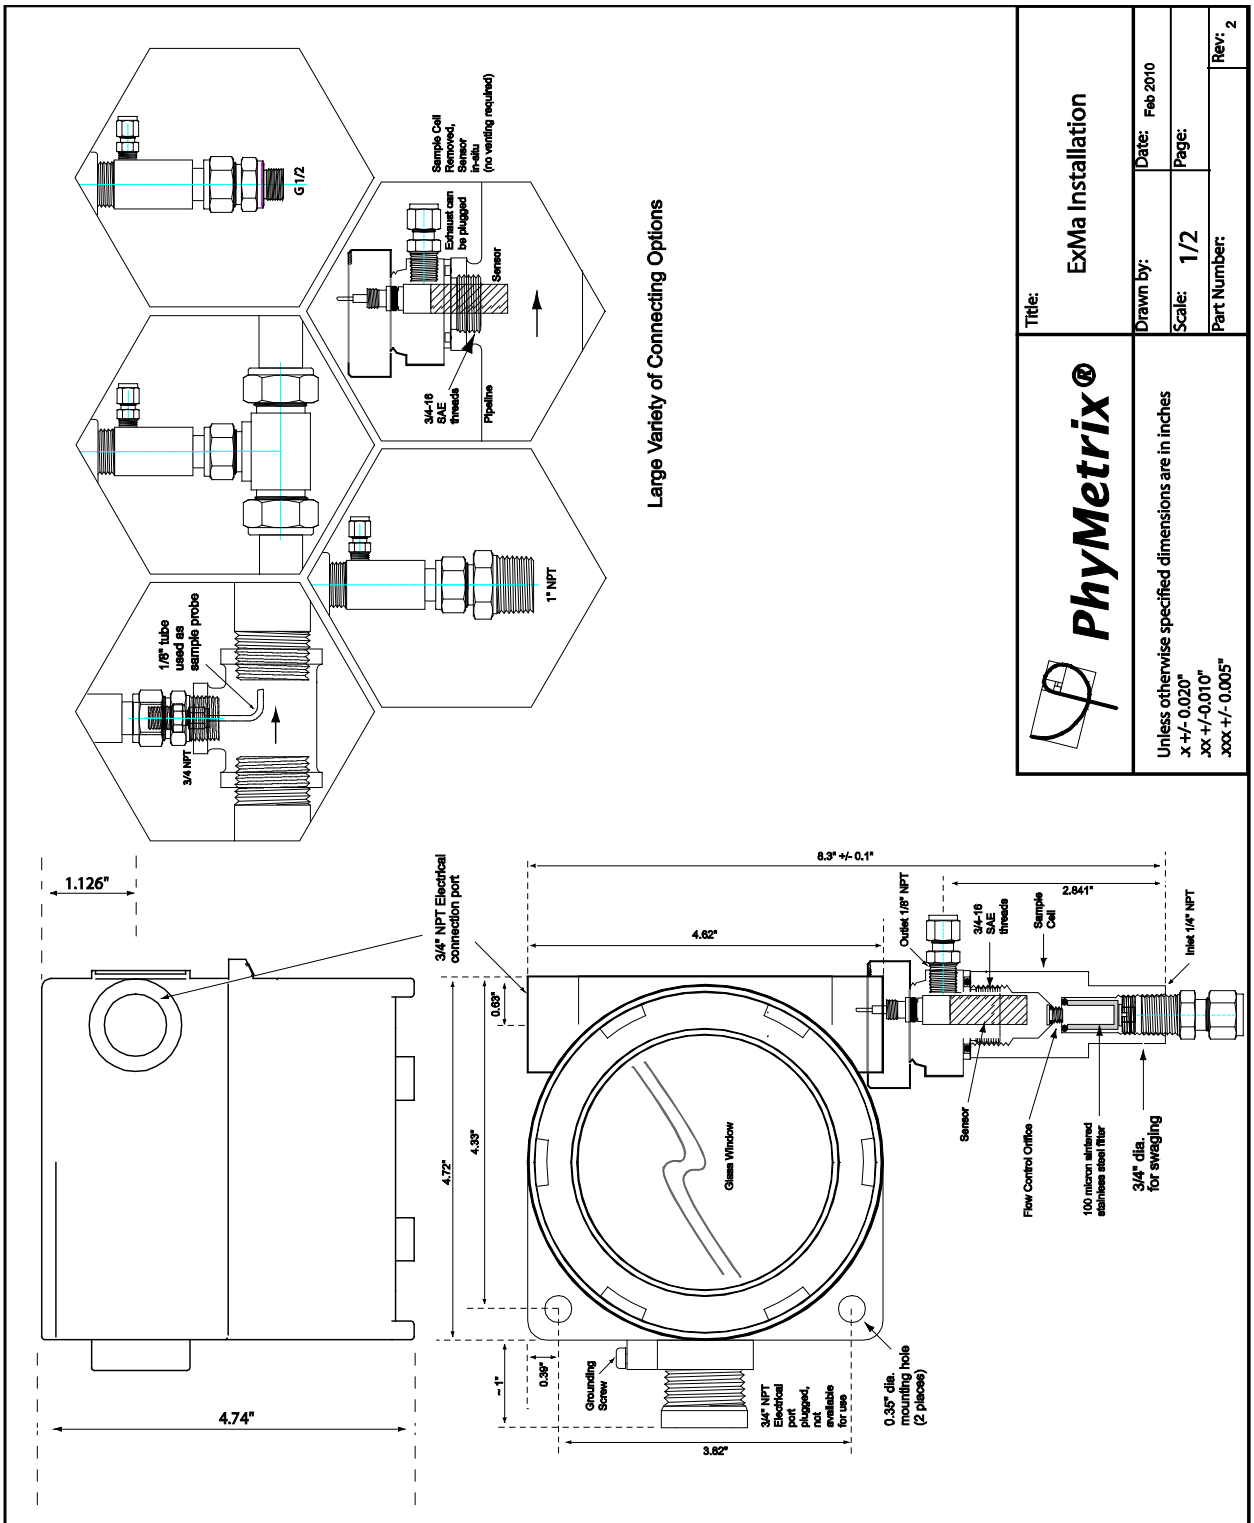


Table 2 Guide to Troubleshooting Measurements

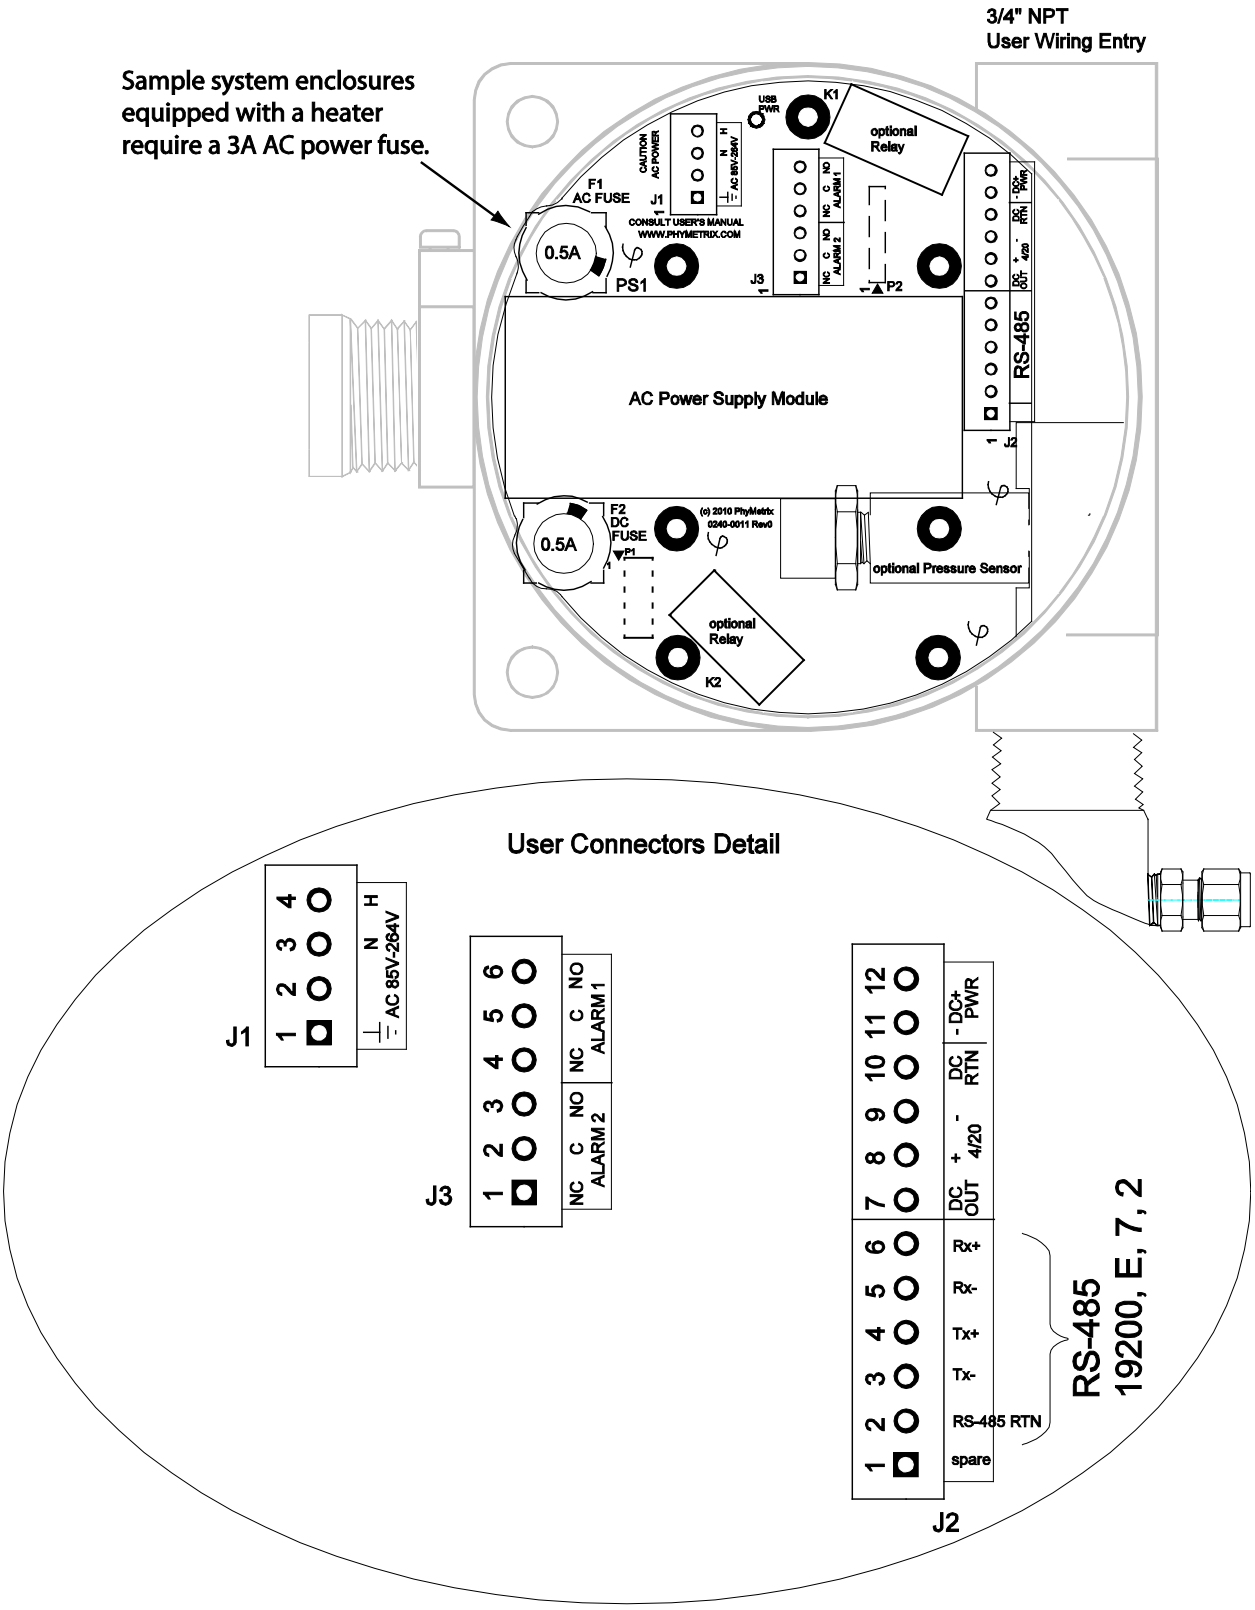
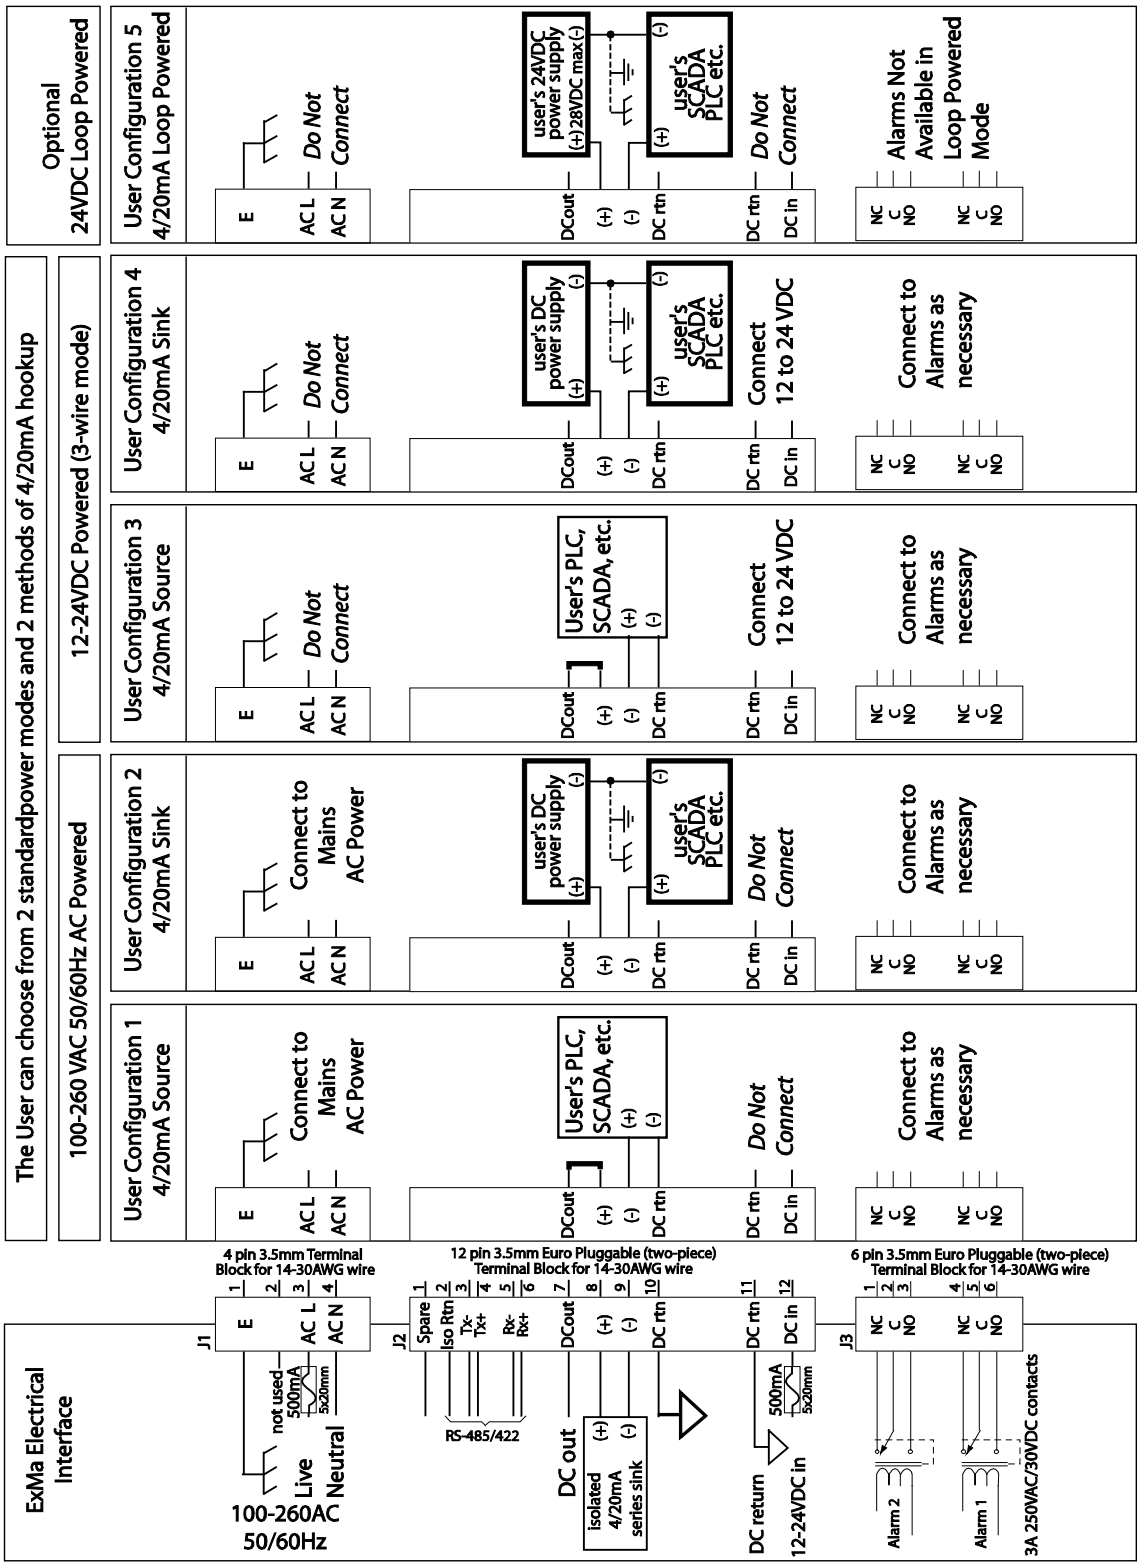
Problem or Unexpected Observation Behavior	Likely Source of Problem	Analysis	Remedy
Measurement is **dryer** than is expected.	Equilibrium	Before concluding that there is an incorrect measurement, make sure that the system is at equilibrium.	Use the graph display and wait for equilibrium.
	Sampling point	Consider if the sampling point could be dryer than the rest of the system.	If necessary find a more appropriate sample point
	Damage Corrosion, abrasion	Contaminants can damage the sensor.	Refer to sections: 3 Precautions and 5.2 Sample conditioning.
	Needs recalibration	Depending on the application recalibration may be yearly or in 5 years.	Consult with factory.
Measurement is **wetter** than is expected.	Equilibrium	Before concluding that there is an incorrect measurement, make sure that the system is at equilibrium.	Use the graph display and wait for equilibrium.
	Sampling point	Consider if the sampling point could be wetter than the rest of the system.	If necessary find a more appropriate sample point
	Condensation	Refer to the "Measurement is **not changing**" observation below	
	Damage Corrosion, abrasion	Contaminants can damage the sensor.	Refer to sections: 3 Precautions and 5.2 Sample conditioning.
	Incompatible materials in system with low dewpoint.	Refer to section 4.1 Integrity of the materials of the system.	Replace inappropriate materials.
	Leaks	Check for leaks around all interconnections.	Tighten fittings. Repair the leaks.
	Needs recalibration	Depending on the application recalibration may be yearly or in 5 years.	Consult with factory.
Measurement is changing **slower** than expected.	Equilibrium	The rate at which the system will reach equilibrium depends on the system particulars, such at ambient temperature, internal pressure, flow rates, system materials of construction, surface area of system internals.	Previous experience may be indicative of the system response time. It is common for systems to take hours to equilibrate.
	Sampling point	Is the sampling point in the direct flow of the system gas, or is it at a dead end of the distribution system?	Sample in the direct flow.
	Contamination	Are there hygroscopic contaminants?	Clean the sensor and install filters.
	Out-gassing	Are there materials in the system that could be out-gassing?	Replace the hygroscopic materials.
	Leaks	Check for leaks around all interconnections.	Tighten fittings. Repair the leaks.
	Large diameter sampling tubing	Larger diameter tubing have larger surfaces.	Use smallest practical tubing diameter, 1/8" recommended
	Low flow rate	Response time is normally greatly influenced by flow rate, but if the measurement value is influenced by flow rate there may be a leak.	Flow rate should be greater than 1 LPM.
Measurement is **not changing**, always shows a dewpoint close to ambient temperature.	Condensation	Condensation may have occurred from a slug of water or from previous conditions where the gas dewpoint was greater than the ambient temperature. Condensation typically accumulates in filter bowls or other low points in the system. Then evaporates and produces a high dewpoint.	Drain the condensate and allow the system to dry down.
Measurement has a **daily cycle**	Thermally induced water vapor pressure change.	Refer to section 4.3 Temperature dependant equilibrium	

13 Specifications for Model ExMa

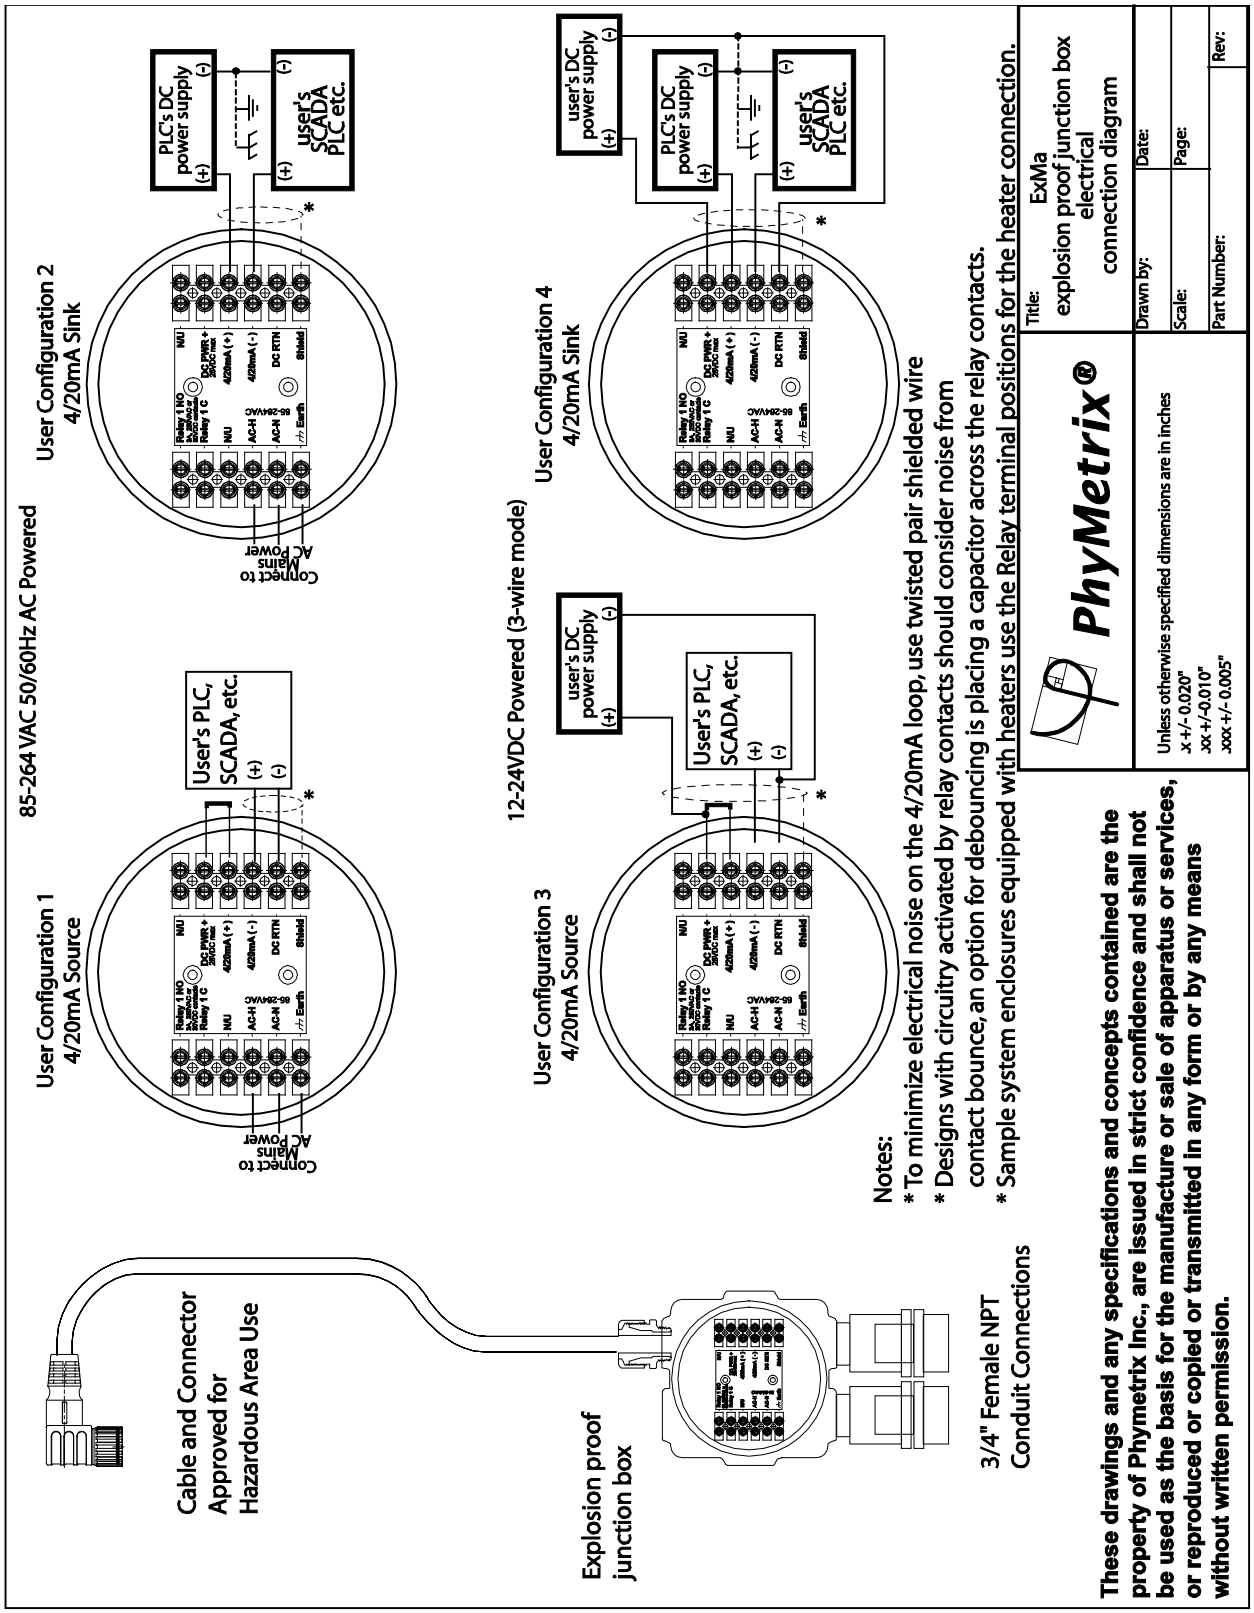


Temperature Range	ExMa Analyzer: -20°C to +60°C Electronics: -40°C to +85°C Moisture Sensor: -20°C to +60°C Pressure Sensor: -20°C to +85°C LCD operating: -20°C to +70°C storage: -30°C to +80°C
Moisture Sensor	Range -110°C to +20°C Accuracy: ±2°C temperature corrected Repeatability: 0.8°C Response time: 95% of step change in 3 min. Sample flow: >1 LPM
Temperature Sensors	-40°C to +70°C ±2°C
Pressure Sensor	2 to 1000 PSIA ±1%, 316L stainless steel wetted parts (higher pressures can be ordered)
Electrical	3 automatic detection - self configuring power modes: 1) 90-260VAC 47-440Hz or 2) 12-24VDC 10VA or 3) 4/20mA Loop Powered Power modes 1 or 2 have the following optional I/O: a) RS-422/485 isolated b) 4/20mA sink or source; isolated; with HART® c) 3 Alarm Relays - 3A, 250VAC / 30VDC contacts
Mechanical	3/4" OD tube and 1/4" NPTF Inlet, 1/8" NPTF Outlet All 316 Stainless Steel wetted parts, small surface area stainless steel sampling chamber for fast response time. Enclosure Aluminum or optional 316 Stainless Steel, Glass lens, IP66 & IP68 FM/CSA Explosion Proof Certified Class I, Div I, Groups B, C And D Class II, III, Div 1, Groups E, F And G ATEX Explosion Proof Certified ATEX 2 GD, Exd I & IIC; IECEx, Exd I & IIC Dimensions SS enclosure- L: 8.7" (221mm) W: 5.8" (147mm) H: 4.8" (122mm) Weight Total: 8.4 Lbs (3.8 Kg) Pressure: 5000 PSIA (345 Bar) Flow Control Orifice can be placed at Inlet(default) or Outlet; Built in serviceable/cleanable 100 micron Filter
Miscellaneous Features	Through the glass user interface buttons, allow operation while enclosure is closed NIST traceable calibrations Units of measure: °C & °F dewpoint, ppmV, ppmW, µB H_2O vapor pressure, grams of H_2O / m^3 and Lbs H_2O /10^6 standard cubic feet in Natural Gas Virtual Analyzer PC software for training and evaluation, allows the user to experience the exact interface on their own PC with voice explanations

Appendix A ExMa Installation Drawing



These drawings and any specifications and concepts contained are the property of Phymetrix Inc., are issued in strict confidence and shall not be used as the basis for the manufacture or sale of apparatus or services, or reproduced or copied or transmitted in any form or by any means without written permission.



Appendix B ExMa Electrical Connections

Appendix B ExMa Electrical Connections

Appendix B ExMa Electrical Connections

Appendix C Notes on ExMa use in low power applications e.g. solar power

For all power consumption calculations it is assumed that the ExMa will be powered by 12VDC, unless otherwise noted.
Power connections:
+12VDC to J2 pin 12
RETURN (Gnd) (-) to J2 pin 11

Analyzer Power Consumption
The ExMa (with the display backlight OFF) will draw about 13 mA from 12VDC power.
The display backlight will draw an additional 2.5 mA at 100% and proportionally lower on the other settings, which can be user selected. The backlight can be turned OFF, but each time the user presses a button on the screen the backlight will turn on to a low setting (~ 0.5 mA) for a few seconds.

Analog Output Power Consumption
The Analog output will use 4 to 20 mA depending on the measurement. It is also possible to order the ExMa with voltage output 1-5V, which will further reduce current consumption by avoiding the 4-20 mA.

Relay Power Consumption
It is better not to have Alarm Relays for solar Powered Application, but if they are needed, in order to conserve current there is a pulse width modulator for the Alarm Relay drive. The Relays will each draw about 37 mA at 100% PWM, and proportionally less e.g. at 55% about 21 mA. The Relay PWM percentage can be user selected. (go to MENU-4)
Be sure to configure the relay polarities in such a way that power consumption is minimized. For example if only one Relay will be used then configure the other to a very high dewpoint and select the polarity such that the relay is not energized. For the Relay that is used select the polarity such that current draw is minimized, but also consider that having the Relay energized while conditions are “GOOD” provides a fail safe operation in that if the analyzer looses power the relay will signal an alarm condition.

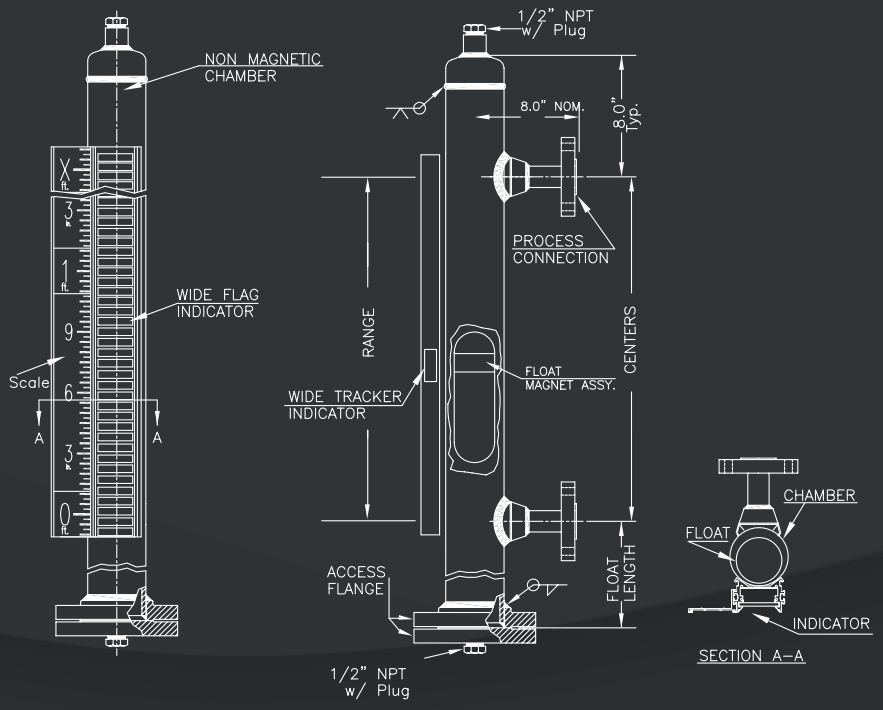
MAG-GAGE®
THE SUPERIOR MAGNETIC LEVEL GAUGE

- Patented Wide-Flag®
  Solid Design Magnet
  -350° / 1100° F rating
- Standard 2 to 4 week delivery
  Expedited delivery available
- Constructed to meet ANSI/ASME
  codes B31.1/B31.3 Min. Sch 40
- No Pressurized Floats
- All Welds are GTAW/TIG
  No MIG or T-Drilling
- Replaces Sightglasses

ISO 9001 Certified 1410004



PROCESS LEVEL TECHNOLOGY, LTD.

The Process Level Technology Mag-Gage® is a proven method to measure liquid levels. The Mag-Gage® is one of the safest and most economical ways to measure and control your level requirements. It can be installed on almost any shape, size or type of vessel in the industry. In applications of extreme pressure, temperature, vibration and highly corrosive or hazardous material the Mag-Gage® will perform where others fail.

Principles of Operation

The Chamber is constructed of non-magnetic materials, and process connections to mate with those of the tank, vessel or other equipment where the level is to be measured.

The Float is engineered and located inside the Chamber. It is sized and weighed to the specific gravity of the process fluid to be measured. The float contains a 360° Magnetic Assembly which generates a strong uniform magnetic circuit. The magnetic Flux Lines generated by the float interlocks with the indicator. The hermetically sealed Indicator, the Wide Flag® or Wide Tracker® Style, contains its own magnetic assemblies which interlock with the float through the Chamber, providing a strong and reliable design. As the Float moves with the changes in the liquid level, the magnetic attraction between the Indicator and Float will ensure that the Indicator will track the position of the float exactly and the liquid level is measured precisely.

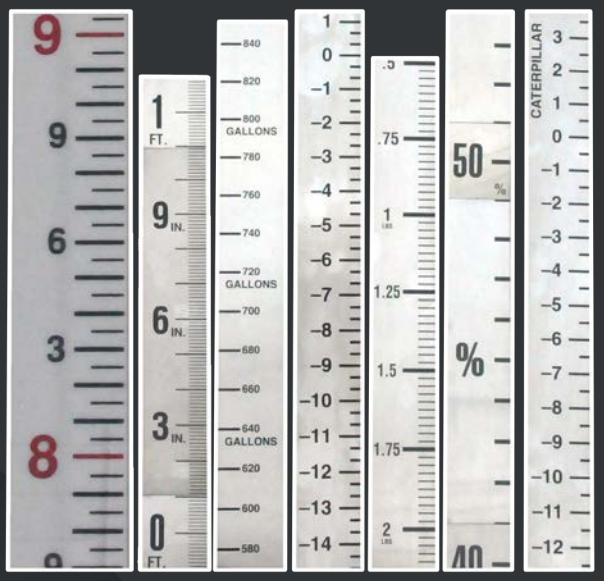
INDICATORS

Wide Tracker®

Wide Flag® (Patented)

Wide Tracker®

- Extra Large Rectangular Indicator
- 1.40" Wide X 1.5 Long
- Bright Yellow (other colors available)
- Dual Magnetic Coupling



Wide Flag®

- Easy to read 1.40" Wide-Flag (Visible from 200+ ft.)
- Patented solid one piece ceramic magnetic flag
- 180 degree rotation
- Temperatures from -350°F to 1100°F
- High contrast Yellow (liquid) and Black (vapor)
- Other color combinations available

Available Enclosures:
Anodized Aluminum or 316 Stainless Steel

Scales

- Scale can be customized to any increments (ft./in., gallons, percent, metric, etc.)
- All scales are photo etched into Stainless Steel - No rusting, fading or stickers falling off
- Large, easy to read markings that allow measurement to be taken from a safe distance

Scales Available In:

- Feet/Inch Standard
- Metric
- % Scale
- 10ths Scale
- Wide Acrylic Scale
- Gallon Scale
- +/- Scale
- Inch only Scale

A SUPERIOR MAGNETIC CIRCUIT

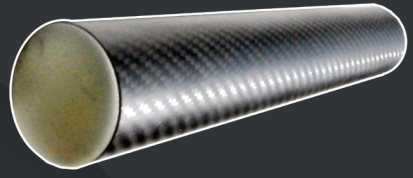
When designing the magnetic circuit between the float and indicator there are many considerations other than just how strong the magnets are in the float. The Mag-Gage® level gages have undergone extensive testing to produce a rigid and high performance design. With a unique construction the indication performs under the most demanding conditions such as high/low temperatures, vibrations, even schedule 160 chambers. Our patented solid magnet Wide Flag® design not only provides highly visible indication but provides a powerful connection with the float. The reliability and repeatability of the Mag-Gage® float and indicator combination is unmatched.

CPVC Float

Kynar Float

Titanium High Pressure Float

High Pressure Interface Float with Field Adjustable Weight



Coated Float for Corrosive Process

- All floats are engineered to the specific operating conditions of each application.
- Shell is constructed of stainless steel, titanium, hasteloy, monel, CPVC, PVDF (Kynar), or any other non-magnetic material.
- Magnetic circuit is made of a series of Alnico magnets to provide a light yet effective connection.
- We can handle the highest pressures in the industry with no oversized, pressurized or vented floats. Pressurized floats can be a safety concern and can leak over time.
- PLT uses solid engineering to conquer the demands of high pressures and low gravities.

Standard Stainless Steel Float

The Carbon Fiber Float® (Patented)

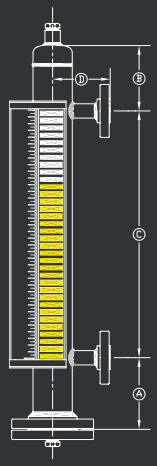
MAG-GAGE® LIQUID LEVEL ORDERING GUIDE

Standard Specifications

- Non-Magnetic Chamber material
- All Flanges, Fittings and Pipe meet ASME/ANSI Standards
- Fabricated/Welded to B31.1/B31.3 code

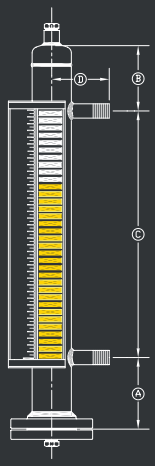
Scale

- Feet and Inches, ¼" divisions
- Photo etched and backfilled on stainless steel
- Metric, Percentage, or Volumetric available
- Optional 3½" Acrylic scales



Float Chamber

- 2" to 3" pipe W/RF Flanges - Sch 40
- ½" FNPT vent and drain connections
- All flanges and fittings rated for process conditions
- Connections: ½" through 8" plus
- Pressure ratings vacuum to 5000 PSIG
- Temperature Rating: -350°F to +1100°F
- Specific gravity range: 0.28 and up
- Lengths from 4.0" to 50 feet



Indicator

- Bright colored
- Can be seen from 200 ft. or more
- 1.4" wide
- Hermetically Sealed

MAG-TRANS® PREMIER LEVEL TRANSMITTER

The Mag-Trans® 2523 Series Level Transmitter is the next generation in Magnetostrictive Level Sensing Technology. It contains a dual compartment enclosure attached to the piezomagnetic wave guide sensor. The output is reliable, repeatable, fast and accurate.

- Standardized Dual Compartment
- Stainless Steel Enclosure Option
- Two Wire: Loop Powered
  - 10-30 Vdc (24 Vdc Nominal)
- Graphic Display:
  - Inch-Metric-Percent
  - Scroll-Tile
- HART – Protocol
- PACTware
- Local Programming
- Repeatable
- Reliable
- Variable Range
- Process Temperatures: -50°F to +800°F
- Class 1, DIV 1, GRP B, C, D

Specifications

Accuracy	+/- 0.015
Repeatability	.001% Full Span
Linearity	.020% Full Span
Refresh Rate	25x per second
Damping	1.0-25.0 Seconds
Electrical Classfication	Class 1, Div 1, Grp B, C, D

Input	10-30 Vdc (24 Vdc Nominal)
Output	4-20mA, HART

Section 2.1.0. - Description

2.1.1. INTRODUCTION

Process Level Technology, Ltd magnetic level gages (**MAG-GAGE®**) are an indirect reading liquid level indicator. The magnetic level gage series utilize non-magnetic 2.00-inch, schedule 40 chambers (standard) manufactured to length specifications with process connections that match those of the vessel or tank. For some high pressure, low gravity applications, a 3.00-inch schedule 40 chamber is available. The process connections may be:

1. Side mounted, threaded, flanged or socket welded
2. Top and bottom flanged mounted
3. Tank top mounted
4. Combination

A variety of mounting styles is available to suit any vessel or piping requirements. Refer to the drawing depicting magnetic level gage mounting configurations.

2.1.2. COMPONENTS

The gage chamber contains a magnetic float and is completely isolated from the indicator housing attached to the outside of the gage chamber. External indicators consist of a single yellow or continuous flag/flipper models. The magnetic float maintains a magnetic bond with the external level indicator. As the level of the process medium fluctuates within the tank and gage chamber, the float reacts accordingly with the indicator recording the level of the fluid within the chamber.

2.1.3. CHAMBER MATERIAL

Gages are manufactured to meet exact specifications of the process media such as operating pressure, temperature, specific gravity, etc. Standard chamber materials are 316/304 stainless steel however any non-magnetic material may be used. Other chamber materials that are available include CPVC, Kynar, Hastelloy, Alloy 20, Zirconium, Monel, Etc.

Section 2.1.0. – Description

2.1.4. INTERNAL FLOAT

A magnetized float is contained inside the float chamber and is designed to the requirements of the process conditions. For this reason floats are not interchangeable unless the process conditions and gage chambers are identical. The float moves freely inside the chamber reacting to fluctuating level changes within the adjoining vessel.

2.1.5. FLOAT SUBMERGENCE

Under normal operating conditions, the float should be submerged about 80% or more in the process fluid. It is important to note, however, that the position of the float in the media will vary with different process conditions. Float magnets are located in the upper portion of the float.

2.1.6. GAGE RATINGS

Magnetic level gages can be designed for operating conditions from full vacuum service up to 5000 PSIG, 1100 degrees F, and a minimum gravities of 0.20. All magnetic gages with alloy chambers will have full ANSI ratings based on flange classifications. Gages with CPVC, Kynar (PVDF) or Fiberglass shields will have 150 PSIG ratings only.

2.1.7. HYDROSTATIC TESTING

Gage chambers are hydrostatically tested to 150% of indicated gage rating without floats installed. Floats are tested individually. Gages can be field hydrostatically tested after installation at the operator's discretion. ***CAUTION: Do not conduct hydrostatic testing of the magnetic gage chamber attached to a process vessel with the float installed. If a gage is field tested with the float installed, the float may crush and chamber may become damaged. This procedure will void the warranty.***

Section 2.2.0. - Level Indication

2.2.1. INTRODUCTION

There are two types of external level indication options offered by Process Level Technology, Ltd. for magnetic level gages. The single indicator (ST)/(SST) is recommended for stagnant storage level applications with little or no level fluctuations. The wide flag indicator (WF)(SWF) is recommended for turbulent or high vibration level conditions.

2.2.2. SINGLE TRACKER INDICATION (ST or SST)

The single follower assembly used for indicating level consists of a rectangular yellow magnetic follower sealed in a channel with a 316 stainless steel calibration scale marked in feet and inches, total inches or in centimeters. The indicator is mounted parallel and immediately adjacent to the gage chamber to allow maximum magnetic coupling between the float and the follower within the indicator channel. The indicator is sealed to prevent dirt and moisture accumulation. A red bumper is positioned at the bottom of the channel to cushion the impact of the follower against the cover. Although the yellow follower provides maximum visibility even at nighttime, retrofit kits for illuminating gages are available.

2.2.3. SINGLE TRACKER INDICATION - REFERENCE GUIDE

A black reference guide in the center of the yellow follower allows the operator to match the graduated scale with the level of the process fluid. A nameplate at the lower end of the scale provides zero level indication. If the yellow follower is decoupled from the internal float's magnetic field, the follower will descend below the zero point on the scale. Thus, when the vessel is empty, the level gage will read zero and the yellow follower will remain visible. To prevent the float from losing magnetic coupling with the follower, a spring is mounted inside the top and bottom of the gage chamber. This cushion the impact of the float against the chamber ends when the vessel is completely full or empty. The float and the follower are magnetically coupled when the follower remains visible. If the magnetic coupling is lost between the float and follower, use a hand magnet to attract the follower until it is contained within the float's magnetic field. Refer to the Troubleshooting portion of the manual, Section, 2.7.2.

Section 2.2.0. - Level Indication (cont.)

2.2.4. WIDE FLAG/FLIPPER INDICTION (WF),(SWF)

Process Level Technology offers a continuous Wide Flag or Flipper style indicator as an option to the Single Yellow Follower indicator. Flag indications are industrial grade level indicators which consist of a series of ceramic flags, black on one side, yellow on the other. As the magnetic float reacts to level fluctuations, each flag or flipper will rotate 180 degrees to reveal the opposite color.
Process Level Technology, Ltd. a flipper is housed in a rugged sealed housing with a recessed glass window and rotates on a ceramic and stainless steel surface. This eliminates the flippers from sticking or hanging up. The unique design prevents all flippers from rotating in excess of 180 degrees and each flag is magnetically locked to the next. Wide Flag indicators are recommended where surging or turbulent level conditions exist. Each flag indicator is 1.40 inches wide and is more visible than the standard single indicator. These are available with or without scales up to 20 ft.

2.2.5. WIDE FLAG/FLIPPER INDICATION - REFERENCE GUIDE

Yellow represents liquid column, **Black** represents vapor space.

2.2.6. WIDE FLAG/FLIPPER INDICATION - RETROFIT

When flipper style indicators are purchased with a Process Level Technology, Ltd. magnetic level gage, no installation is necessary. If the indicator is removed or a retrofit kit is purchased for a gage already in service, however, the following steps should be noted:

1. The mounting clamps connecting the flipper assembly to the gage chamber are adjustable to most manufacturers' standard, (i.e. 1.50 inch to 2.50-inch pipe). If the gage is in service and there is liquid in the tank, only the flippers adjacent to the float will rotate to yellow when the indicator assembly is clamped on.
2. Run a magnet along the window of the indicator from zero to where yellow is showing as noted, or
3. Drain the gage to zero on the indicator, and then fill again. As the float rises, the level indicator will react accordingly and will be reset properly.

Section 2.3.0. - Installation

2.3.1. INSPECTION

All magnetic level indicators are securely packed in crates to provide maximum protection of the equipment during shipment. It is important to unpack and inspect each gage upon receipt to insure the indicator and chamber were not damaged in shipment. If you should find damaged parts, contact Process Level Technology, Ltd. immediately. All Process Level Technology, Ltd. magnetic gages are fully insured against damage or loss unless specified by the customer otherwise. Claims must be filed within 15 days from the date of receipt of shipment.

2.3.2. CHAMBER ORIENTATION

The **magnetic float is packaged separately for shipment**; the Float is strapped externally to the outside of chamber which should be removed before installation. The float chamber should always be leveled vertically. If it is not leveled correctly, the float may be magnetically uncoupled from the level indicator during operations.

2.3.3. CONNECTION VALVES

Valves should be installed between the process vessel and level gage to allow for isolation, draining, and cleaning purposes. (See section 2.6.2. on Maintenance for more details on cleaning and maintenance procedures). Standard block valves can be ordered with the gage or separately from Process Level Technology. Ball check valves are not necessary for magnetic level gages. If certain valve specifications are required, please advise Process Level Technology, Ltd. accordingly.

2.3.4. FLOAT ORIENTATION

The internal magnetic float has a preferred orientation vertically which is inscribed at the top of the float. Install the float properly by taking note of the correct orientation through the chamber flange connection. If the float is installed into the chamber inverted, it will not couple with the external indicator correctly, resulting in improper level indication. Floats that are installed in gages with inverted chamber construction will contain a loop at the top of the float for installation and removal purposes. **Internal floats should be installed after any hydrostatic field tests of the chamber and connecting vessel are complete.**

Section 2.3.0. - Installation (cont.)

2.3.5. CHAMBER GASKETS

Standard magnetic level gages are supplied with 0.125-inch composition gaskets. If this type of gasket is not compatible with the process media, appropriate gaskets should be used in replacement of those shipped with the gage.

2.3.6. FLANGES AND CONNECTIONS

Process connections and vent/drain flanges are designed to meet each customer's specifications. All flange boltholes straddle the centerline unless otherwise specified. Both male and female threaded connections and socket weld connections are available. ***DO NOT WELD ON MAG-GAGE OR ON THE VESSEL WITH INDICATOR AND FLOAT INSTALLED, THIS WILL DESTROY THE MAGETIC CIRCUIT.***

2.3.7. INTERFACE APPLICATIONS

Magnetic level gages can be used to identify fluid interfaces only if the proper specific gravities have been identified at the maximum operating conditions. The float can designed to float in one media while sinking in the other. Immiscible oil over water levels is an example. Care should exercised, however, when using magnetic level gages in interface applications because *rag layers* may exist which are difficult to identify.

Do not install a gage with two floats and two single indicators on one chamber for an interface**.** In this case the two floats may *collide* causing incorrect readings. Chambers can be manufactured with multiple connections for maximum process influx. The proper method is to install one gage per process phase, not a combination.

Section 2.4.0. - Operation

2.4.1. INTRODUCTION

It is important that all instructions pertaining to entering magnetic level gages into service be read thoroughly first before commencing with service operations. Failure to do so may void the warranty by subjecting the gage to a potential safety hazard.

2.4.2. PROCEDURES

1. Check that the operating conditions, (temperature, pressure and specific gravity) are within that maximum rating of the gage. Each gage has a permanent nameplate indicating process specifications, serial number, tag number, etc. It is critically important to check that the specific gravity of the process media is specified at the maximum operating conditions.

2. The gage chamber should be leveled vertically, empty, blocked in and isolated. Check to see that all drain and vent plugs are in place. Close all vent and drain valves if plugs are not used.

3. For *standard* gages, install the float by removing the bottom drain flange located at the base of the gage. The float is marked TOP to insure proper orientation. A spring is attached to the inside of the drain flange to cushion the float when the vessel is empty. Reinstall the bottom drain blind flange with a new flange gasket after the float is in place.

4. For *inverted* gages, remove the top vent blind flange from the gage chamber. Install the float by inserting a string through the float loop and lower the float into position slowly. Remove the string from the float and chamber after the float is resting on the bottom of the gage. An auxiliary magnet may be required to recouple the indicator, (either single follower or flipper indicator), to the internal float.

5. Reinstall the blind flange with a new gasket. The gage chamber should be isolated with no opening to atmosphere. Check to see that all drain and vent plugs are securely in place and that any vent and drain connections are closed.

Section 2.4.0. - Operation

2.4.2. PROCEDURES (cont.)

6. When the gage is mounted and ready for placement into service, PARTIALLY OPEN THE **TOP** PROCESS CONNECTION VALVE FIRST and very **slowly** to allow initial pressure and temperature equalization between the vessel and the level gage. This allows the process conditions of the vessel to equalize with the gage slowly and reach operating conditions at a slow, even, and reasonable rate.

7. **CAUTION.** DO NOT OPEN THE **BOTTOM** PROCESS CONNECTION VALVE FIRST. IF THE BOTTOM VALVE IS OPENED FIRST WITH THE TOP VALVE CLOSED AND THE VESSEL IS UNDER PRESSURE, THE INTERNAL FLOAT WILL RISE INSTANTLY AND LODGE ITSELF INTO THE TOP OF THE CHAMBER CAUSING SEVERE DAMAGE TO THE FLOAT AND CHAMBER.

8. After the float chamber has reached process conditions, continue to open the **TOP** process connection valve slowly, allowing any liquid or condensate to enter the gage slowly. This procedure is critically important for high pressure and temperature applications. The float and indicator may react or rise to condensate accumulation migrating through the top valve with the bottom valve closed.

9. When the gage chamber has attained normal operating conditions, open the **BOTTOM** process valve connection slowly. This will allow proper fluid entry into the gage chamber under normal operating conditions. The level indicator should rise vertically, thus rendering a fluid level. Flag or flipper indication will result in black to yellow rotation of the flippers as the fluid rises. At this point, installation should be complete. Allow at least 30 minutes for both top and bottom valve procedures.

10. Please note, under elevated operating conditions, the indicator may record a significant level from condensate influx through the top valve *before* the bottom valve is opened. If this is the condition, it is possible the indicator (and float) may readjust and fall slightly from the effects of final process equalization after the bottom valve is completely opened.

11. Extended Storage: All MAG-GAGE® magnetic level gages and gage accessories not put in service shall be stored inside in the original creates

Section 2.5.0. - Removal from Service

2.5.1. INTRODUCTION

To remove the gage from service, the next steps should be followed to prevent danger to personnel and damage to the gage when the vessel is pressurized.

2.5.2. PROCEDURES

1. Close the bottom process connection valve first to prevent further process influx to the gage.

2. Completely close the top process connection valve to isolate the gage from the process conditions.

3. Attach proper vapor collection equipment to the gage vent connection if required.

4. Open the vent valve slowly to relieve gage pressure and allow ambient air influx.

5. Attach the proper liquid collection equipment to the drain connection is required.

6. Open the drain valve slowly to remove remaining gage liquid.

7. **CAUTION**: Never use the vent or drain on a gage as a pressure relief mechanism for the process system. Doing so may permanently damage parts of the gage as well as inducing a safety hazard.

Section 2.6.0. - Maintenance

2.6.1. INTRODUCTION

Process Level Technology, Ltd. magnetic level gages contain a standard 0.50 inch vent and drain plug in the top and bottom of the gage chamber to allow cleaning and removal of the process fluid if required. Socket weld vent and drain valve connections are available. Some gages are connected to a solvent or steam line that allows **empty gages without floats** to be decontaminated or *blown down* periodically without removing the gage from the vessel location. Process Level Technology, Ltd. magnetic gages should be maintained and inspected on at least an annual basis, or more frequently depending on the process system.

2.6.2. PROCEDURES

1. Block in the gage chamber with the process connection valves or wait until the vessel is empty and out of service.

2. Close the bottom valve first and the top valve second.

3. Open the vent valve slowly or remove vent plug carefully to depressurize the gage especially if the gage has been under pressure.

4. Open the drain valve slowly or remove the drain plug carefully to allow any remaining fluid to drain from the chamber.

5. When all of the gage fluid has been drained, carefully remove the drain flange and float from the gage chamber. Be sure to examine the float for excessive wear and clean as required.

6. Clean the inside wall of the chamber with a "bottle brush" or similar scrubbing tool. Some processes may dictate the use of a suitable solvent for cleaning.

7. After cleaning of the chamber, replace the float and drain flange. A new flange gasket should be installed. Use gaskets compatible with the process media if replaced.

Section 2.6.0. - Maintenance

2.6.2. PROCEDURES (cont.)

8. Check the stainless steel pipe clamps to insure they are tight and adjust the scale channel. Correctly match the zero point to process connection elevations.

9. If necessary, use a permanent magnet to attract the yellow indicator until it is coupled to the float inside the chamber.

Section 2.7.0. - Troubleshooting

2.7.1. INTRODUCTION

Process Level Technology, Ltd. magnetic level gages are simple to install and operate. The following troubleshooting tips may be of assistance during installation and startup. Complete reading of this is required.

2.7.2. FLOAT & INDICATOR DETACHMENT

1. If detachment is a frequent problem, it could be caused by several factors, most of them resulting from improper installation of the gage, particularly the float.

2. Check to ensure that the scale and channel assembly is fastened tight against the gage chamber so that magnetic coupling is maintained from top to bottom of the indicator.

3. Check to ensure the internal magnetic float within the chamber is right side up. If the float was installed inverted, the single yellow indicator will magnetically couple, but the actual process level will be higher that what the indicator records. All floats are clearly marked TOP. Floats designed for *inverted* gages will have a loop welded at the top of the float for installation and removal purposes.

4. If the float springs mounted in the top and bottom of the gage chamber have been removed, the float could rise past the top of the indicator and lose magnetic coupling with the indicator.

5. If the process connection dimension has been miscalculated and the gage length is too long, do not attempt installation because it will warp the chamber. A warped chamber will prohibit the float to move freely. This can cause float and indicator detachment.

2.7.3. DIFFERENTIAL LEVEL

This can occur during startup and is easily corrected. Under normal operating conditions, most floats are about 80% submerged in the process media. It is important to note that the position of the float in the fluid will vary with different process conditions. To attain a true level elevation, adjust the scale vertically to get an exact reading.

Section 2.7.0. - Troubleshooting (cont.)

2.7.4. DEFECTIVE INDICATOR

If the glass indicator cover is cracked or broken, a replacement cover can be shipped within 24 hours after receipt of order. One advantage of the magnetic level gage is the indicator assembly can be serviced without removing the gage chamber from service. To replace the indicator cover, remove the four screws from cover plate at the top and bottom of the indicator channel. There are two red gaskets beneath each cover that require removal. Remove the two red seal strips and slide the glass plate cover out of the channel. Clean any debris or fragments. Replace the glass cover with the new glass plate by sliding into the channel again. Replace each red side and top gaskets with the top and bottom covers. If the gage is inexcess of 6 feet in length, it may be easier to remove the indicator from the channel.

2.7.5. SWITCH MALFUNCTIONING

All level switches may be wired to trip on rising or falling level. After the switch is connected to the desired alarm function, it is necessary to set the switch. This is accomplished by passing the float either manually or by filling the gage chamber until it passes the highest switch. This will trip the switch to the desired setting so it will alarm properly with rising or falling level.

Section 2.8.0. - Parts List

2.8.1. INTRODUCTION

When ordering spare parts for the MAG-GAGE® series magnetic level gage, the following information will be required.

1. Serial number of the gage or accessory item.
2. Description of parts to be ordered.
3. Model number of the parts to be ordered, if known.
4. Original purchase order, if known.

9

2.8.2. CHAMBER

1. Vent plug.
2. Float chamber
3. Chamber blind flange, spring, and gasket.
4. Drain plug.
5. Internal magnetic float.

2.8.3. INDICATOR & SCALE ASSEMBLY

1. Channel assembly
2. Anodized Alum. Indicator track with single tracker follower or wide flag indication
3. Stainless Steel Indicator track with single tracker follower or wide flag indication
4. Top and bottom seals
5. Calibration scale (total inches, feet & inches, centimeters)
6. Chamber clamps
7. Identification Tag.

Section 2.9.0. - Warranty

2.9.1. INTRODUCTION

All Process Level Technology, Ltd. products are warranted against defects in material and workmanship for one year (365 days) from the date of shipment. Process Level Technology, Ltd. will repair or replace those products that fail to perform as specified with the following exceptions. This warranty does not apply to glass breakage or any other liability other than materials and workmanship.

2.9.2. CONDITIONS

1. Products repaired or modified by persons that are unauthorized by Process Level Technology, Ltd

2. Products subject to misuse, negligence or accidents

3. Products that are connected installed or otherwise used in such a way not in accordance with the manufacturer's instructions.

2.9.3. PROVISIONS

This warranty is in lieu of any other warranty expressed or implied by any party other than Process Level Technology, Ltd. Repairs and/or replacements shall be at the sole discretion of Process Level Technology, Ltd. based on the terms and conditions.

Section 2.10.0. - Terms and Condition of Sale

2.10.1. INTRODUCTION

All orders should be entered to the following address:

Process Level Technology, Ltd.
888 Clear Creek Ave.
League City, Texas 77573
PH# (281) 332-MAG1(6241), Fax# (281) 332-0232

2.10.2. TERMS

The payment terms are **Net 30 days** to approved customers. Sales representatives may assume collection responsibility for new accounts at their discretion. Late charges will be added at the rate of 1.50% per month.

2.10.3. SHIPMENT

All shipments will be **F.O.B. factory location, Houston, Texas**, via motorfreight insured. Freight charges are normally prepaid and added to invoice unless specified otherwise.

2.10.4. RESTOCKING

Every magnetic level gage is designed and manufactured to exact customer specifications. As a result, there will be **no restocking option** after shipment is made.

2.10.5. CANCELLATION

Cancellation charges after order placement will be at the discretion of Process Level Technology, Ltd. and dependent upon production phase of the product.

Section 3.1.0. - Non Bleed, Block & Bleed Switches (MGS-100)

3.1.1. INTRODUCTION

MGS-100 pneumatic switches are designed for use on magnetic MAG-GAGE® series gages only. The MGS-100 is a non-bleed, block and bleed pneumatic switch operates when the magnetic field of a Process Level Technology, Ltd. magnetic float passes by it, either on a rising or falling level condition. Since there is no physical interaction or connection between the switch and float, it is very important that all installation instructions be followed properly for the switch to function reliably. Please read all installation and operation instructions before beginning installation.

3.1.2. OPERATING SPECIFICATIONS

Medium:	Filtered Air or Gas
Supply Pressure:	VAC to 200 PSIG
Max. Temp:	200 degrees F (93C)
Air Flow:	29 SCFM @ 100 PSIG
Air Consumption:	Zero SCFM

3.1.3. INSTALLATION

1. Loosen the included hose clamps completely and install them so they surround the gage chamber. Reattach the clamp to itself, make 2 or 3 turns of the clamp's screw but do not reattach completely.

2. Insert the top "L" shaped bracket under the top hose clamp and tighten the clamp to the gage chamber. The top bracket is the bracket above the front label if the writing is right side up. Before tightening, you may adjust the height at which you would like the alarm to trigger. The trigger point is at the midpoint of the enclosure.

3. Since the switch should be securely fastened to the gage chamber by the top clamp, slide the bottom hose clamp over the bottom bracket and tighten the clamp to the gage chamber.

Section 3.1.0. - Non Bleed, Block & Bleed Switches MGS-100

3.1.4. INSTALLATION - (cont.)

4. The alarm switch should be mounted so that it is level with the ground. If it is not level, loosen the hose clamps, adjust the switch's alignment, and when the switch is level, retighten the hose clamps. Improper alignment may cause the switch to malfunction.

5. The switch must also be flush and tighten against the chamber. Failure to do this results in vibration and rattling of the switch, which may in extreme circumstances cause the switch to fail.

6. No material should be present between the switch housing and the gage chamber. Any material present can interfere with the magnetic field of the internal float and prevent proper activation of the switch.

3.1.6. OPERATION & MAINTENANCE

1. The pneumatic supply line must be connected to the connection labeled 1 OR 2 The output to the alarm or other signaling device must be connected to the connection labeled **PORT 3**.
2. **PORT 1** is the supply port that will activate the output when the float passes above the switch. Port 2 is the vent It is to be used as a *HIGH LEVEL* indicator.
3. **PORT 2** activates the output when the float passes below the switch. Port 1 is the vent IT is to be used as a *LOW LEVEL* indicator.
4. All input and output connections are 1/4-inch NPT connections.
5. The muffler must remain uncovered and clean for proper non-bleeding functioning of the switch. If covered, the interior of the switch may pressurize and explode.
6. Pneumatic connections must provide air or gas that is free of particulate matter or debris. Dirty supply gas may cause the valve inside to clog and lead the switch to failure.
7. When the switch is first installed, **it is necessary to set the switch for normal operation**. This is accomplished by passing the float pass the switch, the chamber can be filled with liquid so the float will pass the highest switch and then drained, or by manually sliding the switch pass the float in both directions. If the switch is being positioned above the float, the float must pass in the down direction before installation and conversely if the switch is positioned below the float.

Section 3.2.0. - Pneumatic Level Controller (LCP)

3.2.1. INTRODUCTION

The LCP Pneumatic Level Switch Controller provides supply and vent air control for two pneumatic switches used in a high and low point level application. The LCP is designed to be used with pneumatic switches on magnetic MAG-GAGE® series gages only.

3.2.2. OPERATION

1. As the float rises past the high pneumatic switch level, it will supply air to the port P4 of the controller.

2. When port P4 has air supplied to it there will be a pneumatic signal out of port 2 of the controller. The pneumatic signal will continue until the float passes the low pneumatic switch.

3. The low switch will supply a signal to port P2 on the controller therefore shutting the pneumatic signal off. The output signal will stay off until the float rises past the high pneumatic switch.

4. The cycle will then repeat.

5. To reverse the output on the controller, connect the high pneumatic switch to port P2, and the low pneumatic switch to P4 on the controller.

Section 4.1.0. – Electric Level Switches (MGS-200EX/MGS-200EX2)

4.1.1 INTRODUCTION

The MGS-200EX and MGS-200EX2 are hermetically sealed bistable-latching switches designed for magnetic MAG-GAGE® series gages only. The MGS-200EX has single pole double throw contacts (SPDT) and the MGS-200EX2 has double pole, double throw contacts (DPDT). The switch will change state when the float passes by it in a rising or falling level condition. The switch remains in a latched position until the float passes the switch in the opposite direction. The MGS-200EX and MGS-200EX2 does not require any routine maintenance

4.1.2 SPECIFICATIONS

Maximum switching voltage:	150 VDC/VAC
Maximum switching current amps:	1.0 amps (VDC/VAC)
Maximum switching wattage:	25 watts (VDC/VAC)
Minimum breakdown volts:	250 VDC
Maximum Temperature (standard):	350 degrees F
Maximum Temperature (HT option):	800 degrees F
Ambient Temperature Range	-25C to +85C
Dead Band:	0.35 inch
Electrical Area Classification:	Class I Div I Grp. B,C,D

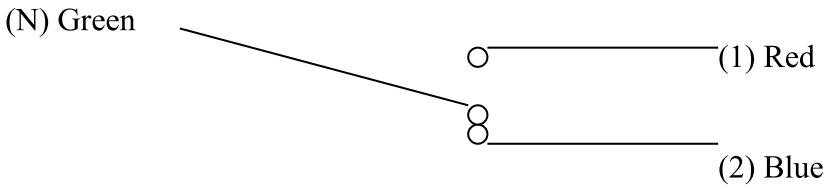
4.1.3 MOUNTING

The MGS-200EX/EX2 is mounted to the MAG-GAGE® chamber with all 316 Stainless Steel worm gear pipe clamps. Rod mounted switch assemblies are available as a factory installed option. Switch points can be changed at any time by loosening the clamps and sliding the switch vertically to the desired set point.

4.1.4 OPERATION

When the switch is first installed, it is necessary to set the switch for normal operation. This is accomplished by passing the float pass the switch, the chamber can be filled with liquid so the float will pass the highest switch and then drained, or by manually sliding the switch pass the float in both directions. If the switch is being positioned above the float, the float must pass in the down direction before installation and conversely if the switch is positioned below the float.

Section 4.3.0. – Electric Level Switches (MGS-200EX/MGS-200EX2)



Caution: If there is a need to take the switch out of service or disconnect it for any reason, then make the sure the circuit is de-energized.
Note: Keep cover tightly closed when in operation. To prevent ignition of GRP. B atmospheres a approved sealing fitting must be installed

4.1.5 ELECTRICAL WIRING – RISING LEVEL

N/O	Red	Terminal 1	Closes on rising level.
C	Green	Terminal N	
N/C	Blue	Terminal 2	Opens on rising level.

4.1.6 ELECTRICAL WIRING – FALLING LEVEL

N/C	Red	Terminal 1	Opens on falling level.
C	Green	Terminal N	
N/O	Blue	Terminal 2	Closes on falling level.

Section 4.2.0. – Electric Level Switches (MGS-500EX/MGS-500EX2)

4.2.1 INTRODUCTION

The MGS-500EX and MGS-500EX2 are hermetically sealed bistable-latching switches designed for magnetic MAG-GAGE® series gages only. The MGS-500EX has single pole double throw contacts (SPDT) and the MGS-500EX2 has double pole, double throw contacts (DPDT). The switch will change state when the float passes by it in a rising or falling level condition. The switch remains in a latched position until the float passes the switch in the opposite direction.
The MGS-500EX and MGS-500EX2 does not require any routine maintenance

4.2.2 SPECIFICATIONS

Maximum switching voltage:	300 VDC/VAC
Maximum switching current amps:	3.0 amps (VDC/VAC)
Maximum switching wattage:	100 watts (VDC/VAC)
Minimum breakdown volts:	1000 VDC
Maximum Temperature (standard):	350 degrees F
Maximum Temperature (HT option):	650 degrees F
Ambient Temperature Range	-25C to +85C
Dead Band:	0.35 inch
Electrical Area Classification:	Class I Div I Grp. B,C,D

4.2.3 MOUNTING

The MGS-500EX/EX2 is mounted to the MAG-GAGE® chamber with all 316 Stainless Steel worm gear pipe clamps. Rod mounted switch assemblies are available as a factory installed option. Switch points can be changed at any time by loosening the clamps and sliding the switch vertically to the desired set point.

4.2.4 OPERATION

When the switch is first installed, it is necessary to set the switch for normal operation. This is accomplished by passing the float pass the switch, the chamber can be filled with liquid so the float will pass the highest switch and then drained, or by manually sliding the switch pass the float in both directions. If the switch is being positioned above the float, the float must pass in the down direction before installation and conversely if the switch is positioned below the float.

Section 4.3.0. – Electric Level Switches (MGS-700EX(/2),MGS-900EX2(/2))

4.3.1 INTRODUCTION

The MGS-700/900EX and MGS-700/900EX2 are bistable-latching switches designed for Process Level Technology, Ltd. MAG-GAGE® series gages only. The MGS-700/900EX has single pole double throw contacts (SPDT) and the MGS-700/900EX2 has double pole, double throw contacts (DPDT). The switch will change state when the float passes by it in a rising or falling level condition. The switch remains in a latched position until the float passes the switch in the opposite direction.

4.3.2 SPECIFICATIONS

	MGS-700EX(/2)	MGS-900EX(/2)
Maximum switching voltage:	250 VAC	250 VAC
Maximum switching current amps:	10.0 amps VAC	15.0amps VAC
Maximum switching wattage:	2500 watts VAC	3250 watts VAC
Maximum Temperature (standard):	350 degrees F	350 degree F
Maximum Temperature (HT option):	650 degrees F	650 degree F
Dead Band:	0.35 inch	0.35 inch
Electrical Area Classification:	Class I Div I Grp. B,C,D	

4.3.3 MOUNTING

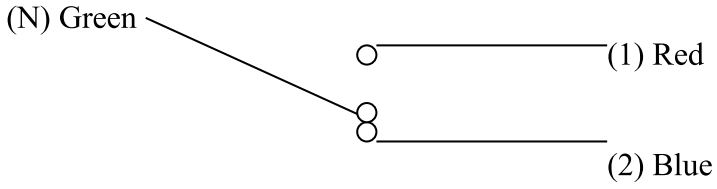
The MGS-700EX/900EX,(/2) is mounted to the MAG-GAGE® chamber with all 316 Stainless Steel worm gear pipe clamps. The switch must be mounted with TOP facing up. Rod mounted switch assemblies are available as a factory installed option. Switch points can be changed at any time by loosening the clamps and sliding the switch vertically to the desired set point.

4.3.4 OPERATION

When the switch is first installed, it is necessary to set the switch for normal operation. This is accomplished by passing the float pass the switch, the chamber can be filled with liquid so the float will pass the highest switch and then drained, or by manually sliding the switch pass the float in both directions. If the switch is being positioned above the float, the float must pass in the down direction before installation and conversely if the switch is positioned below the float.

Section 4.3.0. – Electric Level Switches (MGS-700EX(/2), MGS-900EX2(/2))

Caution: If there is a need to take the switch out of service or disconnect it for any reason, then make the sure the circuit is de-energized.
Note: Keep cover tightly closed when in operation. To prevent ignition of GRP. B atmospheres a approved sealing fitting must be installed



4.3.5 ELECTRICAL WIRING – RISING LEVEL

N/O	Red	Terminal 1(4)	Closes on rising level.
C	Green	Terminal 2(5)	
N/C	Blue	Terminal 3(6)	Opens on rising level.

4.3.6 ELECTRICAL WIRING – FALLING LEVEL

N/C	Red	Terminal 1(4)	Opens on falling level.
C	Green	Terminal 2(5)	
N/O	Blue	Terminal 3(6)	Closes on falling level.

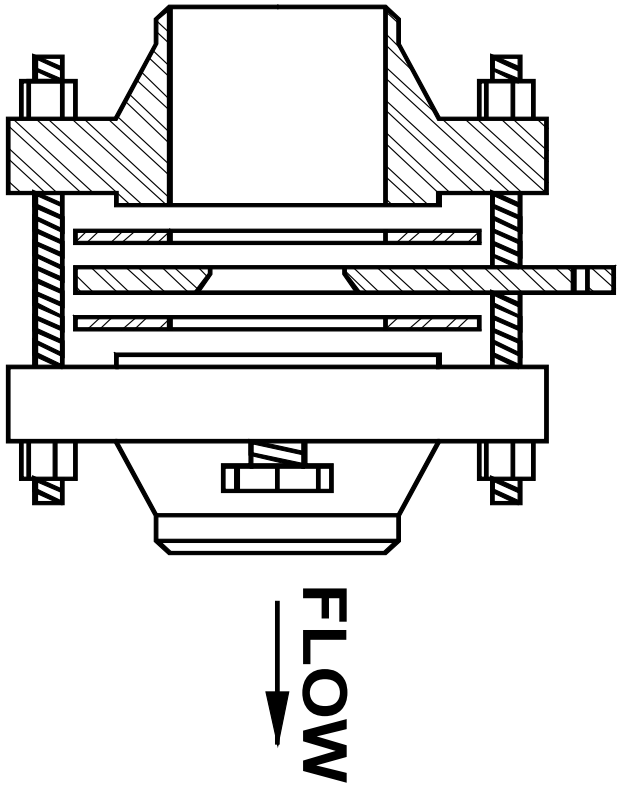
ORIFICE PLATE INSTALLATION INSTRUCTIONS

1. Make certain the pipeline is not under pressure and has been properly drained or purged as required.

2. Loosen all Studs

3. Remove the studs in one half of the flange union.

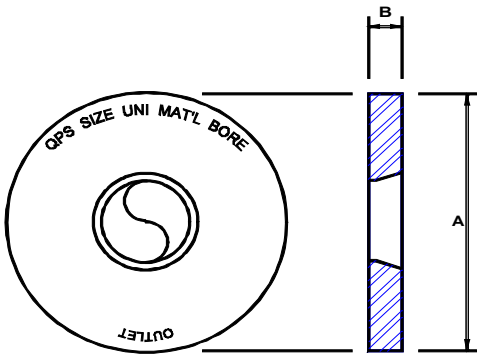
4. Spread flange union by turning jackscrews clockwise.



5. Install new plate or removed existing replacement or inspection.
(Be Sure the Beveled Side is toward the downstream)

6. Install new gaskets when installing plate. We recommend installing new gaskets each time the flange union is seperated.

7. Release the flange union by turning jackscrews counter clockwise.



8. Replace studs.

9. Tighten studs starting with two studs opposite each other.

Paddle Type Orifice Plate

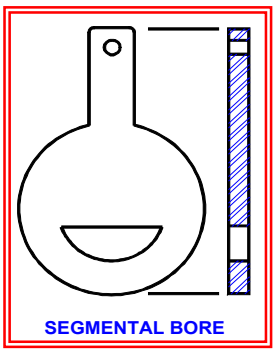
The Concentric Bore & Bevel is the most widely accepted style of Orifice Plate. The bevel is machined on the downstream side to narrow the bore edge to the appropriate edge thickness.

*** Bore & Bevels are designed for clean gases/vapors and liquids.**

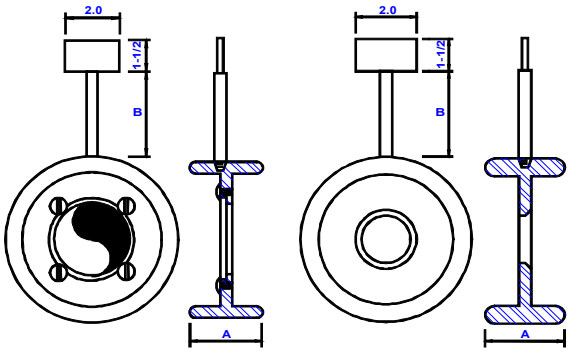


The Quadrant bored Orifice Plate is machined with a rounded inlet edge. The thickness of the plate must be at least equal to the radius. Any excess material is removed with a counter-bore on the downstream side of the plate.

*** Quadrant bores are designed for dirty, viscous and corrosive liquid**

The Eccentric bored Orifice Plate is machined off center. With the bottom of the bore setting inscribed within a circle equal to 98% of the pipe diameter.

*** Eccentric bores are designed for dirty gases/vapors and liquids with solids or slurries entrapped in the line.**



The Segmental bored Orifice Plate is machined by removing a segment of a circle. With the bottom of the bore setting inscribed within a circle equal to 98% of the pipe diameter.

*** Segmental bores are designed for dirty gases/vapors and liquids**

Quest-Tec Solutions

The New Standard of Level

Glass-Trac | Steam-Trac | Level-Trac | Mag-Trac

Liquid Level Gages and Valves

Forty years of product knowledge brings you the best the market has to offer: Quest Tec Solutions is a young company with a long lineage of quality, experience and care. The development and engineering of the liquid level gage and valve product lines began more than forty years ago.

These products have been consistently refined and improved to remain one of the industry leaders in liquid level measurement. One of the leading liquid measurement companies, Daniel Measurement and Control, directed this product development and engineering.

New management means a fresh dedication to bring you solutions: On September 27, 2001, the Daniel liquid level gage and valve product lines were purchased by Quest Tec Solutions. Quest-Tec, a wholly owned subsidiary of Baro Holdings, Inc., is managed by people that have been involved with liquid level products for over 15 years. The management and staff at Quest Tec have collective hands-on experience with all aspects of the liquid level gage and valve product line of over 150 years.

New facilities means flexibility to better meet your needs: Quest Tec relocated its manufacturing facility for better growth and flexibility across Houston to 4003-D Greenbriar, Stafford, TX 77477 with a new phone number of (281) 240-0440. This new facility has also allowed for the expansion into new product offerings such as Magnetic Level gages, High Pressure Steam gages and Electronic Boiler trim.

When choosing your liquid level measurement solution provider, why not choose the best? The symmetry of a market tried-and-true product coupled with the energy of new management, has positioned Quest Tec to be best suited to assist you solve your liquid level measurement challenges.

GLASS-TRAC LIQUID LEVEL GAGES and VALVES

ORDERING INFORMATION

Please Specify:

- Gage Size Number
- Type of Service
- Temperature Limits
- Pressure Limits
- Type of Connections
- Special Functions
- Vessel Centers if Close Hook-up

GAGE NUMBERING SYSTEM

Example: 71-RL:

7 is #7 Glass (#1 through #9)
1 is One-Section Gage (1, 2, 3, 4, . . .)
R is Reflex (T-Transparent)
L is Low Pressure Series (M = Mid, H = High, WP = Weld Pad)

(Add appropriate digits or letters to indicate special purpose gage or accessory)

HC Externally Heating/Cooling Gages
FP Frost Preventive Extensions
LC Large Chamber Gage
EP Explosion Proof Illuminator
CH Close Hook-up Connections

Carbon steel is the standard material for all Glass-Trac low, mid and high pressure liquid level gages. The percentages of carbon steel pressure ratings for optional gage materials are listed below.

GAGES

Stainless Steel 300 & 400 Types 100%
Monel, Hastelloy B & C 90%
Brass 50%

GASKETS

Special Acid Sheet Gasketing 75%
Teflon®, KEL-F® 50%
Glass Filled Teflon 100%

Teflon is a registered trademark of DuPont.
KEL-F Is a registered trademark of 3M.

All specification are subject to change without notice as part of a continuing program of product improvement.

REFLEX GAGES

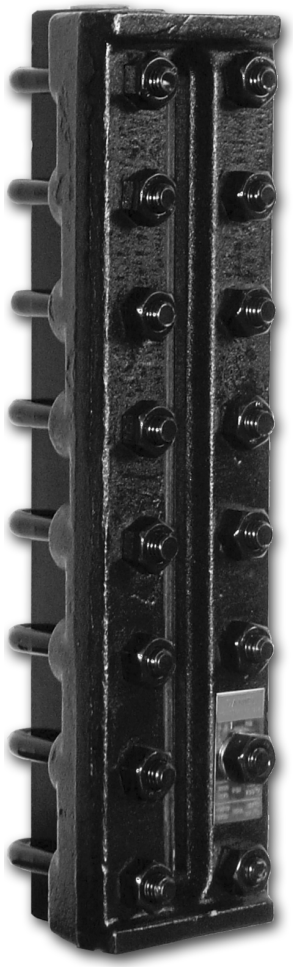
Glass-Trac Reflex Gages use prism glass to provide an excellent indication of the liquid level. All liquids appear black in high contrast to the mirror-like surface above. This clean line of separation can be sighted from many yards away. Reflex Gages are made in three pressures series (maximum 4000 psig @ 100ºF) and are tapped for ½" or ¾" NPT connections. The standard Glass-Trac level gages are designed for minimum -20ºF service.

On Glass-Trac Reflex Close Hook-up Gages with ½" NPT connections, the center-to-center dimensions is the same as the overall length on standard gages. On Close Hook-up Gages with ¾" NPT connections, the center-to-center dimensions is the same as the overall length on standard gages plus ⅜".

MATERIALS

BODY (LIQUID CHAMBER): Accurately machined from square tubes to provide perfect seating for gage glasses. Glass is recessed for protection. Body materials include 316 stainless steel and carbon steel.

COVER: Glass-Trac gage covers are made of carbon steel or 316 stainless steel in all their sizes and pressure ratings for higher strength and dependable service. All covers are machined to provide recessed seating protection for the glass.



GLASS: All standard Glass-Trac Reflex Gages use tempered borosilicate glass in nine standard lengths. Each glass has expertly molded reflecting prisms.

GASKETS & CUSHONS: High grade non-asbestos is used in gaskets and cushions for Glass-Trac gages. The machined recess in the gage body and cover protects the gasket and cushion as well as the glass.

BOLTS: Glass-Trac gage bolts are made of alloy steel, ASTM A-193 Grade B7.

NUTS: Gage nuts are made of steel, ASTM A-194 Grade 2H.

(Torque instructions for gage bolts are on the back cover.)

*Gages for service to 800º F are available. Consult the factory for the application and ratings.
** Saturated steam to 300 WSP. Above 300 WSP, use transparent gage with mica shields.

TRANSPARENT GAGES

Glass-Trac Transparent Gages use clear, see-through glass on both sides so that both the color and the interface of liquids can be viewed. Electric lighted gage illuminators are available for use on Transparent Gages and provide easy viewing of liquid levels in dimly lighted areas. Transparent Gages are made in three pressure series (maximum 3000 psig @ 100ºF) and are tapped for ½" or ¾" NPT connections. The standard Glass-Trac level gages are designed for -20ºF service.

On Glass-Trac Transparent Close Hook-up Gages with ½" NPT connections, the center-to-center dimension is the same as the overall length on standard gages. On Close Hook-up Gages with ¾" NPT connections the center-to-center dimensions is the same as the overall length on standard gages plus ⅜".

MATERIALS

BODY (LIQUID CHAMBER): Accurately machined from square tubes to provide perfect seating for gasket, and gage glasses. Both glasses are recessed for protection. Body materials include Type 316 stainless steel and carbon steel.

COVERS: Both covers on transparent gages are carefully machined to provide perfect seating for cushions and gage glasses. This machining also provides deep recessed seating in the cover for added glass protection. Covers are available in Type 316 stainless steel and in carbon steel.

GLASS: All standard Glass-Trac Transparent Gages use tempered borosilicate glass in nine standard lengths. Each transparent glass is crystal clear and has the highest strength possible.

GASKET & CUSHIONS: High grade non-asbestos is used in gaskets and cushions for Glass-Trac gages. The machined recess in the gage body and cover protects the gasket and cushion as well as the glass.

BOLTS: Glass-Trac gage bolts are made of alloy steel, ASTM
A-193 Grade B7.

NUTS: Gage nuts are made of steel, ASTM A-194 Grade 2H.

(Torque instructions for gage bolts are on Back Cover.)

3200 psi	400º F		

Glass-Trac Type 1 & 2 Offset Gage Valves are available with screwed (S), union (U), (illustrated below) and tubular (T) gage connections (Page 15). Both 1 and 2 Valves are used with Reflex and Transparent Gages in working pressures up to 4000 psi and with Tubular Gages to their maximum rating. The Teflon packing ring is standard and used in services up to 450º F. For temperatures to 700º F, valves are fitted with special wire graphite packing. Both valves have stainless steel ball checks to shut off the flow automatically in case of gage glass breakage.

The "offset" feature permits easy cleaning of gages. A floating tailpiece on Type 1 valves permits an overall vertical adjustment of 1/8" if the gage center-to-centers are not precisely located. Installation is quicker and gage strain is eliminated.

Type 2 Valves have an optional backseating stem allowing the packing to be changed without shutting down the vessel.

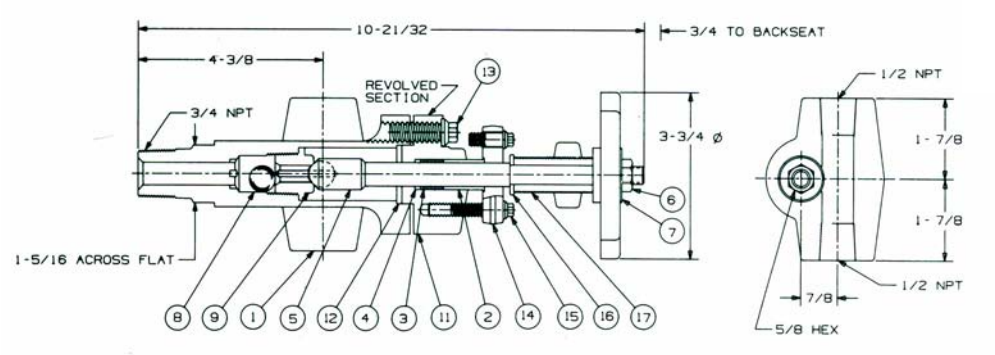
The Glass-Trac Type 3 Offset Gage Valve has the Outside Screw & Yoke design which prevents excessively hot and corrosive fluids from contracting stem threads, causing possible malfunction. The stem backs directly off the regrindable valve seat using the positive, non-rotating stem principle. The valve is offset for ease in gage cleaning and comes in both screwed (S) and a union (U) gage as standard. On special order, tubular (T) gage or other type connection can be supplied. Type 3 valves are used with Reflex and Transparent Gages in working pressures up to 4000 psi.



The standard tank connection for Type 3 OS&Y Offset Gage valves is a ¾" NPT solid shank, with optional ½" and 1" NPT sizes. Ends beveled for welding also are available. Valve materials include forged carbon steel and 316 stainless steel. A molded Teflon packing ring is standard at no extra cost in valves for services up to 450º F. For temperatures to 700º F, valves have wire-graphite packing. The Type 3 valve has stainless steel safety ball checks to shut off the flow automatically in case of gage glass breakage.

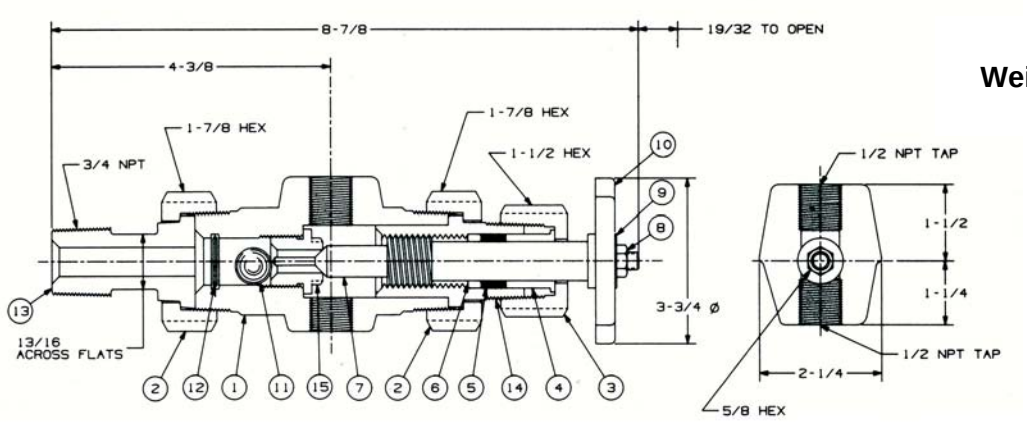
3200 psi	400º F		

The Glass-Trac Type 4 Straight-Thru Gage Valve is available with screwed (S) and Union (U) gage connections and used with Reflex and Transparent Gages in working pressures up to 4000 psi. The "straight-thru" valve body design is popularly used with close hook-up (side connection) gages because the gage side connection centers and vessel centers can be identical. (With offset valves, vessel centers must be inside or outside side connection centers.) Type 4 Valves have a ¾" NPT Male Tank Connection as standard, with other connections available on order.



Type 4 Straight-Thru Gage Valves are stocked in carbon steel with stainless steel trims. A molded Teflon packing ring is standard at no extra cost in valves for services to 450ºF. For temperatures to 700º F, valves have wire-graphite packing. The Type 4 Valve has stainless steel ball checks to shut off the flow automatically in case of gage glass breakage. An optional back seating stem is available on request.

The Glass-Trac Type 5 Gage Valve has the Outside Screw & Yoke design which prevents excessively hot and corrosive fluids from contacting stem threads, causing possible malfunction. The stem backs directly off the regrindable valve seat using the positive, non-rotating stem principle. The valve has a "straight-thru" body design and, with an optional bleed valve, can be used in a block and bleed application. Standard gage connections are screwed (S) and union (U) but any other type connection can be supplied on special order.

The standard tank connection for Type 5 OS&Y Straight-Thru Gage Valves is a ¾' NPT solid shank, with optional ½" and 1" NPT sizes. Ends beveled for welding also are available. Valve materials include forged carbon steel with stainless steel trims. A molded Teflon packing ring is standard at no extra cost in valves for services up to 450ºF. For temperatures to 700ºF, valves have wire-graphite packing. The standard Type 5 Valve has a back seating stem that allows the packing to be changed without shutting down the vessel. Stainless steel ball checks are available upon request.

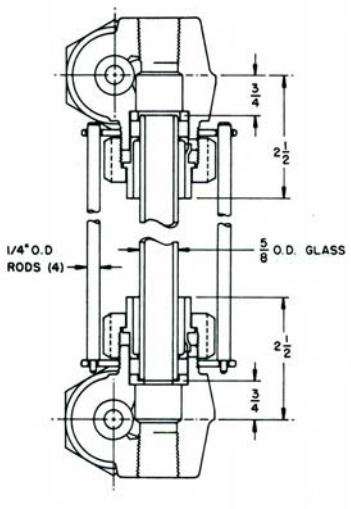
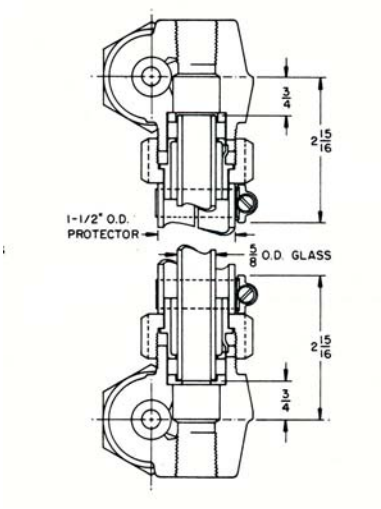
TUBULAR GAGES AND VALVES

⅝” O.D. Glass Standard, ¾” O.D. Glass Optional

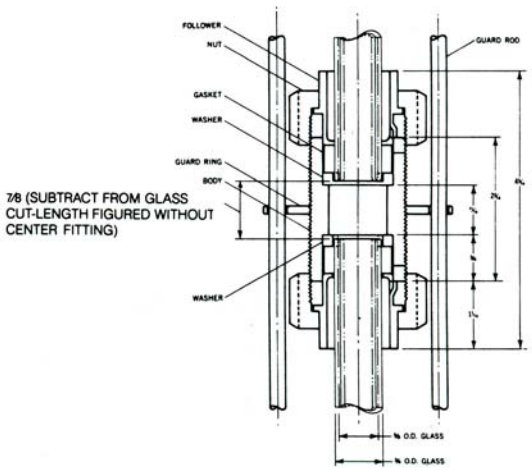
Shown with Type 2T valves



Glass-Trac Tubular Glass Gages are available in any length desired and can be fitted with Type 1T or 2T Gage Valves (see Page 18). These gages provide 360º visibility of the liquid level through strong, clear glass. Tubular glass is used in three types: Red Line, High Pressure and Heavy Wall. Pressure ratings are different for each type and also depend upon glass length (see next page). If glass breakage occurs, a stainless steel ball check shuts off each valve. Glass tubes should be cut 1½” shorter than valve center-to-center. The resulting visible glass length is 5” less than the valve center-to-center.



Red Line glass provides a bright crimson stripe against a narrow white strip throughout the length of the tube. Liquid levels are easy to see against this special optical effect. The glass is heat-resistant and ends are fire polished. Red Line is available in both ⅝” and ¾” O.D.



High Pressure glass is a versatile, medium-strong type of tube used in many applications. It is crystal clear and ends are fire polished.

Heavy Wall glass has the highest pressure rating of all tubular glass. It is extremely clear, corrosion resistant, will not scratch easily and is extra resistant to heat shock. Ends are ground.

Four carbon steel guard rods and two guard rod rings are used to protect tubular glass gages. The rods are anchored in each ring which is fastened to the valve behind the union nut. Rods should be cut 1¾” shorter than valve center-to-center. A transparent plastic sheath also is available to clamp around the glass tube. Sheath length should be 4 ⅜” shorter than valve center-to-center. Also available is an expanded metal gage glass protector for additional protection of the glass. Specify gage valve center-to-center for proper sizing of this assembly.

CENTER FITTING
(Recommended when valve centers exceed maximum recommended service length)

NOTE: ***Type 1T 4000 psi Tubular Valve and Type 2T 4000 psi Tubular Valve shown on page 15.***

TUBULAR VALVES (Brass)

½" NPT Male Tank Connection
⅝" O.D. Tubular Glass Gage Connection

For low pressure water vessels, storage tanks, containers, etc., Glass-Trac provides Type OT Brass Valves for Tubular Gages. The valves are made up with 5/8" O.D. Pyrex Red Line, High Pressure or Heavy Wall Glass from stock. Each valve contains a brass ball check which closes the valve in the event of glass breakage. Two guard rods are used. The lower valve also is fitted with a threaded drain cock. Type OT Brass Valves are suitable for working pressures up to 200 psig at or under 400ºF.

Tubular glasses are available in any length and should be cut 1½" shorter than valve center-to-center. Guard rods should be ¾" longer than the valve center-to-centers.

Visible length is 3" less than the valve centers.

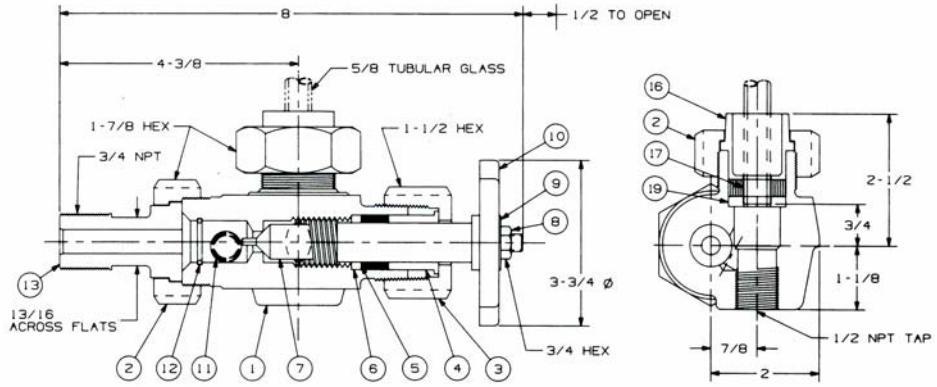
TUBULAR VALVES

Type 1T & 2T

4000 psig CWP 6000 psig Test
¾" NPT Male Union Tank Connection
⅝"O.D. Tubular Glass Gage Connection
½" NPT Female Drain Connection

Glass-Trac Offset Tubular Gage Valves are identical to Type 1 and 2 S and U Valves except they are fitted with the ⅝" O.D. tubular glass connection. The Type 2T Valve also can be furnished in the coarse thread design and with quick-operating lever for remote operation by chain. Both valves have a molded Teflon packing ring and rubber glass gaskets as standard for services up to 250º F. For temperatures to 425º F, valves have wire-graphite packing and Viton® glass gaskets. In the event of tubular glass breakage, a stainless steel ball check closes the valve to prevent further loss of fluid.

PRESSURE - TEMPERATURE RATING			
Teflon Packing		Wire-Graphite Packing	
4000 psi	100 F	3470 psi	300 F
3730 psi	200 F	3200 psi	* 400 F
3600 psi	250 F	3150 psi	425 F



NOTES: ***These ratings are for the valves only and not the tubular glass gages. See glass gage ratings on page 14.***

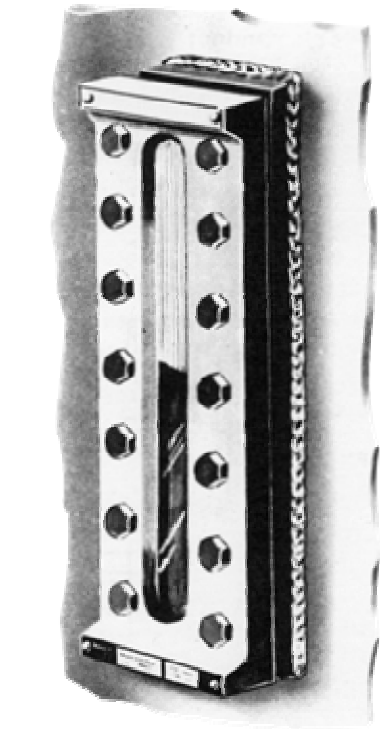
Weight per set approximately 11 lbs. 12ozs.

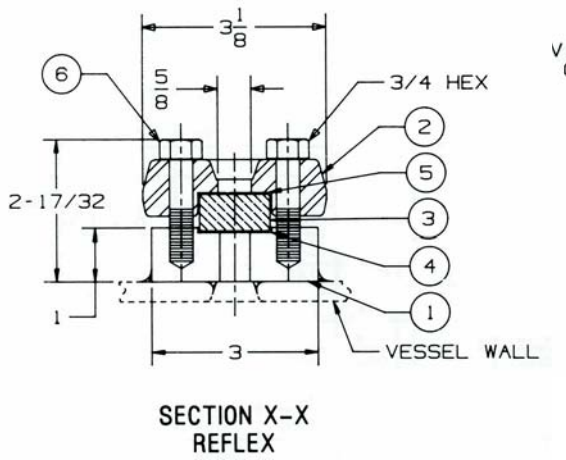
Optional Tank Connections shown on pages 26 and 27. Optional Gage Connections shown on page 25.

SPECIALTY GAGES:

Welding Pad

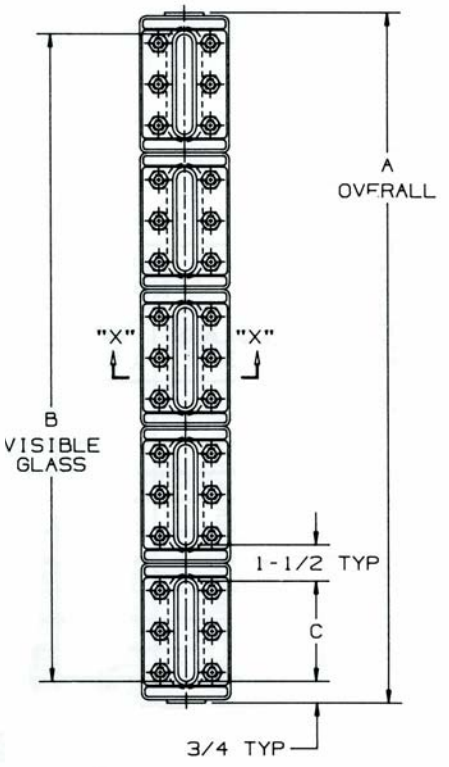


Glass-Trac Welding Pad Gages are used when standard tank connections cannot be used or when the liquid has solids in suspension. The gage becomes an integral part of the vessel because it is welded right onto the outer wall. Reflex or Transparent glass is used in any of nine standard lengths. Standard covers are 3⅛" wide. **NOTES:** Welding pad gages to be used on vessels less than 36" in diameter must be special ordered. The welding pad body must be machined to allow proper fit up.



Method of Installation:

1. Assemble complete gage with spacer plate (available on request) in place of gage glass.
2. Place gage in exact location desired on empty vessel and weld around circumference of the pad.
3. Allow gage to cool, then remove cover and spacer. Drill or burn top and bottom holes in vessel wall at the top and bottom of each gage slot. Slot is ⅝" wide.
4. Replace gage glass, gasket, cushion and cover. Torque bolts to prescribed foot/pounds.



NOTES: While the gage itself can be designed to withstand certain pressures. Glass-Trac cannot control the installation of each gage or the load applied to the gage by the vessel. Because of this, Glass-Trac cannot rate Weld Pad Gages.

When ordering, add WP to gage size number.

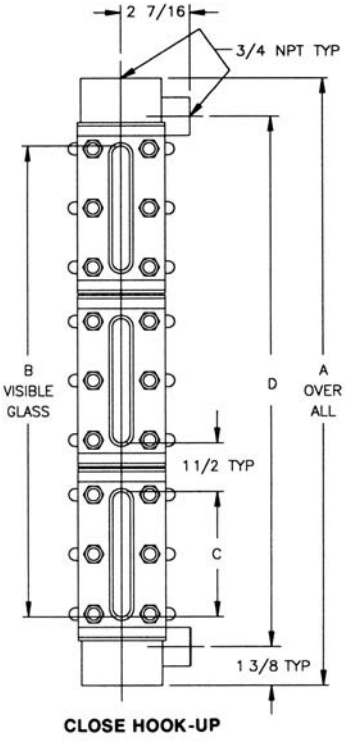
SPECIALTY GAGES:

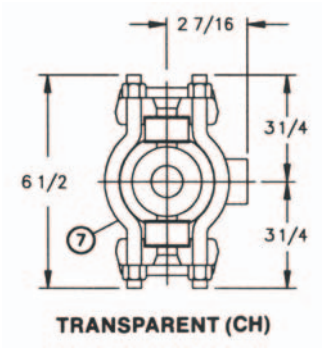
Large-Chamber

Example: 71 RL-LC (No.7 glass, 1-section, Reflex, Low Pressure, Large Chamber)



Glass-Trac Large Chamber Gages are made in a special low pressure series of both Reflex and Transparent Gages. The large diameter chamber makes accurate liquid level readings possible under unusual conditions such as boiling, flashing, or foaming of the liquid. The chamber is manufactured from heavy duty seamless steel pipe with an inside diameter of 2⅛". Each end of the pipe is closed off with a welded plug which is drilled and tapped for ¾" NPT connections. For close hook-ups, ¾" NPT side connections are made and ends may be drilled, tapped and plugged for cleaning as required.

Recessed seats are machined into the liquid chamber and gage covers for protection of glass, gasket and cushion. Special bolts are used. Large Chamber Gages are made in lengths for standard flat glasses and multiple section gages are available.



When ordering, add LC for large chamber to gage size number and CH for close hook-up.

SPECIALTY GAGES:

Heated/Cooled Externally

Example: 71 TL-HC (No. 7 glass, 1-section, Transparent, Low Pressure, Externally Heated/Cooled Gage)

Also available in close hook-up (CH) and internally heated/cooled type.

Glass-Trac Externally Heated/Cooled Gages may be either low Pressure or Mid Pressure or Mid Pressure, Reflex or Transparent and have ½" or ¾" NPT Connections. Pressure-temperature ratings and sizes remain the same as standard flat gages.

On externally heated/cooled gages a metal tube is employed to transmit heating or cooling fluid. The tubing starts from an adaptor nut on one valve, passes along a machined groove in the gage body wall and connects to the adaptor nut in the opposite valve. Fluid piped through the tubing serves as the heating or cooling media. Gage bodies (liquid chambers) are made extra long to accommodate the groove and tubing.

Most common heating fluids are steam and hot water. To cool gages, methane, propane, freon and ammonia refrigerants are used.

The adaptor nut on the gage valves can be fitted with either a ½" NPT Female Tank connections or a ¾" NPT Male Tank connection. Valve Types 1,2 and 4 may be used.

When ordering Glass-Trac Externally Heated/ Cooled Gages, add HC to the gage size number.

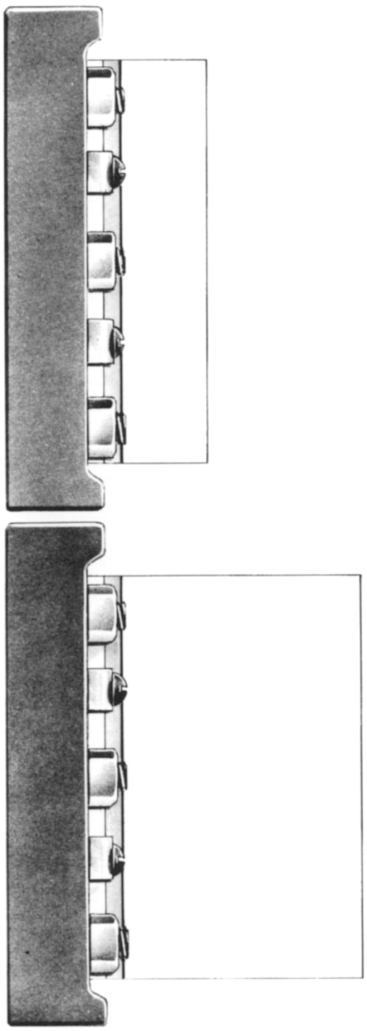
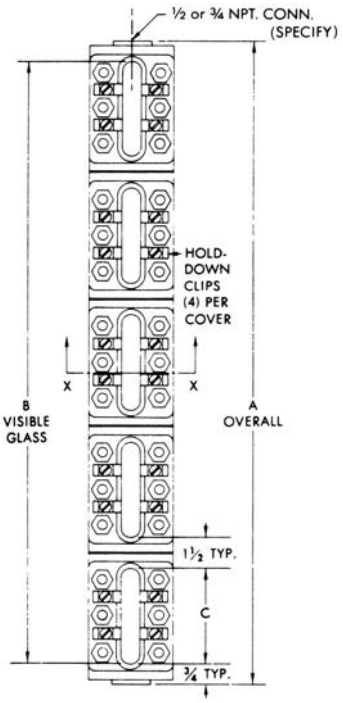
SPECIALTY GAGE:

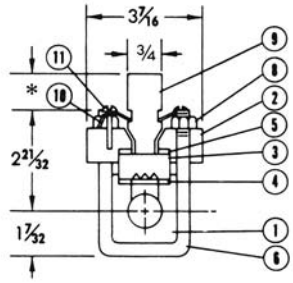
Frost-Prevention Extensions

Example: 81 RL-FP w/ 3⅝" extensions (No.8 glass, 1-section, Reflex, Low Pressure, Frost Preventive Gage with 3⅝" extensions).

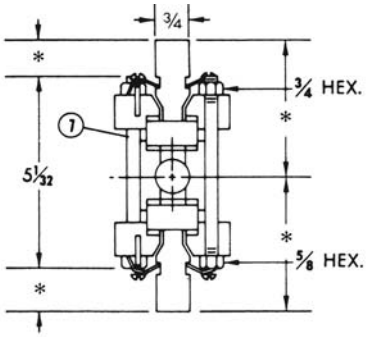




Glass-Trac plastic extensions for flat gage glasses prevent frost from forming in the liquid level view slot in low temperature services. Reflex and Transparent Gages in all pressure ratings can be fitted with plastic extensions.



Projecting from the view slot, the clear plastic extensions keeps the liquid level indication clearly visible. Stocked extensions are 1⅝" and 3⅝" in length. If the gage is thickly insulated, longer extensions are available. The extension is held in place by stainless steel clamps fastened to the gage cover. For extra low temperature services, Glass-Trac gages can be made of special metals.



Recommended length for Frost Preventive Extensions: 1⅝" extension is standard from 80ºF ambient to 0ºF temperature. Add 1" extension length for each 100º F below 0º F.

When ordering, specify length and add FP to gage size number.

*Depends on Extension Length

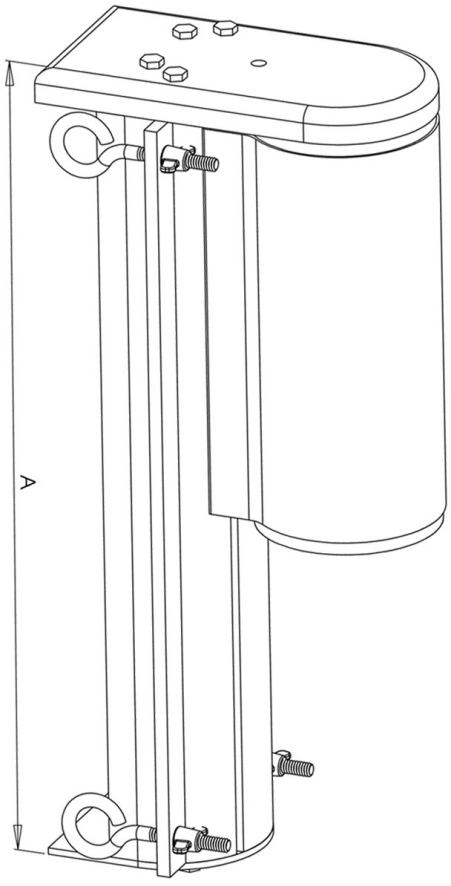
*Saturated steam to 300 WSP

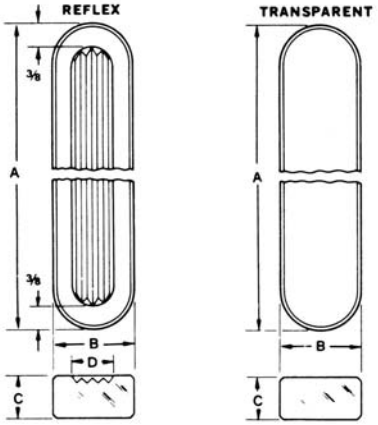
**Maximum saturated steam 600 WSP with mica shields

GAGE ACCESSORY:



Illuminators (Explosion-Proof)

The Quest-Tec Solutions ***See-Level™*** LED Illuminator for hazardous locations utilizes the latest technology to provide brilliant green back lighting to any process gage. Innovative circuitry allows for the use of an individual light source every ½" along the length of any gage. With a life span of over 100,000 hours each, light source is likely to never need replacing. Even in the event of an individual lamp failure, the design provides lighting overlap ensuring that the fluid level is always illuminated. All of this is accomplished with a meager 5 watts of power usage.



Through the use of new attachment techniques, the ***See-Level™*** Illuminator readily mounts to any brand of existing or new process gages in a matter of minutes without the loosening of any cover bolting. Mounting requires no special tools or modifications to the existing structure. Set it up, attach the power and go! It's that easy.

The modular design allows for a single illuminator to be manufactured to your specific visible length eliminating the labor involved in mounting and wiring multiple illuminators.

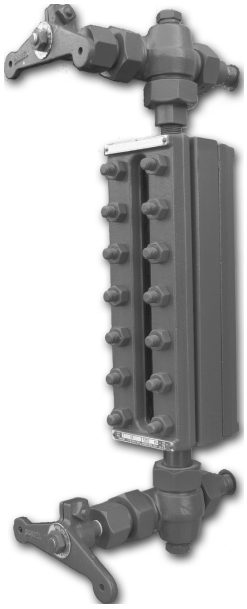
Glass-Trac standard gage glass is made of borosilicate glass. For higher temperature service or requirements, aluminosilicate glass can be supplied.

Mica shields are available for use with Transparent Gages in steam boiler service enabling glass to be used in higher pressures. They are placed between gasket and glass. KEL-F® shields are available for use with Transparent Gages in corrosive service.



NOTE: For cyclic temperature applications, or to aid in torque retention, spring washers are available upon request.

NOTE: For multiple section level gages, add "C" volume for each additional section. "C" is volume between gage sections.

QUICK-OPENING LEVERS

Glass-Trac Gage Valves are available with a coarse thread stem design and levers for fast, remote operation by chain. Only ¼ turn of the lever opens or closes the valves, which may be mounted in hard-to-reach areas. A ¼" hole is drilled in the end of each lever for connecting the chain.

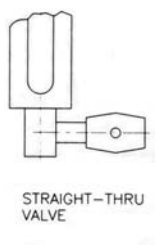
*Dimensions in column "D" apply to low-pressure (series "L"), mid-pressure (series "M"), ½" NPT high-pressure (series "H"), frost-free (all series), and internally heated/cooled reflex and transparent level gages tapped ½" NPT or ¾" NPT. For installation dimensions on other level gages see footnote.

**These dimensions use close pipe nipples. For short ½" nipple add ¾"; for short ¾" nipple add 11/4".



Note: Use the following constants for other level gages.

1. Low pressure (series "L") large chamber, add 1" to above "A" and "D" dimensions.
2. Low-pressure (series "L"), mid-pressure (series "M") externally heated/cooled, add 2¼" to above "D" dimensions.
3. For valve Types 3, 5, or 7, add ⅞" to Column "D" to obtain minimum centers.
4. For High Pressure (series "H") with ¾" NPT, add 1½" to dimensions "A" and"D".
5. For a ½" NPT Female Spherical Gage connection (Figure XXIX), add 1⅞".

STRAIGHT–THRU VALVE

CLOSE HOOK–UP WITH HANDLE INSIDE

CLOSE HOOK–UP WITH HANDLE OUTSIDE

CAUTION

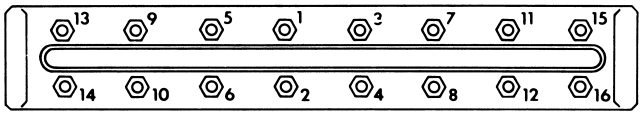
Gage glasses may fail from improper external mechanical stress or accident rather than from internal pressure, but both factors should be considered. Four basic precautions when heeded will assure the gage glass user of safe, satisfactory performance:

1. Proper glass selection
2. Correct installation.
3. Periodic inspection and cleaning.
4. Replacement as necessary.

Proper glass selection involves size, pressure rating and quality of glass. Flat and tubular glasses should fit perfectly without stress; glass should be crystal clear and without blemish; length determines pressure rating; if longer glass results in breakage, a multiple-section gage with shorter glasses should be considered.

Installation involves proper seating on gaskets and cushions; glass-to-metal contact should not occur; do not install any glass with scratches or chipped edges; do not tighten gage bolts when gage is in use; use torque instructions provided with gage; use gage valves with ball checks that shut-off automatically if breakage occurs; make sure vessel center-to-centers are correct and vertical.

Proper tightening of bolts with torque wrench is extremely important, so that no unusual stress is introduced into the glass.



Clean outside of glasses with ordinary glass cleaners, not harsh chemicals; check for scratches, chipped edges on glass; inspect glass for clarity.

Glass should be replaced if any blemish mars surface. If gage is taken apart, glass, gaskets and cushions should be automatically replaced to reduce risk; make sure gage or tubular valves surfaces are clean and dry before installing glasses.

For safety purposes, glasses in high temperature service should be replaced more often than similar glasses used in low temperature services.

GLASS-TRAC GAGE ASSEMBLY

(Numbers Indicate Proper Bolt Torquing Sequence.)

Gage Series	Torque (Tighten in 4-5 Ft.-Lb. Steps)
Low Press. Large Chamber	20 Ft.-Lb.
Mid-Press	32 Ft.-Lb.
High-Press	40 FT.-Lb.

Level Switches

General Instructions

Level Switches are available for a range of industrial applications. ATEX/IECEx-certified options for potentially explosive atmospheres are available for both flameproof and intrinsically safe protection.

NOTE: If you suspect that a product is defective, contact the factory or the SOR® Representative in your area for a return authorization number (RMA). This product should only be installed by trained and competent personnel.

700 Series Top-Mounted Displacer

100 Series Flanged Chamber

200 Series Sealed Chamber

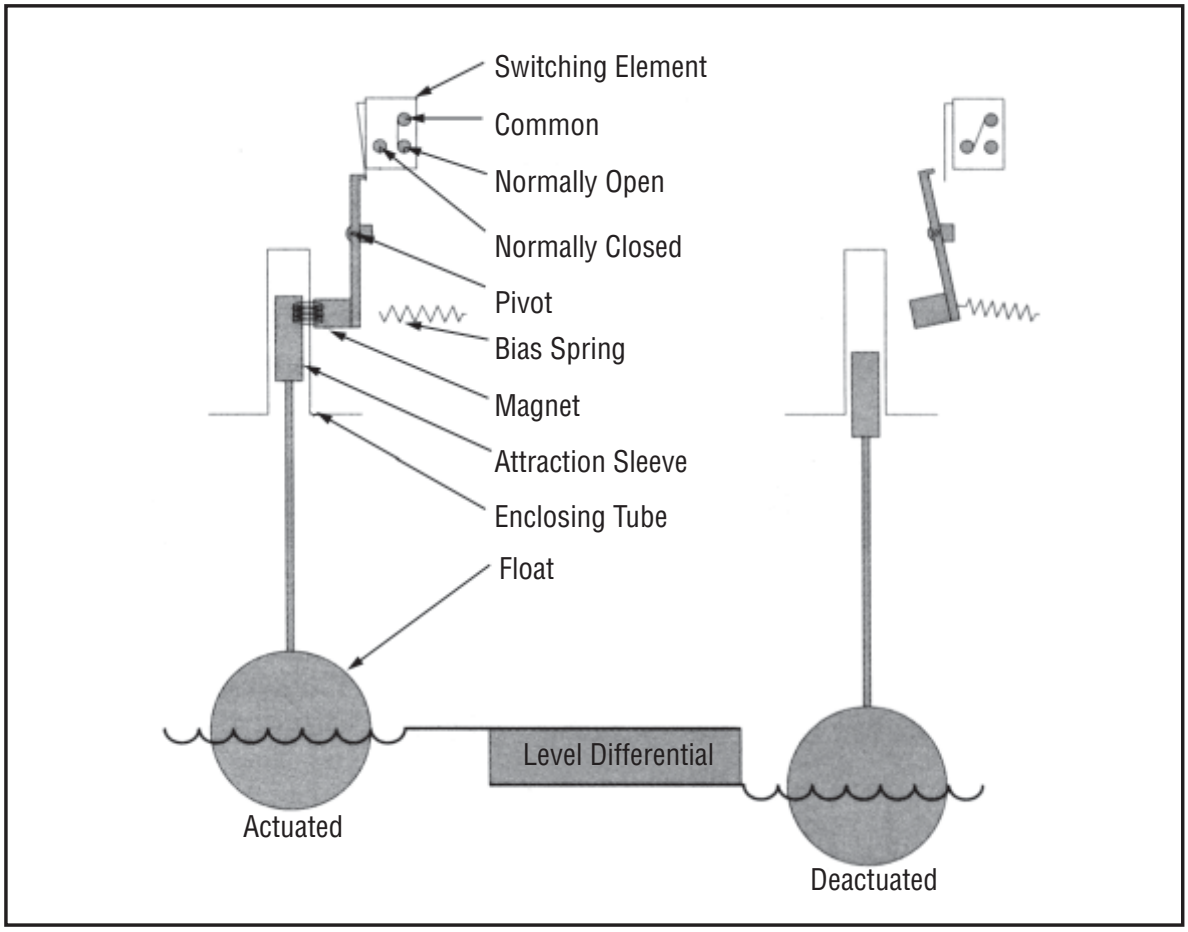
Float-Operated Level Switches - Vertical



Operation

- The float rides on the process liquid surface, precisely tracking liquid surface motion.
- Floats are attached to a mechanical linkage. When rising liquid level meets the float, buoyancy lifts the linkage and positions the attraction sleeve up in the enclosing tube. Upward movement of the attraction sleeve positions it within the magnetic field generated by the external magnet.
- Magnetism pulls the external magnet in toward the attraction sleeve, and the external magnet is tightly engaged against the enclosing tube actuating the switching element.
- When liquid level falls, the attraction sleeve drops out of the magnetic field allowing the float to pull the magnet away from the enclosing tube, deactuating the switch.

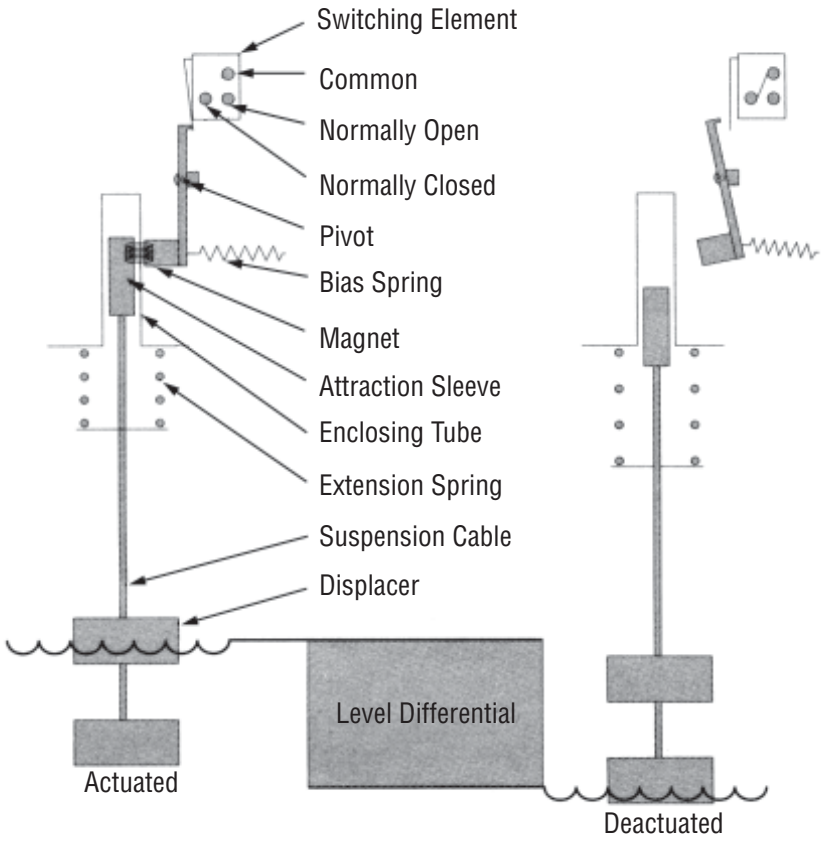
NOTE: Float-type level switches are generally able to be used in high-temperature applications, and sometimes prove useful for close interface detection.

NOTE: Floats are able to operate up to three switching elements. Independent switching levels can be obtained with tandem floats. Consult the factory for special float switching arrangements.

Float-Operated Level Switches - Vertical

Form 425 (09.16) ©SOR Inc.

Displacer-Operated Level Switches - Vertical



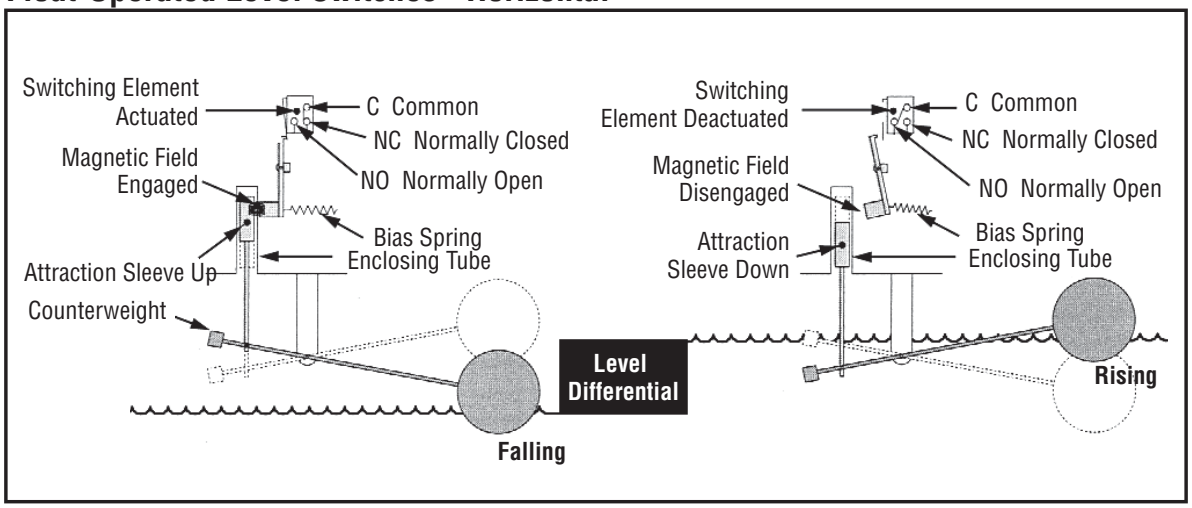
Operation

- Displacer controls offer alternate features to the float-operated control. The sensor is a weight (displacer), heavier than the liquid, which is suspended by a spring.
- When liquid contacts the displacer, a buoyancy force is produced, which causes the effective weight of the displacer to change. This causes the spring to retract slightly to a new equilibrium position.
- When the spring retracts, the attraction sleeve also moves upward into the field of the external magnet, thus overcoming the force of the bias spring and actuating the switching element. The switching mechanism operates the same as with vertical float-operated level switches.

NOTE: This principle provides for narrow or wide switching differential, and allows switching point alteration by moving the displacer(s) up or down the suspension cables.

NOTE: Displacers can be arranged in combinations of narrow and wide differential to operate up to three switching stages. Displacer controls operate under higher pressure conditions than float-operated switches.

Displacer-Operated Level Switches - Vertical



Float-Operated Level Switches - Horizontal

Operation

The float rides on the process liquid surface, precisely tracking liquid surface motion. Rising liquid level lifts the float via a pivot mechanism, sliding the attraction sleeve down inside the enclosing tube and out of the magnetic field to deactuate the electrical or pneumatic switch (signaling liquid presence).

Float-Operated Level Switches - Horizontal

Falling Level

- The float is connected to a mechanical linkage which positions the attraction sleeve up in the enclosing tube when the float is not supported by liquid.
- Positioned at the top of the enclosing tube, the attraction sleeve is within the magnetic field generated by the external magnet.
- Magnetism pulls the external magnet in toward the attraction sleeve, and the external magnet is tightly engaged against the enclosing tube.
- While the external magnet is held against the enclosing tube, the switching element is actuated.
- Subsequently, falling liquid level lowers the float, drawing the attraction sleeve into the magnetic field to activate the electrical or pneumatic switch (signaling liquid absence).

Rising Level

- When the float is supported by liquid, the float and the mechanical linkage position the attraction sleeve down in the enclosing tube.
- Positioned at the bottom of the enclosing tube, the attraction sleeve is outside of the magnetic field generated by the external magnet.
- When the attraction sleeve is removed from the magnetic field, the magnetic field is disengaged. The bias spring snaps the external magnet away from the attraction sleeve. The switching element is deactuated.

Form 425 (09.16) ©SOR Inc.

Switch and Switch Chamber Installation

- Verify that obstructions are not present in the application which would prevent free float or diaplacer movement throughout the entire range of motion.
- Assure that mounting provides vertical alignment of the switch. For proper operation, the unit must be mounted with the electrical housing and enclosing tube centerline within 3º of vertical. The conduit connection centerline must be within 3º of horizontal.
- Controls operating in liquids which tend to leave deposits in the piping should incorporate tee or cross type fitting to allow periodic cleaning of the process piping. A drain or blow-down valve will assist in cleaning the control chamber and piping.

External Chamber Installation

- Pipe support hangers or stands should be used where necessary.
- All isolation valves must be fully open during service, as restricted valves may cause erroneous level switching.

Single Switch Chamber

- External chamber piping should be short, straight and unrestricted.
- Pipe must be of a diameter equal to or greater than the process connection diameter.
- Valves and other equipment between the chamber and process must be of the same diameter or larger than the process connection diameter to allow adequate liquid flow into the chamber.

Multiple Switch Chambers

In addition to the Single Switch installation instructions, multiple chamber installations have the following requirements:

- Headers connecting multiple chambers to the process connection must be larger than the chamber process connection diameter to allow adequate liquid flow to all chambers. Multiple chamber diameters are listed below:
  - two chambers should be 1.5 times larger
  - three or four chamber installations should be 2 times larger
  - five or more chamber installations should be at least 2.5 times larger.
- Valves, tees, elbows and other pipe fittings in a header must be the same diameter as the recommended header diameter.

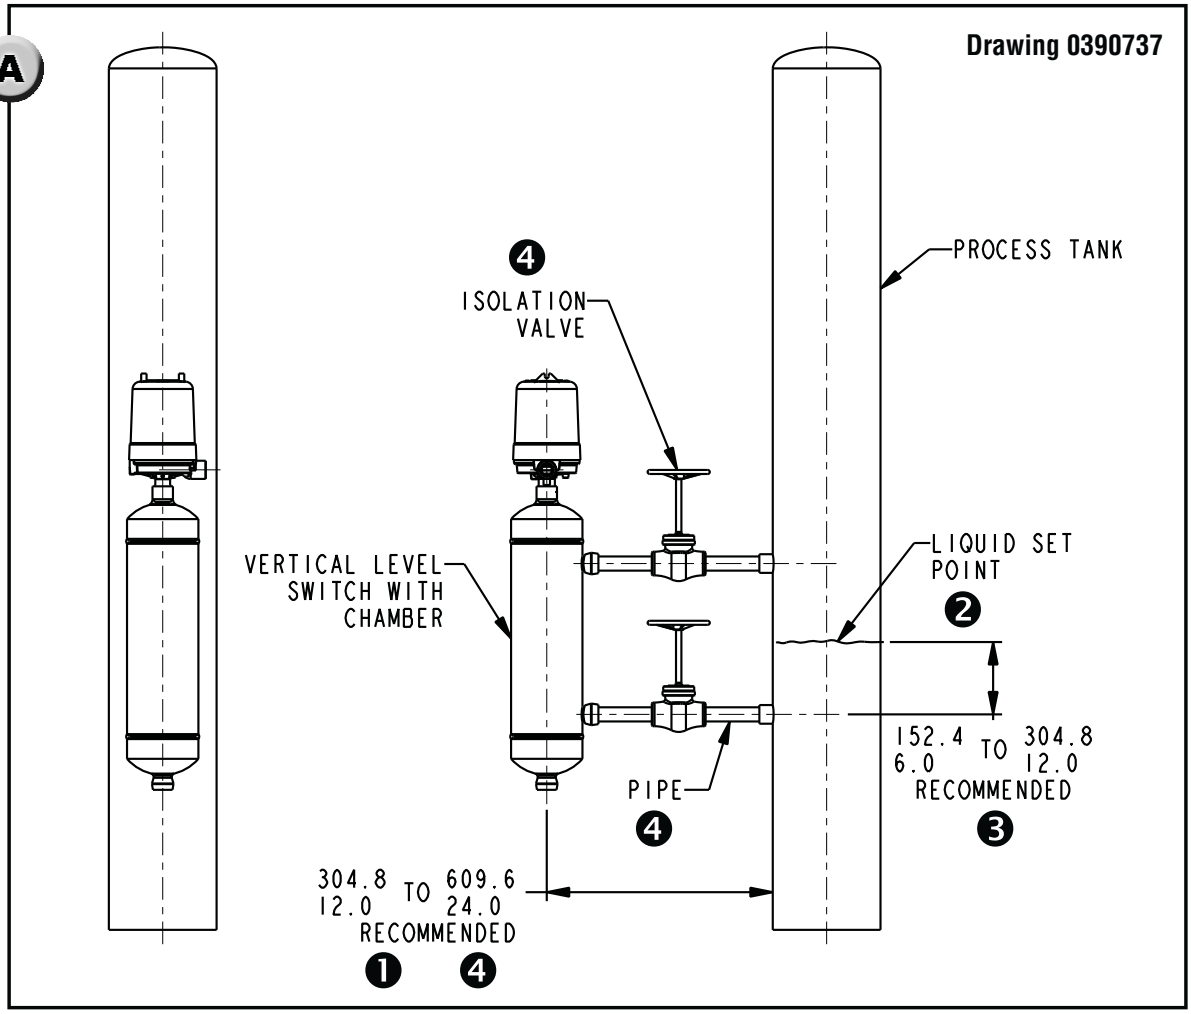
Not following these installation instructions, including pipe and valve diameter and pipe lengths can affect operation of the switch, including differential. See Single Switch Chamber Installation (A) and Multiple Switch Chamber Installation (B).

Insulation of the control chamber is acceptable, but temperature extensions, finned extensions and switch housing and cover must not be insulated.

Single Switch Chamber Installation

❶ Locate switch chamber process connection 12” to 24” (300mm to 600mm) away from the process pipe or tank.

❷ Locate the switch chamber so that the switch actuates or deactuates at the desired level. Refer to catalog for set point information.



❸ For bottom chamber connections, connect the bottom chamber process connection to the process pipe or tank 6” to 12” (150mm to 300mm) below the centerline of the chamber. For side chamber connections, pipe directly to the process pipe or tank. This will ensure liquid level in the switch chamber is as close as possible to process liquid level.

❹ Inside diameter of piping, including elbows, tees and valves, must be equal to or greater than process connection diameter.

❺ One elbow is recommended to connect the level switch chamber with the process pipe or tank (if required).

A

Drawing 0390737

IMPORTANT

Deviating from any of these instructions may adversely affect operation of the level switch by restricting liquid flow into the switch chamber. The recommended dimensions allow adequate space for isolation valves, pipe fittings and insulation. Structural support (not shown) must be provided for level switch chambers.

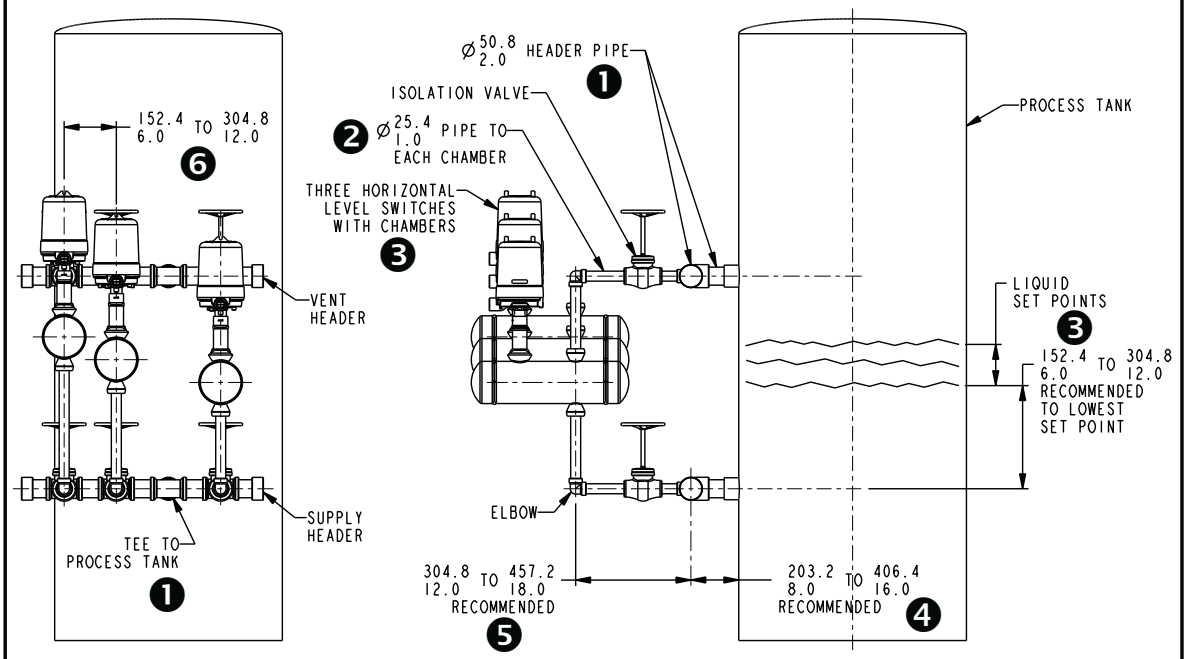
Form 425 (09.16) ©SOR Inc.

Multiple Switch Chamber Installation

❶ The header pipe diameter for three (3) or four (4) chambers needs to be two times the process connection diameter. For 1" (25mm) process connections, the pipe header must be 2" (50mm) in diameter. This includes pipe connecting the header to the process, fittings, valves and other pipe equipment installed as part of the header piping. Headers should be arranged to use one elbow or tee to connect to the process pipe or tank.

❷ Pipe connecting the header to individual chambers can be the same size as the process connection on the switch chamber. Fittings and valve diameters must also be equal to or greater than the process connection diameter. One elbow is recommended to connect the level switch chamber to the header pipe.

❸ Install each chamber so that the actuate or deactuate point is at the desired process liquid level. Refer to catalog for set point locations.



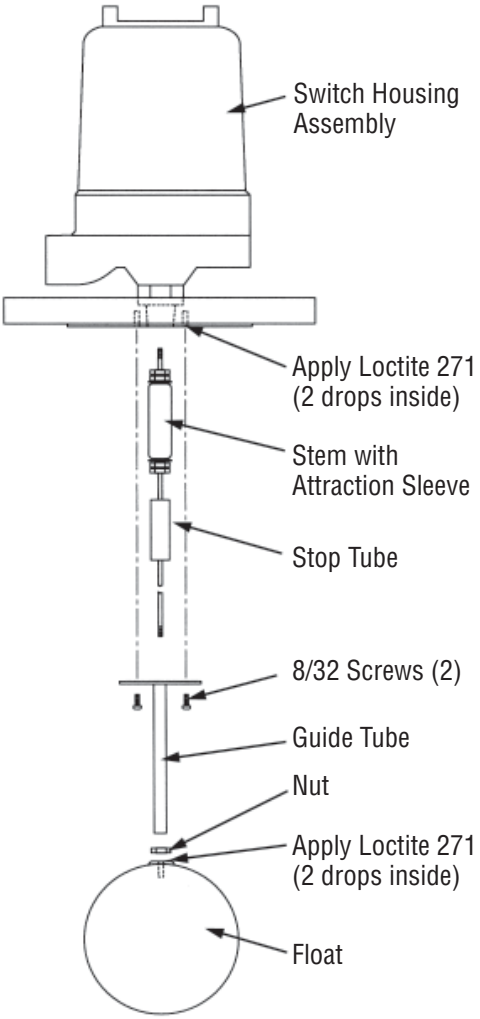
❹ Locate the header 8" to 16" (200mm to 400mm) away from the process tank.

❺ Locate switch chamber process connection 12" to 18" (300mm to 450mm) away from the header pipe.

❻ Horizontal spacing of level switch chambers should be 6" to 12" (150mm to 300mm).

B

Drawing 0390737



IMPORTANT

Deviating from any of these recommendations may adversely affect operation of the level switch by restricting liquid flow into the switch chamber. The recommended dimensions leave adequate space for isolation valves, fittings and insulation. Structural support (not shown) must be provided for level switch chambers.

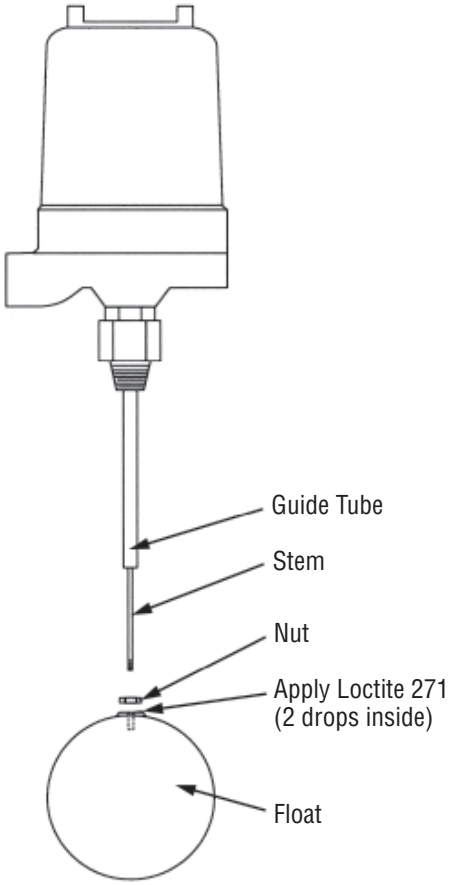
Float Attachment

Flanged Process Connection

❶ Place the Stem with Attraction Sleeve inside the flange of the Switch Housing Assembly.

❷ Place the Stop Tube over the Stem.

❸ Place two drops of Loctite 271 inside each small threaded hole in the flange bottom.



❹ Slide the guide tube into place so that the stem goes inside.

❺ Attach the Guide Tube to the flange using the 8/32 screws (qty 2). Do not over-tighten.

❻ Thread the nut onto the exposed end of the stem.

❼ Place two drops of Loctite 271 inside the threaded hole of the float.

❽ Holding the stem with pliers, thread the float onto the stem and hand-tighten. Thread the nut down against the float and tighten securely.

Threaded Process Connection

❶ Remove the protective rubber plug from the end of the Guide Tube and Stem.

❷ Thread the nut onto the exposed end of the stem.

❸ Place two drops of Loctite 271 inside the threaded hole of the float.

❹ Holding the stem with pliers, thread the float onto the stem and hand-tighten. Thread the nut down against the float and tighten securely.

Form 425 (09.16) ©SOR Inc.

Electrical Wiring Instructions

Electrical power must be disconnected from explosion proof models before the cover is removed. Failure to do so could result in severe personal injury and/or substantial property damage.

- Ensure that the wiring conforms to all applicable local and national electrical codes and install unit(s) according to relevant national and local safety codes.
- Switch housing conduit connections may be rotated 360° by loosening the set screw located under the housing base. Do not attempt to rotate without following this instruction and loosening the set screw. Retighten the set screw after adjusting the housing. Care must be taken in positioning the incoming wiring to ensure clearance between the wiring and the switch housing.
- Switch wiring should be brought through the conduit connection, under the baffle plate, wrapped around the sealing tube and brought up to the proper terminal. All excess wire should be cut off prior to stripping the wire to avoid interference with the action of the switch mechanism or housing cover.
- All housings must be properly "sealed" at the conduit connection to maintain the NEMA classification.
- Check the housing cover-to-base fit to ensure the gaskets are sealed properly.

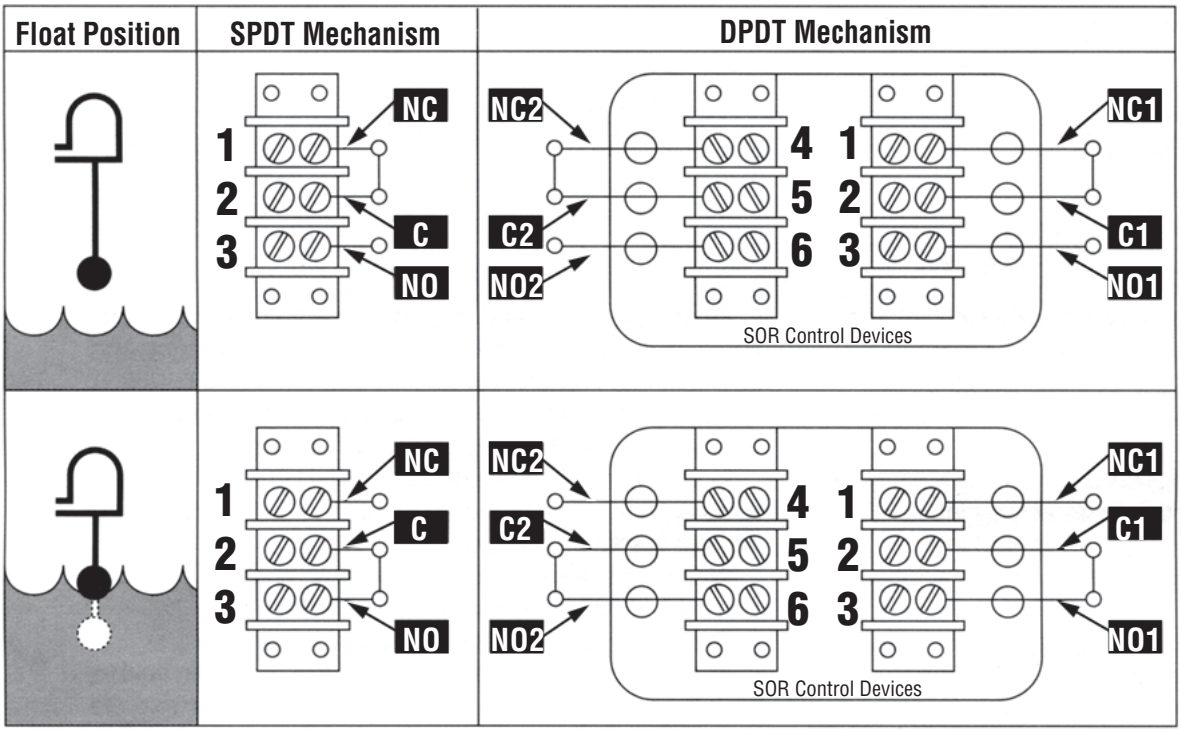
NOTE: For ATEX or IEC Certified T6 and S3 Enclosures: Electrical conduit connection threads may be of non-ISO thread form. Check the product certification nameplate for relevant thread form information before attempting to connect to the electrical conduit connection. In the event a fitting or adaptor is used, check the adaptor body for thread form information. The cable entry device shall be certified under explosion protection type "d" for flameproof enclosures, suitable for the conditions of use if correctly installed.

NOTE: For Product Utilizing a Hermetically Sealed Switch. If the unit is installed in a Class I, Div. 2 location, a conduit seal is not required per the National Electric Code (NEC) 501.5B.

NOTE: For Intrinsic Safety Certified T6 and S3 Enclosures, the parameters are as follows:
Ui = 30V Ii = 1A Ci = 0 Li = 0

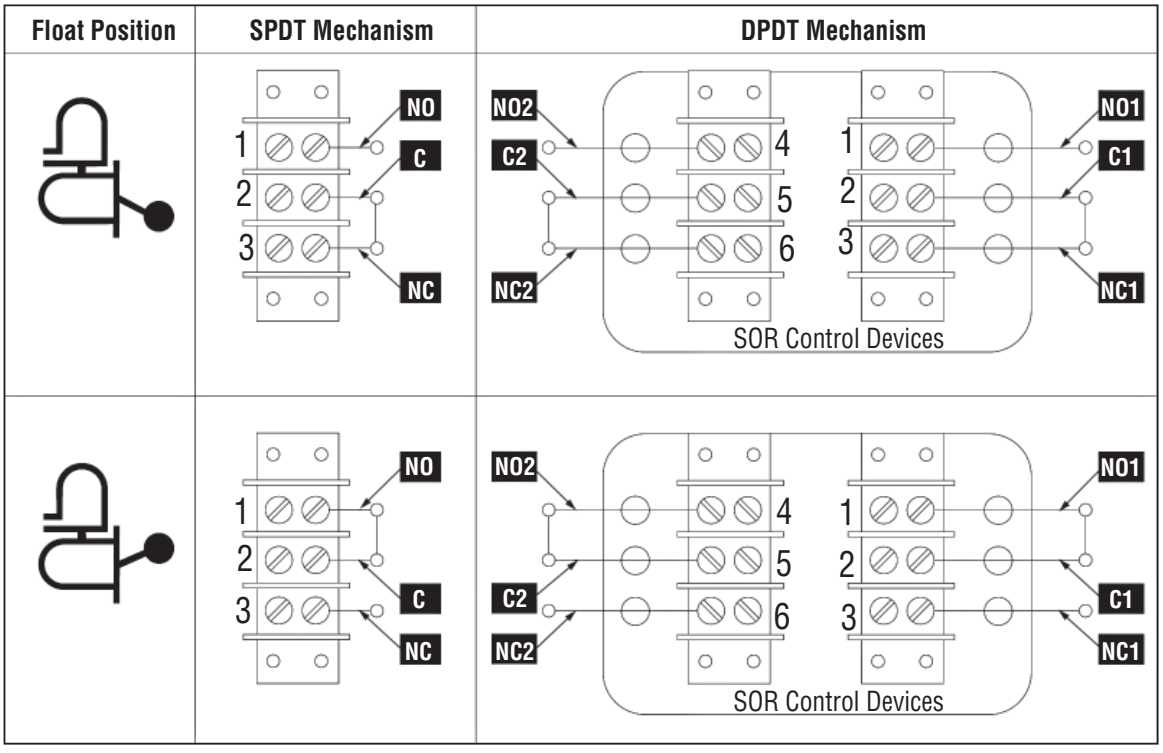
NOTE: See Specific Condition of Use on page 14 regarding the marking of nameplates for installation.

Safety Integrity Level (SIL) Installation Requirements



The SOR pressure switches have been evaluated as Type-A safety related hardware. To meet the necessary installation requirements for the SIL system, the following information must be utilized:

- Proof Test Interval shall be one year.
- Units may only be installed for use in Low Demand Mode.
- Products have a HFT (Hardware Fault Tolerance) of 0, and were evaluated in a 1oo1 (one out of one) configuration.



Form 1538 (03.12) ©2012 SOR Inc.

Wiring Mechanism

Vertical

Horizontal

NOTE: For C, G, R, S & Y Switch Assemblies, customer is to wire to the outside terminals.

Set Point

Rising level set point is the level at which actuation occurs. Falling level set point is the level at which deactuation occurs. Do not adjust the switch mechanism or the attraction sleeve position without factory instruction.

- **Float Type –** Set points are factory set (non-adjustable).
- **Displacer Type except for Top Mount –** Set points are factory set (non-adjustable).
- **Top Mount Displacer Type –** Set points may be adjusted by moving displacers up or down on the suspension cable.

Multi-stage controls are factory set for a specific switching sequence. Each control is tagged with a diagram showing the switching sequence.

Differential

Differential is the difference in liquid level between the actuation and deactuation points of a switching element.

- **Float Type –** Differential is factory-set (non-adjustable).
- **Displacer Type except for Top Mount –** Differential is factory-set (non-adjustable).
- **Top Mount Narrow Differential Displacer Type –** Differential is factory-set (non-adjustable).
- **Top Mount Wide Differential Displacer Type –** Differential may be adjusted by moving displacers up or down on the suspension cable. Set points are factory adjusted for the centerline of each displacer.

Do not change factory-set switching element positions during installation.

Pneumatic Piping

Pneumatic switches may be piped according to the charts below so that an air signal (outlet) is generated at either a high- or low-level condition.

	Liquid Level Condition	Output	Required Porting		
			Inlet	Output	Exhaust
Vertical	Low	Pressurized	B	C	A
	Low	Vented	A	C	B
	High	Pressurized	A	C	B
	High	Vented	B	C	A
	Liquid Level Condition	**Output**	**Required Porting**		
			Inlet	**Output**	**Exhaust**
Horizontal	High	Pressurized	B	C	A
	High	Vented	A	C	B
	Low	Pressurized	A	C	B
	Low	Vented	B	C	A

Standard Pneumatic 316SS Fittings		Non-bleed 3-way aluminum valve body. Buna-N O-Rings 150 psig maximum supply, 24 CFM @ 100 psig									

NOTE: Pneumatic switches must be used with clean, dry air or gas. All switches include a pre-wired terminal block. These switches have higher current ratings for SPDT than DPDT.

Preventive Maintenance

Periodic inspections are necessary to keep the switch in good working order. SOR recommends a systematic program of preventive maintenance be implemented at the time of installation. The following precautions are important and will help keep your switch in top operating condition.

- Keep the switching mechanism clean. Never leave the cover off longer than absolutely necessary. There is no need to lubricate any part of the switch.
- Inspect switches and wiring monthly. Dry contact switches should be inspected for excessive wear and misalignment. Pneumatic switch connections and tubing should be inspected for cracks and air leakage. Repair or replace as required.

Form 425 (09.16) ©SOR Inc.

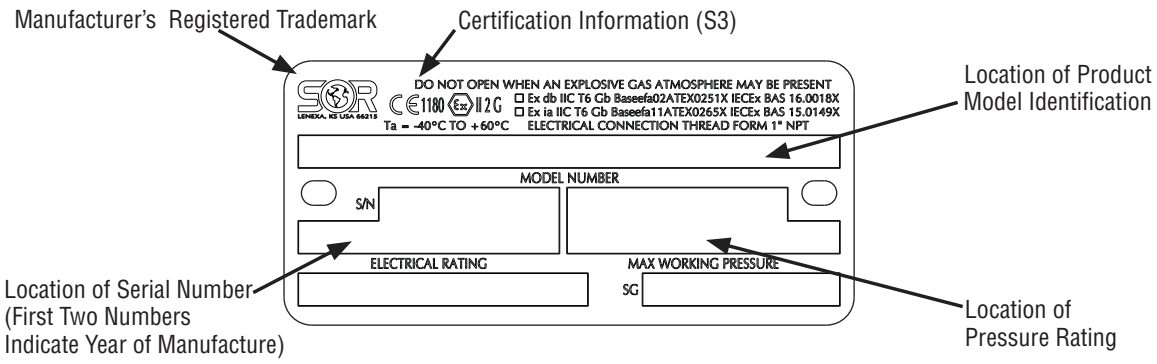
Troubleshooting

SOR switches are designed for long life and trouble-free operation. However, should you suspect a malfunction, conduct the following inspection.

Do not open when an explosive gas atmosphere may be present.

If required, this product must be installed with an explosion proof breather vent or drain per Agency requirements and the National Electric Code – Article 501, Section F, paragraph 3.

- Is the control being operated within the nameplate limitations?
- Is power connected to the control? Is the power "On"?
- Is the controlled equipment functional and wired properly? Is the level control wired properly? (See wiring continuity diagrams on Page 11 for proper wiring arrangement.)
- Is the control piped properly? The control must be piped so that it is within:
  a. - 3° of the horizontal centerline for horizontal mount units.
  b. - 3° of the vertical centerline for vertical mount units.
  c. Ensure that all process piping is free of foreign material and that isolation valves are fully open.
  d. Pneumatic lines must be free of liquid and foreign matter.
- Has the factory-set position of the switching element(s) changed?
- Is the control damaged? Inspect for cracks, terminal corrosion or lead wire damage. Replace the control if any damage is discovered.
- Does the control function when manually operated? Dry Contact Switches: Be certain the dry contact switch actuation lever is not bent, and the calibration set screw is positioned in the center of the lever. Manually move the magnet carriage. The carriage must not bind as it is moved. This manual movement of the carriage should cause switch actuation.
- * Make sure that the interior of the switch is free of dirt, corrosion and scale. Check the:
  a. Inside of the enclosing tube.
  b. Attraction sleeve and stem.
  c. Float or displacer.
  d. Interior of the chamber and process connections.
- * Ensure the factory-calibrated jam nut settings have not been moved and are carrying the attraction sleeve in and out of the magnetic field.
- Call the factory or the SOR representative in your area if inspection doesn't reveal the problem.



****NOTE: The enclosing tube gasket must be replaced each time the seal is broken. Standard gasket P/N 3070-015, spiral wound gasket P/N 3070-014 (for high pressure, high temperature and NACE units).***

Special Conditions for Safe Use

- This apparatus may have a combined nameplate which carries multiple approvals (Intrinsic Safety & Flameproof). The equipment should be marked as to which protection method it is installed as and shall not be changed or utilized in any other manner than was originally marked by the end user.
- To minimize the risk of electrostatic discharge, clean only with a damp cloth.
- The operating rod and bushing gap shall not exceed from 0.1 mm.

Service Policy

- In order to expedite the repair or replacement of returned goods, the following information must be provided:
  a Serial Number and complete Model Number.
  b. Customer Purchase Order Number.
  c. Installation site.
  d. Reason for return.
  e. A Material Safety Data Sheet must be provided.
- If the returned goods are defective as defined in the warranty, and returned within the warranty period, SOR will promptly repair or replace the returned goods at our option, without cost to the customer.
- If the returned goods are returned after the warranty period, or without a warranty claim, the customer must approve the repair or replacement.
- All shipments returned to the factory will be prepaid by the customer. All product warranty shipments shall be prepaid by the factory.

Limited Warranty

SOR® agrees to repair or replace any switch found to be defective in material or workmanship within five years from date of shipment. The warranty is valid only if the switch was installed in accordance with published factory installation instructions, operated within the design limitations stated on the nameplate, and returned to the factory for inspection, freight prepaid, within the warranty period. No claim for labor or consequential damages will be allowed.

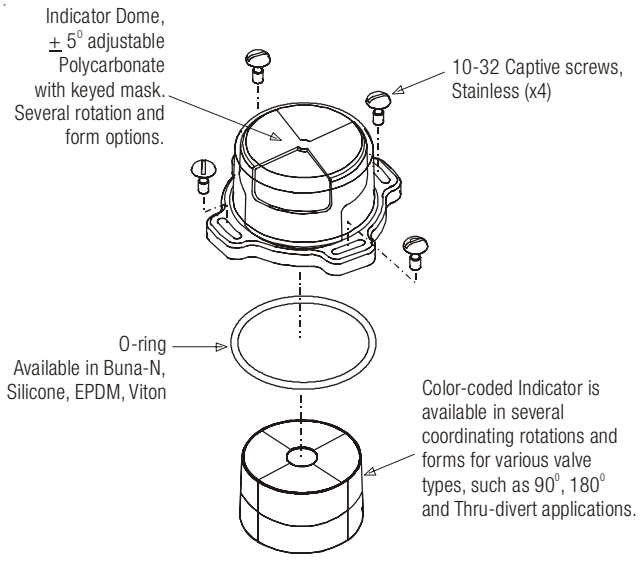
Installation Notes

1. Be cautious not to allow undue axial (thrust) load on the DXP shaft.

2. Cycle the valve a couple of times prior to final tightening of the mounting kit hardware. This allows the shaft to self-center in the pinion slot, or coupler.



3. Always use sound mechanical practices when torquing down any hardware or making pneumatic connections.

4. This product comes shipped with plastic plugs in the conduit entries in an effort to protect the internal components from debris during shipment and handling. **It is the responsibility of the receiving and/or installing personnel to provide appropriate permanent sealing devices to prevent the intrusion of debris, or moisture, when stored outdoors or when installed.**

5. **It is the responsibility of the installer, or end user, to install this product in accordance with the National Electrical Code (NFPA 70), or any other national or regional code defining proper practices.**

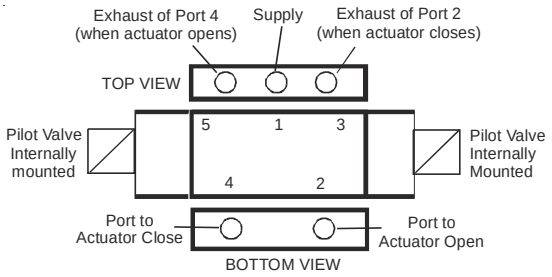
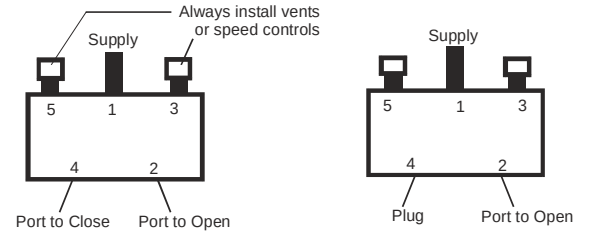
Enclosure Specifications / Materials of Construction	
Enclosure	Die-cast A360 aluminum with dichromate conversion coating inside and out & epoxy coated exterior
Fasteners	Qty 6: M8 socket head bolt - stainless steel (6mm wrench)
Shaft Bushings	Cast-in Oilite bronze
Seals	O-ring seals available in: Buna-N, Silicone, EPDM & Viton
Conduit Entries	Quantity 2-4 available in: 3/4 NPT, 1/2 NPT, M20 & M16
Mounting Holes	(4X) 5/16-18 UNC tapped holes on 2.25"(57.15mm) Square Pattern, Optional F05 Pattern



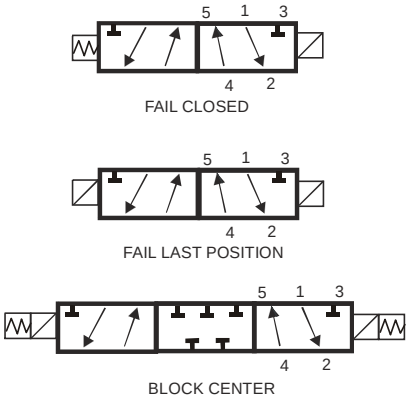
Maximum Torque Values for Fasteners		
Description	*Type*	*Max. Torque*
Enclosure Lid Screws	See spec Table	8 ft.lbs.
Indicator Dome Screws	10-32 UNF	20 in.oz.
Bottom Mounting Holes	5/16-18 UNF	10 ft.lbs.

Pneumatic Hookup Procedures



Prior to connecting the supply air to the spool valve, flush the system to remove any debris or contaminates. Galvanized pipe can easily flake and contaminate the system and therefore is not recommended.

4-Way Spool Valves



The TopWorx spool valve is a 5 port, 4-way valve driven by an internally mounted pilot valve. The spool valve supply port and work ports are 1/4" NPT. The exhaust ports are 1/8" NPT, marked as follows for the DXP:

NEVER PLUG, OR BLOCK, PORT 5

Spool Valve Specifications	
Medium	Dried, filtered air (40 micron)
Max Operating Pressure	100psi (0.7MPa) (6.89Bar)
Min Operating Pressure	30psi (0.28MPa) (2.76Bar)
Ambient Temperature Range	Refer to Product Nameplate Marking
Flow Coefficient	1.2Cv / 1.0Cv for Cold Temp
Environment Rating	Type 4, 4X, IP67
Port Size	1/4" NPT
Manual Override	Available in: Latching/non-latching Push Type & Palm Actuator Type
Valve Body	Available in: Hardcoat Anodized Aluminum, 304 & 316 Stainless
Valve Seals	Spool seals: Buna-N Valve Body Seals available in: Buna-N, Silicone, EPDM & Viton. Cold Temp Spools are lap-joint technology containing no seals.

Don't forget!

TopWorx has a complete line of breathers, flow controls, regulators and filters.

Check out **www.topworx.com** or call us at **502.969.8000** for more details

DID YOU KNOW? TopWorx manufactures the globally-known GO Switch Leverless Limit Switch, which comprises a full line of harsh environment sensors. If your application is very cold, very hot, under water or in a caustic atmosphere, then GO Switch has the answer.

Highly Recommended

TopWorx highly recommends Locktite 567 brand thread sealant. Do not use a hard setting pipe compound. If Teflon thread seal tape is used, start the wrap on the second thread from the leading thread of the fitting. This will prevent tape shreds from contaminating the spool valve seals.

Flow controls (AL-M21) or Breathers (AL-M31) should be installed in the exhaust ports to keep debris from falling into the spool valve and damaging the seals. This must be addressed prior to installation, or storage.

Switch Calibration Procedure

Never perform switch calibration procedure while area is known to be hazardous.

For Intrinsically Safe models, unit must be wired in accordance to Control Drawing S-K094/094A. Or, for standard explosion-proof models:
Calibration may be performed using a Volt-Ohm meter by using the Ohm setting across COM and NO. When switch is active, the meter will read ≤0.5 Ohms, or the Diode setting may used simply to indicate continuity.

If a 120Vac source is used, an appropriately sized resistor must be used in series to limit current to a maximum of 15 Amperes when circuit rating is unknown, or permanent damage may occur.

Step 1: With valve in the CLOSED position, disengage the BOTTOM Cam from the splined Hub and rotate Clockwise until SW1 activates. Release Cam to re-engage splined Hub.

Step 2: Rotate valve to the OPEN position. Disengage the TOP Cam from the splined Hub and rotate Counter-clockwise until SW2 activates. Release Cam to re-engage the splined Hub.

Step 3: Cycle valve CLOSED and OPEN several times to insure switches will maintain calibration.

For Reverse Acting actuators:

Step 1: With valve in the CLOSED position, disengage the TOP Cam from the splined Hub and rotate Counter-clockwise until SW2 activates. Release Cam to re-engage the splined Hub.

Step 2: Rotate valve to the OPEN position. Disengage the BOTTOM Cam from the splined Hub and rotate Clockwise until SW1 activates. Release Cam to re-engage the splined Hub.

Repeat Step 3 above.

Warranty

TopWorx warrants that each item of new equipment manufactured by it will be free from defects in material and workmanship under normal use and service; its obligation under this Warranty, being limited to making good, at its factory, and part of parts thereof, which shall be returned to it with transportation charges prepaid, within one year after the date of the purchase of such equipment by the original purchaser, and which its examination shall disclose to its satisfaction to have been thus defective. TopWorx however, assumes no risk or liability for results of the use of the products purchased from it.

THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER OF MERCHANTABILITY FITNESS, OR OTHERWISE EXPRESSED OR IMPLIED, AND ALL OTHER OBLIGATIONS OR LIABILITIES AND TOPWORX NEITHER ASSUMES , NOR AUTHORIZES ANY PERSON TO ASSUME FOR IT ANY OTHER LIABILITY IN CONNECTION WITH THE SALE OF THIS EQUIPMENT.

No claims for labor in replacing defective parts and equipment and consequential damages will be allowed by the Company.

This Warranty shall not apply to equipment which has been subjected to misuse, negligence or accident.

This Warranty shall not apply to any equipment which shall have been repaired or altered, outside the Company's factory so as to affect such equipment's stability or reliability in the judgement of the Company.

About Valvetop™

Valvetop valve networking and control devices link on/off valves to process control systems via a variety of fieldbus protocols. Valvetop valve controllers and monitors support multiple bus protocols, operate in the most demanding plant conditions, and carry a variety of global approvals. Whether your application is rotary or linear, fieldbus or conventional, hazardous or general purpose, we have a suitable solution for you.

For inquiries, contact TopWorx at: 502.969.8000
www.topworx.com
info@topworx.com

About TopWorx

TopWorx is the leader in field networking, valve control, and position sensing solutions for the process industries. Our products and services help plants, mills, and pipelines improve their performance by making it easy to implement modern automation technologies.

Field Networking Solutions

Networx™ field networking products and services make it easy for plant personnel to understand, implement, and enjoy the benefits of modern bus networking technologies.

Valve Control Solutions

Valvetop™ valve networking and control solutions support multiple bus protocols, operate in the most demanding plant conditions, and carry a variety of global approvals.

Position Sensing Solutions

GO® Switch leverless limit switches provide reliable position sensing in extremely hot, cold, wet, dirty, corrosive, abusive, and explosive plant conditions.

THE COMMITMENT CONTINUES

Fluid Power is our business. It is our only business, so we have to be good at it. Since its beginning in 1949, Versa has maintained its commitment to quality products and satisfied customers.

Versa has succeeded in serving industry's needs with a broad line of directional control devices. Our focus on product variety, technical expertise and company support remains constant. It all begins with a responsiveness to industry needs and ends with delivery of the valve or system you need–when you need it.

We view ourselves as problem solvers and that role requires more than making good products. It is what we do before and after that is equally important From drawing board to user satisfaction, our commitment is continuous.

QUALITY IS ABSOLUTE

Quality has no degrees at Versa. There is no such thing as "pretty good" or "almost right". Every product is designed and manufactured to conform to uniformly high standards.

These standards are assured by a quality management system which includes ISO 9001 certification and testing of all products prior to shipment.

No matter how tough the application or environmental demands, Versa offers you a choice of valves to meet the challenge. Advanced design, durable construction materials and rigid manufacturing standards provide valves you can rely on for years of trouble-free performance.

Be it a single valve or a pneumatic system, Versa's commitment to quality is uncompromising. Count on it.

WORLDWIDE ACCESSIBILITY

More than 500 fluid power representatives and over 100 stocking locations comprise Versa's worldwide distribution system. They are supported by manufacturing and technical centers in the United States and The Netherlands.

The distributor network is the key to customer service and the source of continuous application feedback. Versa uses this input as part of its research and development program in an effort to respond to individual and industry needs.

Versa makes certain that our distributors' sales and service personnel receive factory training on an ongoing basis. This includes basic theory, product indoctrination and seminars.

Our distributor family is a source of pride to Versa–but more important—it is a source of support and service to all of our customers.

Contact Versa for the distributor servicing your specific area.

HOW WE PUT IT TOGETHER IS WHAT SETS US APART

Versa is not the biggest manufacturer of directional control valves, so we try to be the best.

Design, manufacture, quality control, pricing, delivery – whatever the function – it must be geared to customer needs.

Many companies sell valves. At Versa, that is not enough. We sell satisfaction.

Versa exercises diligence to assure that information contained in this catalog is correct, but does not accept responsibility for any errors or omissions. Versa also reserves the right to change or delete data or products at any time without prior notification. To be sure the data you require is correct, consult factory.

DIRECT MOUNT ACTUATOR VALVES

ALUMINUM CONSTRUCTION

SERIES C5 NAMUR

3-Way/4-Way Field Convertible Solenoid Valves

General Description

The Versa C5 NAMUR mount control valve is a high flow, 5-port, solenoid/pilot valve. It is designed to mount directly to any NAMUR actuator, thus reducing actuator response time and cost of tubing, fittings, brackets, and labor.

The 5-port design allows the C5 NAMUR to be ordered as either 4-way (for double acting actuators) or 3-way (for spring return or fail-safe actuators). The function of this valve is field convertible utilizing no special tools, gaskets, or sealants. Relocation of a port plug converts a 3-way to a 4-way, or a 4-way to a 3-way. When the 4-way valve is converted to 3-way function, the unused exhaust port becomes an actuator vent into which a filter/muffler can be installed to prevent contaminants from entering either the valve or the actuator.

Single solenoid models (for 2-position control), or double solenoid models (for 2 or 3-position control) are available. Actuator positioning is possible with the use of 3-position valves since all Versa C5 NAMUR valves are bubbletight. A complete selection of electrical connections, area classifications, and power requirements makes the most exacting and demanding specifications or applications easy to satisfy. Manual overrides (guarded-push to operate) are standard on all C5 NAMUR valves. Consult factory for other manual overrides available as an option.

Materials

Valve Body and Plunger: anodized aluminum (for stainless steel direct mount valve, See page 8)
Actuating Caps: solenoid – anodized aluminum
spring cap – synthetic resin
Valve Seals: plunger and body – FKM (fluorocarbon)
pilot piston – NBR (nitrile)
valve/actuator mounting O rings – NBR (nitrile)
Pilot Piston: synthetic resin
Screws: stainless steel (except valve to actuator = carbon steel)
Port Plug: brass
Solenoid Parts: sleeve, plunger & spring – 304 & 430F stainless steel
coils–epoxy encapsulated with 3 spade terminals (std) or 2 or 3 wire lead (opt)
coil cover– (when applicable) option: –C50 = carbon steel, painted;
–LB–XN, –LB–XX,–PC, –PC–XN, –PC–XX, –XN, –XX= carbon steel, electroless nickel plated

Operating Pressures and Weights

Valve Type	Operating Pressure Range†† Pneumatic	Approximate Weights	
		Ordinary Service	Hazardous Service
Single Solenoid/Spring Return (2-position)	15-115 psi (1-8 bar)	0.8 lbs. (363 g)	1.1 lbs. (500 g)
Double Solenoid/Detented (2-position)	10-115 psi (0.7-8 bar)	1.2 lbs. (545 g)	1.8 lbs. (816 g)
Double Solenoid/Spring Centered (3-position)	15-115 psi (1-8 bar)	1.2 lbs. (545 g)	1.8 lbs. (816 g)

†† Pressure ranges may change based on solenoid option. See page 6.
MPa = $\frac{\text{bar}}{10}$
For higher pressure applications, consult factory.

Porting Size

Inlet and exhaust – 1/4 NPT or G1/4
Cylinder ports – O ring seal per NAMUR standard

Flow Rates

Cv = 0.75 (Kv = 11) average for all ports (48 SCFM at 100 psi; 82 $Nm^3/_h$ at 7 bar).
For actuator speed rates see page 6.

Installation, Filtration and Lubrication

Valves have no limitations on mounting orientation.
40 to 50 micron filtration and general purpose lubricating oil ISO, ASTM viscosity grade 32 recommended.
Ambient temperature range 5°F (15°C) to 125°F (50°C).

Options Suffix

Manual Override: none Standard on basic valves, guarded-push to operate.
For other solenoid options see page 6.

C5 NAMUR Valve

* All valves include O ring interface seals and #10-24 mounting screws.
For #10-32 screws change NB1 to NB2. For M5 screws change NB1 to NB3.
** 3-way is the same valve as 4-way, but is provided with a relocated cylinder port plug. See note on page 7

For coil code see page 6.
†Add suffix option here, if required.

SERIES E5 NAMUR
3-Way Solenoid Valves

General Description

The Versa E5 NAMUR mount control valve is an inexpensive, simple and effective 3-way direct-acting solenoid valve. It is designed to mount directly to any actuator with NAMUR footprint thus reducing cost of tubing, fittings, brackets and labor.

It is most effective on spring return or fail-safe actuators where high speed open or close is not important, but where cost is a factor. A threaded actuator vent port is standard.

Available as a 3-way, 2-position, direct solenoid, spring return only, and with most of the Versa solenoid options. See page 6.

Materials

Valve Body: anodized aluminum
Valve Seals: body/plunger –NBR (nitrile)
valve/actuator mounting O rings –NBR (nitrile)

Screws: (valve to actuator) = stainless steel)

Solenoid Parts: sleeve, plunger & spring – 304 & 430F stainless steel
coils–epoxy encapsulated with 3 spade terminals (std) or 2 or 3 wire lead (opt)
coil cover– (when applicable) option:–C50 = carbon steel, painted;
–LB–XN, –LB–XX, –PC, –PC–XN, –PC–XX, –XN, –XX= carbon steel, electroless nickel plated

Operating Pressures and Weights

Valve Type	Operating Pressure Range Pneumatic	Approximate Weights	
		Ordinary Service	Hazardous Service
Single Solenoid/Spring Return (2-position)	0-150 psi (0-10.3 bar)	0.6 lbs (272 g)	0.9 lbs (408 g)

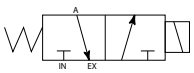
Porting Size

Inlet and Vent: 1/4 NPT or G1/4
Exhaust: #10-32 (1/8 NPT or G1/8 available)
Cylinder ports: O ring seal for NAMUR standard
(For non-NAMUR actuators, consult fatory)

Flow Rates

Cv = 0.08 (Kv = 1.2) average for all ports
(5 SCFM at 100 psi; 8.5 Nm3/h at 7 bar).
For actuator speed rates see page 6.

Options



See page 6.

Installation, Filtration and Lubrication

Valves have no limitations on mounting orientation.
40 to 50 micron filtration and general purpose lubricating oil
ISO, ASTM viscosity grade 32 recommended.
Ambient temperature range 5°F (15°C) to 125°F (50°C).

* Add option number to basic valve number as suffix

** Add coil code # to end of valve number

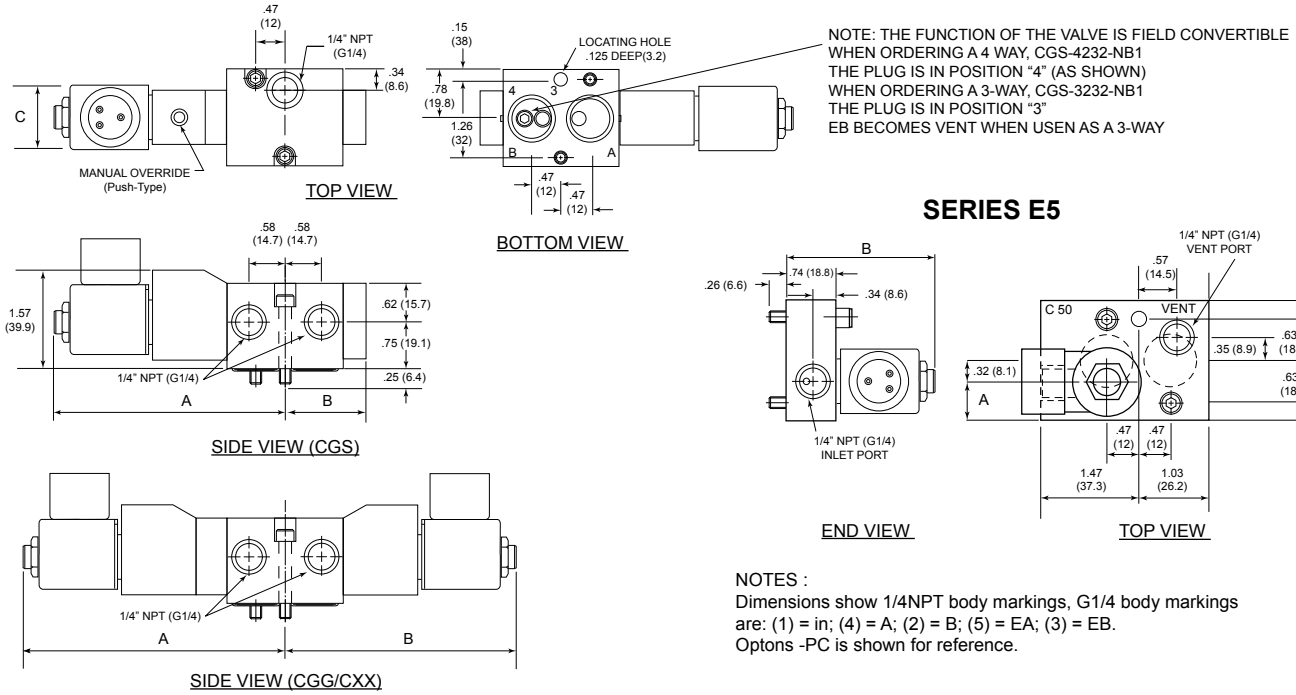
* Add option number to basic valve number as suffix.
See pages 26/27, 28/29 and 31 for complete description.

** The coil code is shown within the parenthesis following the voltage. Add desired coil code to end of valve number

NAMUR Actuator Speed Chart

This chart represents approximate actuator operation times under average load conditions at 80 psi (5.5 bar). Due to differing designs of quarter-turn actuators, breakaway friction, loading, internal airflow, inlet piping, fittings and exhaust port options, the values shown are intended as an estimate. Faster or slower times may actually be achieved.

		Actuator Volume in^3 (cm^3)									
	Valve Type	5 (82)	10 (164)	25 (410)	50 (820)	100 (1640)	150 (2460)	200 (3280)	400 (6560)	600 (9840)	1000 (16400)
ACTUATOR CYCLE TIME IN SECONDS	C5	.32	.36	.47	.63	.98	1.3	1.7	3.1	4.5	7.2
	E5	.46	.64	1.1	2.0	3.9	5.7	7.5	-	-	-
	C316	.19	.21	.25	.35	.55	.65	1.0	1.5	2.2	3.5



For double-acting actuators (open & close), use volume from selected actuator specifications and the chart for estimated speed. The times indicated are per shift. For spring return actuators, use open volume to obtain time from chart. Actuator spring loading may affect shift time. Slower speeds (adjustable) can always be accomplished by using Versa's Bleed Control Valves in the control valve exhaust port.

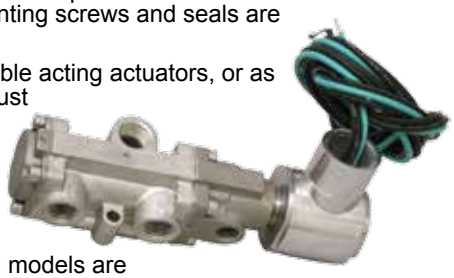
DIRECT MOUNT ACTUATOR VALVES



STAINLESS STEEL CONSTRUCTION

SERIES C316 NAMUR

Stainless Steel 3 or 4-Way Solenoid Valves

General Description

The Versa C316 Series stainless steel NAMUR mount actuator control valve is a high flow, bubbletight, 5 port solenoid valve. It is designed to mount directly to any NAMUR actuator, thus reducing actuator response time and space. Installed costs are also lower as the need for tubing, fittings, brackets and assembly labor are greatly reduced. All mounting screws and seals are included with the valve.

The 5-port design allows the C316 NAMUR valve to be ordered as either a 4-way for double acting actuators, or as a 3-way for spring return actuators. When the 3-way function is utilized, the unused exhaust port becomes an actuator vent where a filter/muffler can be installed to prevent contaminants from entering either the valve or the actuator. The 5-port design allows the user to independently control actuator speed in either open or close direction by utilizing speed or bleed controls. Single or double solenoid 2-position models are available. Single solenoid spring return models utilize an air assisted spring return feature, assuring a positive return. Double solenoid valves may be used in applications where a momentary signal is required or in a “fail in last shifted position” actuator application. Double solenoid models are equipped with a detent that maintains the valve in the last shifted position, even in high vibration applications. All solenoid actuators are solenoid/pilot type, which allows the use of smaller solenoids resulting in lower power consumption. This design assures a positive shift when the valve is energized and reduces the chance of coil burnout. Manual override for single or double solenoid valves is available as an option.

Materials

Valve Body, Actuating Caps & Internal Parts: 316L stainless steel
Valve Seals: FKM (fluorocarbon)
Screws: stainless steel
Solenoid Parts: 304, 430F & 302 stainless steel internal parts; coil/solenoid housing per solenoid option selected

Operating Pressure and Weights

Valve Type	*Operating Pressure Range Pneumatic	Approximate Weights		
		General Service	Hazardous Service	
			(-XX, -XN, -XIS_)	(-XMA_, -XIF_)
Single Solenoid-Spring Return	25 to 150 psi (1.8 to 10.3 bar)	1.3 lbs (590 gms)	1.6 lbs (725 gms)	2.5 lbs (1130 gms)
Double Solenoid	15 to 150 psi (1 to 10.3 bar)	1.9 lbs (860 gms)	2.6 lbs (1180 gms)	4.3 lbs (1950 gms)

* For applications above 125 psi (8.6 bar) exhaust flow controls or mufflers are recommended.

Porting Size

Inlet and Exhaust: 1/4 NPT
Cylinder Ports: O ring mount per NAMUR standard

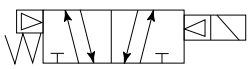
Flow Rate

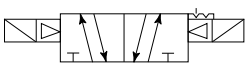
Cv = 1.6 (Kv = 23.5)

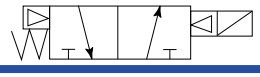
Actuator Speed

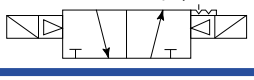
See chart on page 6 for approximate operation times under load conditions at 80 psi (5.5 bar).

Installation, Filtration and Lubrication









Valves have no limitation on mounting orientation.
40 to 50 micron filtration is recommended
Lubrication not required.
Ambient and media temperature range -5°F to 200°F (-20° to 93°C)
Low Temperature available consult factory.

BODYPORTED VALVES

ALUMINUM CONSTRUCTION

SERIES C5/C7 Bodyported
3-Way*/4-Way Solenoid Valves

General Description

Versa C5 and C7 valves are 5 port/2-position or 5 port/3-position, high flow, bodyported, solenoid/pilot valves. They can be provided with single or double solenoid actuators. Manual override (guarded-push to operate, turn to lock) is standard on all models. Other options are available. Actuator positioning is possible with the use of 3-position valves since all C5 and C7 valves are leak free/bubbletight.

The standard valve is supplied with DIN style coil, but other options are available making the most exacting and demanding specifications or applications easy to satisfy.

Materials

Valve Body and Plunger: anodized aluminum
Actuating Caps: solenoid – anodized aluminum
spring cap – synthetic resin
Pilot Piston: synthetic resin
Valve Seals: plunger and body – FKM (fluorocarbon)
pilot piston – NBR (nitrile)
Screws: Stainless steel
Solenoid Parts: sleeve, plunger & spring – 304 & 430F stainless steel
coils epoxy molded with 3 spade terminals (std) or 2 or 3 wire leads (opt)
coil cover (opt.-when applicable) zinc chromate plated steel

Valve Type	Size Series	Operating Pressure Range† Pneumatic	Approximate Weights	
			Ordinary Service	Hazardous Service
Single Solenoid/spring return (2-position)	C5	15-115 psi (1-8 bar)	0.5 lbs. (235 g)	0.8 lbs. (363 g)
	C7	25-115 psi (1.7-8 bar)	0.7 lbs. (300 g)	1.0 lbs. (454 g)
Double Solenoid/detented (2-position)	C5	10-115 psi (0.7-8 bar)	0.87 lbs. (395 g)	1.2 lbs. (545 g)
	C7	15-115 psi (1-8 bar)	1.0 lbs. (454 g)	1.3 lbs. (590 g)
Double Solenoid/spring centered (3-position)	C5	15-115 psi (1-8 bar)	0.87 lbs. (395 g)	1.2 lbs. (545 g)
	C7	25-115 psi (1.7-8 bar)	1.0 lbs. (454 g)	1.3 lbs. (590 g)

† Pressure ranges may change based on solenoid option. See page 6.

MPa = $\frac{\text{bar}}{10}$

For higher pressure applications, consult factory.

Porting Size

Inlet, outlet and exhaust – 1/8 NPT or G1/8-Series C5
1/4 NPT or G1/4-Series C7

Flow Rates (average for all ports)

Cv = 0.75 (Kv = 11) for 1/8 NPT (G1/8)-Series C5
Cv = 1.6 (Kv = 23) for 1/4 NPT (G1/4)-Series C7

Installation, Filtration and Lubrication

Valves have no limitations on mounting orientation.
40 to 50 micron filtration and general purpose lubricating oil ISO, ASTM viscosity grade 32 recommended.
Ambient temperature range 5°F (15°C) to 125°F (50°C).

Options Suffix

Manual Override: none Standard on basic valves, guarded-push to operate, turn to lock -
-CML unguarded-push to operate, twist to lock

For solenoid options see page 6 (same options utilized as Direct Mount Valves).

SERIES V Bodyported

3-Way & 4-Way Solenoid Valves

General Description

Versa Series V valves are full flow valves, available in 1/8, 1/4, 3/8, 1/2, 3/4 and 1" NPT port sizes. Ports of 1/8 to 1/2 ISO 228 "G" threads are also available. Three-way designs are provided with 3 ports; four-way designs have 5 ports. Each is available for 2-position or 3-position service. Standard size O ring seals provide bubbletight sealing and ease of service.

Each valve is solenoid/pilot actuated, which enables the use of physically small solenoids providing low power consumption, and also assures a strong positive shifting force without fear of coil burn-out. A complete selection of electrical connections, area classifications, and power requirements makes the most exacting and demanding specifications or applications easy to satisfy.

Materials

Valve body: forged brass
Actuating Caps: solenoid – forged brass
spring cap – diecast aluminum
Internal parts (wetted): rod brass
Valve seals: NBR (nitrile), standard size O rings
Screws: zinc plated steel
Solenoid parts: sleeve, plunger & spring – 304 & 430F and 302 stainless steel
coils epoxy molded with 2 or 3 wire leads (Std.)
coil cover (Std) – zinc chromate plated steel

3-WAY DIRECT SOLENOID VALVES

General Description

Two valve series, Series E and Series E5, comprise the direct actuated, 3 port/2 position valves. The main difference between the two series is physical size and weight, Series E being the greater of the two. Both series offer high reliability at low cost. Stainless steel construction provides the compatibility for use with many aggressive media and environments.

A variation of the valve type provides electrical quick exhaust valves. These valves function the same as a 3-way valve, but a larger capacity exhaust and rapid response to slight pressure differential during the de-energized portion of the cycle, results in a more rapid evacuation of the controlled device than would be expected with a standard 3-way valve.

Materials

Valve body, 430F stainless steel
Valve seals: Nitrile (Buna N)
Solenoid parts: sleeve, plunger & spring— 304, 430F and 302 stainless steel
coils—epoxy molded
coil cover (when applicable)—zinc chromate coated steel

Installation, Filtration and Lubrication

Valves have no limitations on mounting orientation.
40 to 50 micron filtration and general purpose lubricating oil ISO, ASTM viscosity grade 32 recommended.
Ambient temperature range 0°F (-18°C) to 180°F (82°C).

Series E5 Quick Exhaust

SERIES C316 Bodyported
3-Way & 4-Way Solenoid Valves

General Description

Versa Series C316 stainless steel valve is a high flow, 3 or 5 port solenoid valve that utilizes a fluorocarbon elastomer seal packed plunger that provides bubbletight performance with long, trouble-free product life. The design also provides the highest flow in the smallest package. Stainless steel bodies, actuating caps and internal parts allow use in the most aggressive environments.

The C316 Series is available as 4-Way, for double acting devices, or 3-Way for spring return devices. The 3-Way function can be specified as either normally open or normally closed. All solenoid actuators are solenoid/pilot type, which allows the use of small solenoids resulting in low power consumption. Solenoid/pilots also provide a positive shifting force that assures the valve shifts, thus reducing the chance of coil burnout. Single solenoid-spring return models utilize an air assisted return feature assuring a positive return. Double solenoid models are equipped with a detent that maintains the valve in the last shifted position, even in high vibration environments. A complete selection of electrical connections, power requirements and area classifications makes the Versa C316 the valve of choice for demanding applications.

A Latching Reset option for single solenoid-spring return 3-Way & 4-Way valves is available for the C316 Series. With the loss of solenoid signal or pressure, the valve shifts closed and latches. The valve cannot be re-shifted until manually reset.

Materials

Valve body, actuating caps & internal parts: 316L stainless steel
Valve seals: FKM (fluorocarbon)
Screws: stainless steel
Solenoid internal parts: 304, 430F & 302 stainless steel
Coil/solenoid housing: per solenoid option selected

Operating Pressures & Weights

Valve Type	Operating Pressure Range Pneumatic	General Service	Hazardous Service (-XX, -XN, -XIS)	Hazardous Service (-XMA, -XIF)

SERIES V316 Bodyported
3-Way and 4-Way Solenoid Valves

General Description

Versa Series V316 valves are available in 1/4", 3/8", or 1/2" and 1" NPT port sizes. Three-way designs are provided with 3 ports; four-way valve 5 ports. Each is available for 2-position or 3- position service.

Investment cast 316 stainless steel bodies and actuating caps, coupled with 316 stainless steel internals makes this valve series compatible for use with aggressive media and environments.

Each valve is solenoid/pilot actuated, which enables the use of physically small solenoids and resultant low power consumption, and also assures a large positive shifting force without fear of coil burnout. A complete selection of electrical connections, area classifications, and power requirements makes the most exacting and demanding specifications or applications easy to satisfy

Materials

Valve Body, actuating caps, internal parts: 316 stainless steel
Valve Seals: FKM (fluorocarbon)
Screws: stainless steel
Solenoid Parts: sleeve, plunger & spring – 304, 430F and 302 stainless steel
coils—epoxy molded
coil cover (when applicable) – electroless nickel plated steel

Porting Sizes

Inlet, outlet, & exhaust: 1/4" NPT, 3/8" NPT, 1/2" or 1" NPT

Flow Rates (average for all ports)

1/4" NPT: C_V = 1.8 (K_V = 26)
3/8" NPT: C_V = 2.0 (K_V = 29)
1/2" NPT: C_V = 5.5 (K_V = 80)
1" NPT: C_V = 11.1 (K_V = 161)

3-Way NC
Solenoid Operated/Spring Return
Lockout Valves

General Description

Versa 3-way normally closed Lockout Valves function the same as a solenoid operated-spring return valve, except that a means is provided to allow the valve to be physically locked with a padlock or hasp with padlock in order to prevent accidental actuation. Two types of lockout are available: one provides the ability for locking the valve in the de-energized position whereby the inlet is blocked and the exhaust is open; the other type provides the ability for locking in either the de-energized or energized position.

Types Available

	Series V	Series V316
Media:	Pneumatic Service	Pneumatic Service
Pressure: (minimum depends on valve size)	40 or 50 to 175 psi (2.8 or 3.5 - 12 bar)	40 to 175 psi (2.8 - 12 bar)
Construction Materials:	Forged & machined brass; NBR (nitrile) O ring seals	Investment cast & machined 316 stainless steel; FKM (fluorocarbon) seals
Functional Type:	3-way normally closed	3-way normally closed
Body Style:	Bodyported	Bodyported

** Valves with ISO 228 "G" threads are designated by utilizing Suffix "-2B" in model number

Options

Options available for Series V Lockout Valve are the same as listed on page 13.
Options available for Series V316 Lockout Valve are the same as listed on page 19.

Installation, Filtration and Lubrication

Valves have no limitations on mounting orientation.
40 to 50 micron filtration and general purpose lubricating oil ISO, ASTM viscosity grade 32 recommended.
Ambient temperature range -10°F (-23°C) to 200°F (95°C).

SPECIAL PURPOSE DUAL SOLENOID VALVES

BRASS OR **STAINLESS STEEL** **CONSTRUCTION**

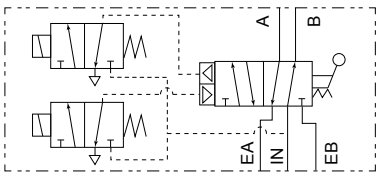
Push Pull Solenoid Suffix-PPG

General Description

A dual solenoid valve with a hand lever. The design concept is to provide the functionality of a, dual coil, 2-position valve with the addition of manual control or any other actuator. The valve operates as standard 2-position requiring only momentary electrical contact to shift valve. Various manual actuators are available. The lever shown is a -"L" type which can be manually set in either offset position when the solenoid valve is de-energized.

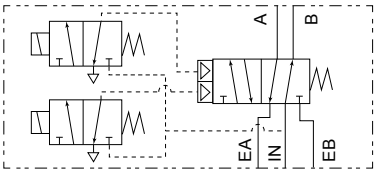
Redundant Solenoid 2oo2, Suffix -RS

General Description

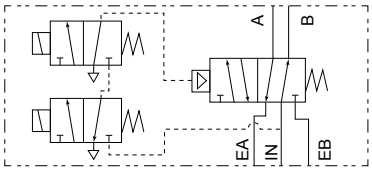


When parallel electronic control circuits are utilized in a system, if a complete control circuit fails or requires maintenance, the parallel circuit will keep the system running. In a parallel circuit Versa's Redundant Valve functions the same as a solenoid operated-spring return valve, except that it has two solenoids (one for each of the parallel circuits) rather than one solenoid. Either or both of these solenoids will shift and maintain the controlled device in the shifted position. Both solenoids must be de-energized to return the controlled device to the un-shifted position. The use of one Redundant Valve can replace multiple valves and components to accomplish the same function. This function can be considered as a (2oo2).

Shut off Valve 1oo2, Suffix -SOV



General Description



While the *Shut off Valve* looks similar to the *Redundant Solenoid Valve* (shown above) the internal pilot circuit is different. The -SOV option provides a series pilot control circuit that requires both coils, a primary and a secondary, to be energized in order for the valve to shift. Conversely if the electrical signal to either coil is removed the valve will return to the de-energized position. This function can be considered as a (1oo2). Where various control devices (e.g., temperature, pressure switches) could be wired in series with each coil. The actuation of any one of these devices, attached to either coil, would interrupt the signal to the coil and cause the valve to shift to the de-energized position.

LATCHING/MANUAL RESET VALVES

BRASS OR **STAINLESS STEEL** **CONSTRUCTION**

General Description

Latching valves are particularly suited to applications where it is desirable or mandatory to manually reset or restart a system. A typical application could involve the emergency shutdown of automatically monitored process operations. Loss or interruption of the control signal to the valve actuator causes the valve to shift, latch and shut-down a process step. When the signal is restored the valve remains in the latched position until the operator manually unlatches it and allows the process step to resume. Positive latching in such an application is vitally important since many process operations are sequential and one step must not be started until the one ahead of it has started.

This example is only one of many which can be accommodated through the use of Versa's Latching Valves. A wide range of functional types, port sizes, actuators, and latching arrangements provide the engineer with a complete choice of valving to suit his particular needs.

Types Available	Series V	Series V316
Media	Pneumatic; others, consult factory.	Pneumatic and various other gases, including corrosives.
Pressure: (minimum depends on size and type)	20 or 55 to 175 psi (1.4 or 3.8 to 12 bar)	20 or 55 to 175 psi (1.4 or 3.8 to 12 bar)

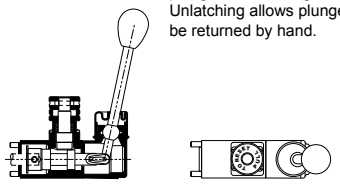
Actuation	Solenoid/pilot for either ordinary service or hazardous service.	Solenoid/pilot for either ordinary service or hazardous service.

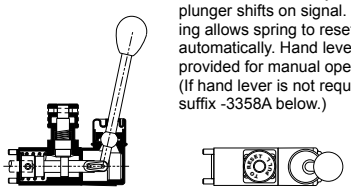
Latching/Reset Devices For Series V or V316 Valves



The Latching Device actuator consists of the latch, with or without an integral spring for returning the valve plunger, and an inline hand operator where needed to manually shift the valve.

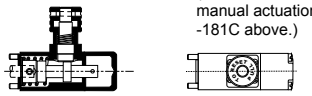
The specific Latching Device may be attached to any Series "V" valve body size or style up to 1" NPT or any Series V316 valve body up to 1/2" NPT, as indicated for the type of latching/reset device required. The actuator on the opposite end of the valve body would be a solenoid/pilot device.

LATCHES IN ACTUATED POSITION



Suffix "-181B"

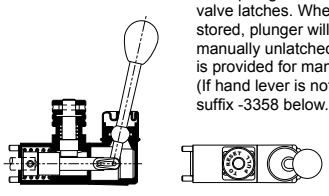
Latches automatically when plunger shifts on signal. Unlatching allows plunger to be returned by hand.



Suffix "-181C"

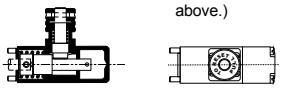
Latches automatically when plunger shifts on signal. Unlatching allows spring to reset plunger automatically. Hand lever provided for manual operation. (If hand lever is not required see suffix -3358A below.)

Suffix "-3358A"



Latches automatically when plunger shifts on signal. Unlatching allows spring to reset plunger automatically. (If hand lever is required for manual actuation see suffix -181C above.)

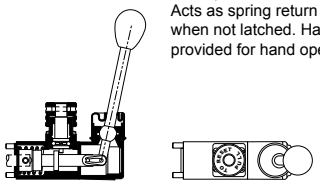
LATCHES IN UN-ACTUATED POSITION



Suffix "-181D"

Unlatching allows plunger to shift on signal. If signal is lost, spring shifts plunger automatically and valve latches. When signal is re-stored, plunger will not shift until manually unlatched. Hand lever is provided for manual operation. (If hand lever is not required see suffix -3358 below.)

Suffix "-3358"



Unlatching allows plunger to shift on signal. Spring returns plunger automatically and valve latches. (If hand lever is required for manual actuation see suffix -181D above.)

LATCHES IN EITHER POSITION

Suffix "-181AA"

(2 position latch) Valve may be manually latched in either offset position or left unlatched. Acts as spring return valve when not latched. Hand lever is provided for hand operation.

How to specify LATCHING/RESET VALVES

PRODUCT NUMBER COIL CODES: Complete product numbers require, when applicable, a coil code that represents the desired coil current, frequency and voltage. The coil code takes the form shown below, with ratings and voltage substituted as required.

Voltage (Power)	Electrical Characteristics	Miscellaneous
All usual 50 Hz & 60 Hz AC (7.3W) All usual DC (9.5W)	Class F epoxy molded coil (155ºC). Continuous duty, 2 leads 24" (60 cm).	Steel cover with 1/2 NPT conduit entry.
24V60, 120V60, 240V60 (8.5W) 24V50, 110V50, 220V50 (8.5W) 12VDC, 24VDC, 48VDC (10.5W)	Class F epoxy molded coil (155ºC), with 3 spade terminals and mini DIN socket with PG9 cable gland. Continuous duty.	

Voltage (Power)	Electrical Characteristics	Miscellaneous
All usual 50 Hz & 60 Hz AC (5.6W) All usual DC (7.2W)	Class F epoxy molded coil (155ºC). continuous duty. 3 leads 24" (60 cm).	Plated steel coil housing with 1/2 NPT conduit entry. For stainless steel (182FM) coil housing add: (-ST)
12V60, 24V60, 48V60, 120V60, 240V60 (1.8W) 6VDC, 12VDC, 24VDC, 48VDC (1.8W)		Plated steel coil housing with 1/2 NPT conduit entry. For stainless steel (182FM) coil housing add: (-ST) Maximum pilot pressure 120 psi (8 bar). 1.8W nominal power.
All usual 50 Hz & 60 Hz AC (5.6W) All usual DC (7.2W)		Plated steel coil housing with M20 x 1.5 conduit entry. Ground terminal on cover. For stainless steel (182FM) coil housing add: (-ST)
12V60, 24V60, 48V60, 120V60, 240V60 (1.8W) 6VDC, 12VDC, 24VDC, 48VDC (1.8W)		Steel chromate coated coil housing with M20 x 1.5 conduit entry. Ground terminal on cover. For stainless steel (182FM) coil housing add: (-ST) Maximum pilot pressure 120 psi (8 bar) 1.8W nominal power.
24VDC (D024) 120V60 (A120) 110V50 (E110) 230V50 (E230) 1.8 Watt standard, for lower watt contact factory.	Epoxy molded coils rated for continuous duty, Class H – 180°C.	Stainless steel coil housing with internal Junction Box. Internal and external ground screw.
24VDC (4W) (Consult factory for other voltage options)	Continuous duty coil & rectifier, including surge suppression, potted within housing.	Thick wall epoxy coil housing with integral junction box. Internal ground terminal. M20 x 1.5 conduit entry: (-XMAA), (-XMFA), Cable gland for 6-12 mm ø cable: (-XMAE), (-XMFE) 1/2 NPT conduit entry with adapter: (-XMAF), (-XMFF)
24VDC (10W inrush, 2.6W holding) (Consult factory for other voltages)	Continuous duty coil & power controller potted within housing.	
24VDC (0.8W) (Consult factory for other voltages)	Continuous duty Coil and power controller potted within housing.	Requires the use of an approved safety barrier or isolator. Thick wall epoxy coil housing and integral junction box. Internal ground terminal. M20 x 1.5 conduit entry: (-XIFA) Cable gland for 6-12 mm ø cable: (-XIFE) 1/2 NPT conduit entry with adapter: (-XIFF)
24VDC system voltage prior to barrier (1.6 watt max.)	Class F epoxy molded coil (155ºC). Continuous duty.	Requires the use of an approved barrier or isolator. Maximum operating system voltage before barrier 28VDC. Maximum pilot pressure 115 psi (8 bar). 3 spade terminals & DIN connector with PG9 cable gland: (-HC) 1/2 NPT conduit entry: (-HCC)

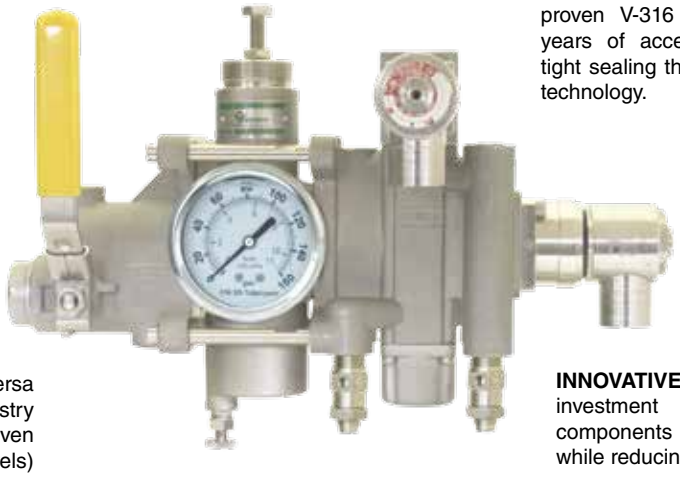
Modular Air Package

Based on the V316 Series

General Description

The Versa Modular Air Package is a compact air management system, based on V316 Series components, that will provide a full range of pneumatic accessories and functions to meet the needs of most control systems in the actuator control industry. Major components are shutoff and check valves, filter/regulators, speed controls and directional control valves.



Design Benefits

Versa's VMAP simplifies the design process by combining all the components of a common circuit into one integrated assembly. Whether a standard shutoff circuit or an intricate control system, VMAP has the features to meet the requirements of any control project. VMAP will reduce engineering, components, vendors, costs, weight and save time.

TROUBLE FREE. Designed with integral assembly flanges combined with all O ring interface sealing and standard fasteners. Long leak free service life is accomplished. No custom or flat gaskets to leak or brackets to fail.

EFFICIENCY. VMAP's modular design effectively groups common automation and controls components together in user approved groupings to combine features and reduce size and weight.

TECHNOLOGY. Utilizing the latest in computer aided design and finite element software flow is maximized yielding the highest flow in the smallest of packages.

PROVEN. VMAP is based on Versa's field proven V-316 Series product. Over 30 years of acceptance in providing bubble tight sealing though Versa's packed plunger technology.

CUSTOM CIRCUITRY is achieved through modular design by simply combining various components to create the desired circuit

FLEXIBILITY. Many standard and custom circuits are easily created using the VMAP modular concept.

RELIABILITY. The reliability of the Versa V-316 Series combined with industry approved materials yields a proven product. SIL (Safety Integral Levels) exceeding most application requirements.

INNOVATIVE. Through the use of investment casting technology main components are integrated saving space while reducing potential leakage points.

ENGINEERING BENEFITS

- Standard or custom circuits available utilizing VMAP's modular components.
- Convenience of one purchase order and one vender.
- No need for developing Bill or Materials for fittings, tubing and bracketing.
- No need for designing complete layout of many different system components.
- No need for designing brackets for many individual components.

FIELD BENEFITS

- Repairability ease; by removing a few screws and the various modules can be disassembled and inspected, no tubing or fittings to remove
- Field configurability of function after installation; add more valves as the requirements of the process change.
- 10 year warranty

INSTALLATION BENEFITS

- Reducing fittings, tubing and related labor costs
- Reduction in size and weight
- One component to mount.

See VMAP Bulletin online at Versa Website

WARNINGS REGARDING THE DESIGN APPLICATION, INSTALLATION AND SERVICE OF VERSA PRODUCTS

The warnings below must be read and reviewed before designing a system utilizing, installing, servicing, or removing a Versa product. Improper use, installation or servicing of a Versa product could create a hazard to personnel and property.

DESIGN APPLICATION WARNINGS

Versa products are intended for use where compressed air or industrial hydraulic fluids are present. For use with media other than specified or for non-industrial applications or other applications not within published specifications, consult Versa.

Versa products are not inherently dangerous. They are only a component of a larger system. The system in which a Versa product is used must include adequate safeguards to prevent injury or damage in the event of system or product failure, whether this failure be of switches, regulators, cylinders, valves or any other system component. System designers must provide adequate warnings for each system in which a Versa product is utilized. These warnings, including those set forth herein, should be provided by the designer to those who will come in contact with the system.

Where questions exist regarding the applicability of a Versa product to a given use, inquiries should be addressed directly to the manufacturer. Confirmation should be obtained directly from the manufacturer regarding any questioned application prior to proceeding.

INSTALLATION, OPERATION AND SERVICE WARNINGS

Do not install or service any Versa product on a system or machine without first depressurizing the system and turning off any air, fluid, or electricity to the system or machine. All applicable electrical, mechanical, and safety codes, as well as applicable governmental regulations and laws must be complied with when installing or servicing a Versa product.

Versa products should only be installed or serviced by qualified, knowledgeable personnel who understand how these specific products are to be installed and operated. The individual must be familiar with the particular specifications, including specifications for temperature, pressure, lubrication, environment and filtration for the Versa product which is being installed or serviced. Specifications may be obtained upon request directly from Versa. If damages should occur to a Versa product, do not operate the system containing the Versa product. Consult Versa for technical information.

LIMITED WARRANTY DISCLAIMER AND
LIMITATION OF REMEDIES

Products sold by Versa are warranted to be free from defective material and workmanship for a period of ten years from the date of manufacture, provided said items are used in accordance with Versa specifications. Versa's liability pursuant to that warranty is limited to the replacement of the Versa product proved to be defective provided the allegedly defective product is returned to Versa or its authorized distributor.

Versa provides no other warranties, expressed or implied, except as stated above. There are no implied warranties of merchantability or fitness for a particular purpose. Versa's liability for breach of warranty as herein stated is the only and exclusive remedy and in no event shall Versa be responsible or liable for incidental or consequential damages.

The procedures included in this book are to be performed in conjunction with the requirements and recommendations outlined in API Specifications. Any repairs to the equipment covered by this book should be done by an authorized Cameron service representative. Cameron will not be responsible for loss or expense resulting from any failure of equipment or any damage to any property or death or injury to any person resulting in whole or in part from repairs performed by other than authorized Cameron personnel. Such unauthorized repairs shall also serve to terminate any contractual or other warranty, if any, on the equipment and may also result in equipment no longer meeting applicable requirements.

File copies of this manual are maintained. Revisions and/or additions will be made as deemed necessary by Cameron. The drawings in this book are not drawn to scale, but the dimensions shown are accurate.

SCOPE

370D6 ball valves 2” FP to 16” FP are full bore, through conduit, bi-directional, anti-blowout stem, double block and bleed in closed and open position, with trunnion mounted ball for easy operation. These valves can be equipped with plastic seat inserts made of RTFE, NYLON, or PEEK as the customer requires. All the seats are self-relieve type seats to eliminate cavity pressure lock. All valves have a built-in sealant injection system for emergency seat seal and also a stem sealant fitting for stem seal recovery. The valve uses backed self-lubricating PTFE sleeve bearings and thrust washers for low torque operation.

The 370D6 valves are available in the sizes and classes as per Table 3.

Unless otherwise specified on the purchase order, all the small sizes of valves are equipped with a wrench head (noted W in Table 3) as standard; all other valves are equipped with a gear operator (noted G in Table 3). The hand wheel can be removed from the gear shaft by taking out the roll pin.

Table 3 – 370D6 Series Ball Valve Availability

Valve Availability						
Valve Class/Size	150	300	600	900	1500	2500
2FP	W	W	W	W	W	W
3RP			W	W		
3FP	W	W	W	W	W	W
4RP			W	W		
4FP	W	W	W	W	G	G
6RP	W	W	W	W	G	G
6FP	W	W	G	G	G	
8RP	W	W	G	G	G	
8FP	G	G	G	G	G	
10RP	G	G	G	G	G	
10FP	G	G	G	G		
12RP	G	G	G	G		
12FP	G	G	G			
14FP	G	G	G			
16FP	G	G	G			

All valves are built with trim selection and seals as the customer requires. Contact a WKM representative for proper trim selection for the required application.

NAMEPLATE INFORMATION

The valve information, including trim, is clearly identified on the valve nameplate that is permanently affixed on the valve. Figure 3 shows a standard valve nameplate and Table 4 details the information stamped on the nameplate.

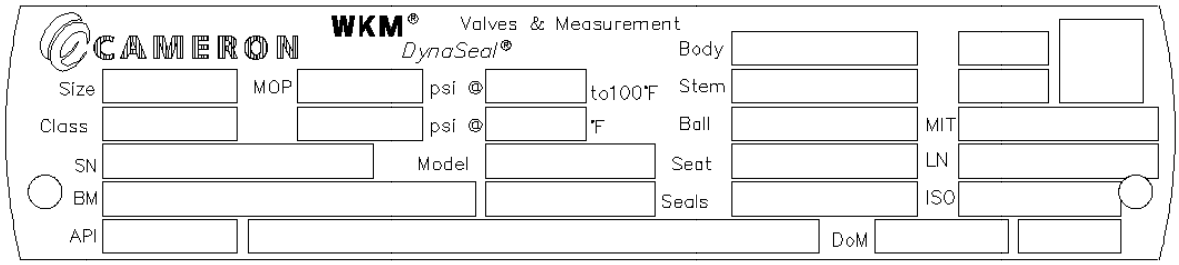

Figure 3 – 370D6 Ball Valve Standard Nameplate

Table 4 – Nameplate Information

Item	Preprint	Stamp
1	Size	If full bore, size is the nominal bore size If reduced bore, size is end size x bore through ball x end size
2	Class	Valve Class Designation as defined per API 6D
3	SN*	Valve's unique Serial Number
4	BM	Valve Bill of Material part number
5	MOP	Maximum Operating Pressure; the working pressure of the valve @ 100°F and at maximum temperature

STORAGE

VALVES DELIVERED BY WKM

Following testing and prior to shipment, valves are drained of water and through bores and flange faces are coated with grease and covered by protectors. This will protect the valves for a minimum of six months in covered storage from the date of shipment. For long periods of storage and particularly harsh environments (i.e. as found in an uncovered marine atmosphere) additional precautions must be taken.

All 370D6 valves should be stored in the full open position as received, with the flange seal surfaces and the bore greased, and the protectors installed on the flanges. If long term storage is necessary, the valve should be conditioned according to standard engineering practices; contact a WKM representative for long term storage procedures.

INSTALLATION AND OPERATION INSTRUCTIONS

BEFORE INSTALLATION SAFTEY INFORMATION

Valves shall be operated and maintained strictly in accordance with these procedures. Operation or maintenance outside of these procedures constitutes abuse of the product and voids all warranty and claims.

When special operation is required, a formal written request to the company must be made for approval to operate in this manner if warranty and product liability is to be maintained.

Before any work is performed on a valve, personnel working on the valve must obtain the proper work permits required by his employer. Personnel shall always use safety precautions set forth by the law and regulations required by his employer. Personnel shall also be aware that any venting or draining of fluids from the valve shall be done in accordance with safety and environmental procedures enforced at the particular location.

The maintenance personnel doing the repairs shall be well trained and familiar with all of the information contained in this manual.

The valves shall be appropriately used for the intended purpose. Any safety or protection devices on the valve shall not be permanently removed or altered unless written approval is received from a WKM representative.

Transport, unpacking, lifting, and connections to the different types of systems (electric, pneumatic, hydraulic systems, etc.) shall be made by expert and qualified personnel.

Should any difficulties or abnormalities arise that cannot be solved by the technician, contact a WKM representative.

Any servicing not covered by these instructions must be made by an authorized service center, after preliminary approval has been given by a WKM representative.

INSTALLATION

Before installation, ensure the grease fittings and sealing surfaces of connection flanges were not damaged during transportation. Clearly identify the valve through its nameplate, check its weight with the packing list or relevant documents, and then place it on a horizontal surface using suitable handling equipment.

Handling equipment must be provided which is appropriate for the total weight of the package. Pay particular attention that slings do not damage the gear or actuator.

For 370D6 valves 8FP to 16FP use the lifting lugs or eyes on the valve for slinging. Do not use lifting lugs or eyes provided on the gear or actuator, if present.

To avoid the ingress of debris or sand into the ball and seat area, the protective covers should not be removed until the valve is ready to be installed in the line. When the valve is ready to be installed in the line, remove the protective plastic or wooden flange protectors.

During installation the valve must be fully open and the line sections, between which the valve will be installed, must be aligned, cleaned, and correctly spaced. Should the valve be closed, the exposed face of the ball must be protected with grease or other anti-adhesive product.

When the valve has butt welding ends, welding on the line must be performed using the proper welding procedure. After welding, clean and check the weld bead and repair as required.

WKM 370D6 valves are bidirectional and may be installed with either end facing upstream. The valve should be installed in such a way as to facilitate maintenance, easy access to the valve fittings, and actuating operations.

370D6 valve standard position is with the stem in the vertical, upwards position and gear/wrench on the top side of valve. In this position the drain/bleed fittings are located in the lowest part of the body which allows for the most effective drainage. However, the valve may be installed in any position as far as stem location, but the drain fitting will not be in the lowest part of body and the drainage may not be as effective.

CAUTION: If the valve cannot be properly drained (see Section 6.1) and the line's foreign particles removed, the seats may wear out, get damaged, or accumulate particles and water that may prevent easy operation and affect the valve performance. It is the responsibility of the user to determine if the application may include abrasive particles and the valve may be need to be installed in a different position than the standard stem-upwards position.

When installing the valve, allow for possible deformations caused by the expansion of the line. The valve must not support the line. Avoid any strain in the valve body.

CAUTION: Do not overload the valve beyond the design piping loads stated on the requirements.

Use studs, nuts, and raised face gaskets or ring joints as per size and class conforming to ASME B16.5. Alternately tighten the studs using a cross pattern method, several times, following the procedure recommended by ASME PCC-1-2010 "Guidelines for Pressure Boundary Bolted Flange Joint Assembly" or gasket manufacturer specification.

CAUTION: While all 370D6 trunnion ball valves have self-relieving seats as standard equipment, it is recommended that appropriate safeguards be put into place to prevent exceeding the pressure/temperature limits given by the manufacturer.

FIELD TESTING

When field testing is required, the following procedures are recommended:

1. Ensure that the test fluids are compatible with the valve seat and seal material
2. Flush the system to remove foreign material that may be in the line as a result from installation procedures to avoid damaging the ball and seats
3. If performing line shell testing, the valve shall be in half open position. The maximum line pressure can be 1-1/2 times the valve maximum cold working pressure
4. If performing seat testing, make sure the valve is fully closed. The maximum pressure for seat testing is the maximum cold working pressure
5. After completion of testing, purge all test fluids from the valve

CAUTION: If the seats are tested to a higher pressure than the maximum cold working pressure, the seats can be permanently damaged. If a higher test pressure is desired contact a WKM representative for details.

OPERATION

370D6 series ball valves only work in the fully closed or fully open position; these valves work for on/off service only.

WARNING: These valves shall never be operated partially open or partially closed. Throttling (partial opening) or "pinching" flow may cause non-uniform wear on seats and ball over the sealing surfaces where it is exposed to the flow line, preventing tight shut-off.

To close the valve, turn gear hand wheel clockwise until it stops; to open the valve turn the gear hand wheel counter-clockwise until it stops.

All the wrench operated valves have the wrench levers aligned along with valve through bore when opened and perpendicular with the through bore when closed.

All gear operated valves have the gear indicator aligned with the valve through bore when opened and perpendicular with the through bore when closed. The gear also has "OPEN" and "CLOSE" markings.

While opening or closing, the ball must reseat; this reseating torque is higher than the run torque. Turn the hand wheel until the gear has a positive stop.

If the valve is operated by a power actuator, carefully read the actuator operation manual.

CAUTION: The end stops have been shop set to assure the correct 90 degree rotation from the fully open to fully closed position. Do not change their adjustment. If the valve is not correctly reseated at the end of opening or closing, the ball and the seats can quickly be damaged when exposed to flow pressure, preventing tight shut-off.

These valves can be operated by one person. It is recommended that no extensions be used for operating the valve. Using an extension or power tool to operate the valve voids all warranty and claims, and may result in failure.

MAINTENANCE PROCEDURES

Under normal working conditions, 370D6 ball valves are designed for lengthy, reliable service. The following recommended practices and procedures will ensure optimum performance.

DRAINAGE PROCEDURE

All valves can be drained and lubricated depending on application conditions, or anytime if desired. Valves may accumulate water, scale, deposits, and other foreign matter during their service. These materials may damage the valve in the following ways:

1. At low temperature, ice may form inside the valve and hinder its normal operation
2. Foreign matter may prevent the valve from fully closing and the ensuing throttling may damage the ball or the seat seals
3. Foreign matter may get caught between the ball and the seat and damage their surfaces

A drainage schedule is the best way to prevent damage caused by foreign matter. However, it is recommended that drainage should be carried out in the following cases:

1. Whenever the valve does not close
2. Before and during the cold season
3. After washing the line
4. After hydraulic test
5. Periodically to remove the accumulation of body debris. The frequency may be established based on the contaminants in the application

For a drainage procedure, the following procedure is recommended:

1. 370D6 valves are double block and bleed in closed and also open position. The drainage can be done in either the closed or open position. Make sure the valve is fully closed or fully open.

   NOTE: The time to drain the valve depends on the size of the valve and the fluid in the line; significant time may be required if the line contains a gas fluid. If the valve is drained in the open position, the time will be shorter compared to if drained in the valve in the closed position due to the smaller body cavity to drain when the valve is fully open.

2. Slowly open the bleed fitting (171) located on the lower side of the body.

CAUTION: Open the drain fitting slowly until the pressure in the body cavity has been discharged. Make sure the fitting body does not unscrew while loosening the fitting stem. If necessary, use another wrench to prevent the fitting body from unscrewing.

LUBRICATION – GREASE INJECTION

The implementation of a regular lubrication program extends the service life of the valve before carrying out maintenance operations and improves its performance. It is recommended to schedule a regular lubrication program based on the frequency of operations and the severity of service. All 370D6 series ball valves have two grease injection fittings located on the body seat area with the exception of the 2", 3", and 4" Class 150 & 300 that have one grease fitting located in the center of the body.

Lubrication also may be necessary for a temporary seal restoration in the event of slight damage to the seats caused by debris in the line; before operating the valve if the valve has been left in its position for a long period of time; or as soon as an increase in stem torque is noticed.

CAUTION: Grease fittings should not be removed if there is pressure in the line. Grease fittings should never be painted.

The gear operators are factory lubricated for life. If desired, the gear can be lubricated using the lube fitting located on the side of the gear operator.

WKM 103 is an effective sealant; it is viscous grease with a thick consistency. It consists of synthetic oils, a suspending agent, friction-reducing filler, plastic, and an antioxidant. WKM 103 Sealant may be used in valves with a temperature range of -50° F through 250° F. This sealant is suitable in lines transporting hydrocarbon liquids and gases where water, dilute acids, alkalis, or salt solutions may be present; as well as where sweet or sour produced gas with water or organic condensate, LPG, and aqueous solutions are being transported. The gallon containers are for use with bucket-type high-pressure grease guns. Gun cartridges are poly bags sized to fit screw/prime high pressure handguns.

WKM 103 Sealant part numbers:

- K155812 Gun Cartridge
- K155849 1 gal – 10 lbs.
- K155853 3 gal – 30 lbs.
- K155857 5 gal – 50 lbs.
- K155866 16 gal – 150 lbs.
- K155869 55 gal – 551 lbs.

WKM Lubricant 58G part number – K154208 – Gun Cartridge

For Lubrication and temporary seat or stem seal restoration with the valve under line pressure, follow the instructions below:

1. Fill the WKM high pressure grease gun with valve sealant

2. Make sure the valve is in the fully open or fully closed position. For 2", 3", and 4" Class 150 & 300 valves, lubrication is recommended in the fully open position

Warning: Back up the seat grease fitting so only the safety vent cap will be removed from the fitting. Carefully remove the safety cap from the seat grease fitting. NEVER remove the grease fitting when the valve is under pressure.

3. Remove safety vent cap from grease fitting. Attach grease gun connection onto grease fitting and inject sealant. If injection of the sealant is difficult, flush the valve seats and attempt to inject sealant again.

4. Repeat process for the second seat grease fitting as applicable, or the stem fitting. Replace safety caps on all grease fittings.

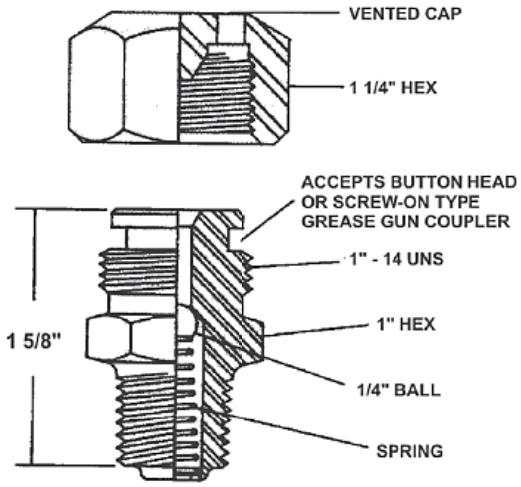

Figure 4 – Typical Injection Fitting

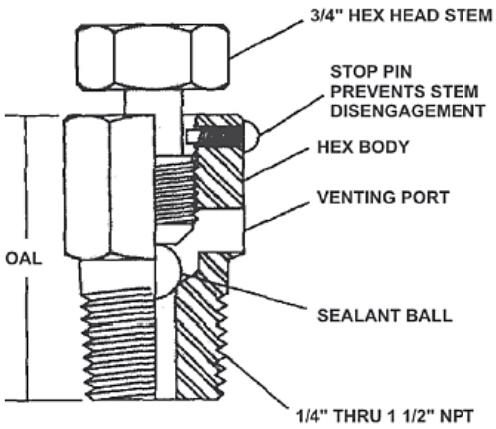

Figure 5 – Vent or Bleed Fitting

Table 5 shows a list of recommended lubricants by the cleaner/sealant manufacturer for the indicated service and conditions. Use of other lubricants without WKM approval voids all warranty and claims. Contact WKM representatives for availability.

Table 5 – Manufacturer Recommended Lubricants

370D6 VALVE RECONDITIONING

The 370D6 valves can be rebuilt if necessary. The disassembly and reassembly of the valve requires proper lifting equipment and normal maintenance tools.

Spare parts are determined by the individual customer specification; however the following list is suggested as a minimum for typical maintenance operations:

- Stem and ball radial bearings
- Stem thrust washers and ball thrust washer (if applicable)
- All O-rings and applicable back-up rings
- Seat springs
- Seat subassemblies
- Drain fitting
- Grease injection fittings

CAUTION: Prior to disassembly, the valve must first be isolated from system pressure and flow. Operate the valve at least two times and drain the valve to make sure there is no residual pressure left in the body.

After observing the above precautions, remove the valve from the pipe line system. Set the valve in a clean place free of dust and/or metallic chips.

DISASSEMBLY

1. Operate the Valve to the closed position.

CAUTION: Prior to disassembly, verify that there is no pressure in the body cavity. Operate the valve at least two times to bleed any residual pressure.

2. Stand the valve on the body flange end. Care should be taken to avoid damaging the sealing surface of the raised face or ring groove (if applicable).
3. If wrench operated – remove the wrench screw on top of the stem, the washer, and the wrench.
4. If actuated valve – check the actuator operation manual and remove the actuator.
5. If gear operated – loosen the gear mounting hardware while lifting the gear until it comes off of the stem.

6. Remove stem key. Unscrew the adapter plate or lever plate cap screws and remove the adapter plate paying attention not to damage the torque pins.
7. Unscrew the stem grease fitting and the plug (if applicable), unscrew the stem retainer screw(s) and remove it.

CAUTION: Failure to remove the stem retainer screw (one or two as applicable) will prevent the stem removal from the body and may cause severe stem and screw damage during the following step.

8. Carefully pull the stem out of the body. To remove the stem, install a cap screw through the gear plate into the threaded hole located on the top of the stem. Use a rubber mallet to hit against the gear plate and gently pull the stem out. Remove the O-rings, back-up rings, and stem thrust washer and use a screwdriver to also remove the stem bearings.
9. Remove the cap screw from the stem, and again utilize the gear plate to remove the trunnion from the body.
10. Remove the lower cover plate O-ring and back-up ring (if applicable). Carefully remove the ground spring located between the trunnion and ball.
11. Loosen and remove the body nuts.
12. Lift the tailpiece off of the body paying attention not to damage the body O-ring.
13. Remove the tailpiece O-ring and back-up ring if applicable.
14. Using a strap, lift the ball out of the body and lower it onto wood blocks. Take out the drive pins and inspect the trunnion bearing and thrust bearing (if applicable). Remove bearings as necessary.
15. Remove the seat ring from the tailpiece, taking care not to damage the seals.
16. Remove the O-rings and the back-up ring from the seat assembly.
17. Remove the seat spring from the tailpiece pocket.
18. Repeat steps 15-17 for removal of the body seat assembly.
19. Remove the drain fitting and grease fittings.

CLEANING

CHEMICAL RESISTANT VINYL OR RUBBER GLOVES SHOULD BE WORN DURING CLEANING OPERATIONS

- Remove any foreign and corrosive products within the body.

CAUTION: Abrasive cleaning products should never be used, especially on sealing area. If water jetting is used, dry with compressed air.

- Clean all metallic parts with a soft cloth saturated with a solvent. Observe all sealing surfaces.
- Clean the grease fittings and, if present, the grease channels.

Clean the sealing rings and the gaskets with a soft cloth. If necessary, wash them with soap and rinse them with clean water.

INSPECTION

After cleaning, all valve components should be inspected for damage, dents, scoring, wear, or corrosion. If any damage is found, proceed with the repair where possible or with replacement of the parts.

For a complete inspection procedure, the following operations should be carried out:

1. Check the metallic parts for damage along the sealing surfaces and on moving surfaces. Particular attention should be paid to surface nicks and corner damage.

2. Make sure that the sealing rings and gaskets are not slashed, extruded and/or otherwise damaged.

3. Check for scratches and plating defects on the surfaces of the bearings, the thrust washers, the O-ring grooves, the ball, and the seat components.

4. Inspect all replacement components that are going to be used to ensure damage has not occurred in storage or transportation.

5. If any damage is found, the minor repairs should be carried out by trained personnel, otherwise contact WKM representative.

The minor repairs that may be carried out on site by maintenance personnel shall be in accordance with the following points:

1. Use standard engineering practices to repair the damaged metallic surfaces.

2. Remove surface nicks on ball and stem by using a mild abrasive such as Scotch Brite pads.

3. Remove all corner damages by using a mild abrasive or with a bearing scraper.

4. Replace all faulty parts and components.

5. Flush lube and sealant while the valve is disassembled.

REASSEMBLY

After inspecting the parts and getting the replacement parts as required, use the following procedure to assemble the 370D6 ball valve:

1. Place the body, on the ANSI flange, on a clean and solid surface that will hold the weight of the assembled valve securely. Place the tailpiece on the ANSI flange. Take care not to damage the sealing surfaces.

2. If studs have been removed, install the studs in the body with the ID stamping up and the short end threaded into the body and screw them down completely. Remove any particles which may have flaked off the studs.

3. Inspect the seats, paying careful attention to the insert sealing surfaces. Reject and replace all seats with dings, scratches, or any other physical defects. Install the O-rings and the backup ring. The back-up ring should be on the head side of the seat as shown in Fig. 10. Apply lubricant until completely covering the O-rings and back-up ring.

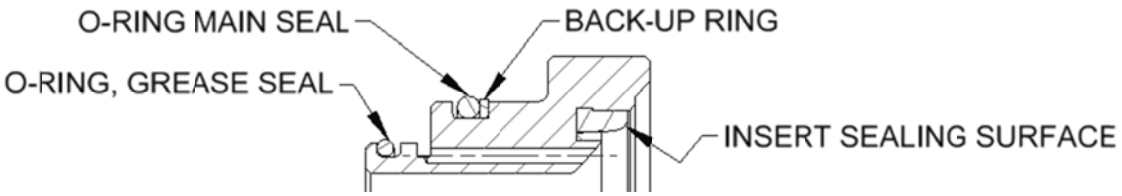

Figure 10 – 370D6 Seat Assembly

4. Install the O-rings and back-up ring (as applicable) to the tailpiece and cover. If the valve size and class require back-up rings, those shall be positions above the O-ring towards the flange of the part as shown in detail J and detail K of Fig. 1 and Fig. 2.

5. Install the radial bearings on the stem using a bearing tool shown in Fig. 11. The lower bearing is wider than the upper bearing. Both bearings shall fit into the designated grooves.

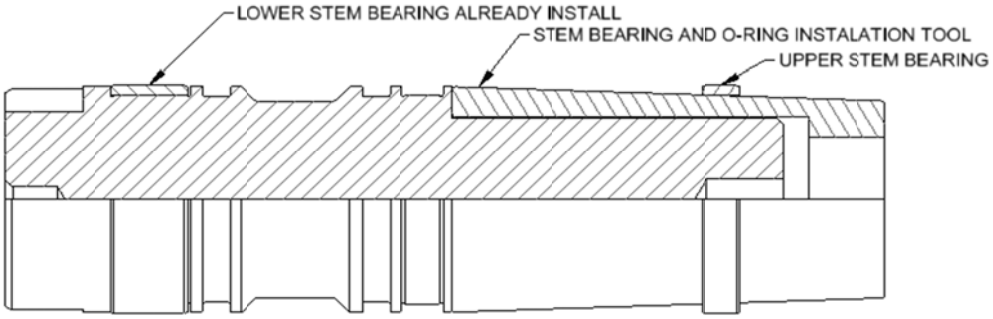

Figure 11 – Stem Bearing Installation

Using the same tool, install the O-rings. Install the back-up rings above the O-rings on the stem gear side, as shown in Fig. 12.

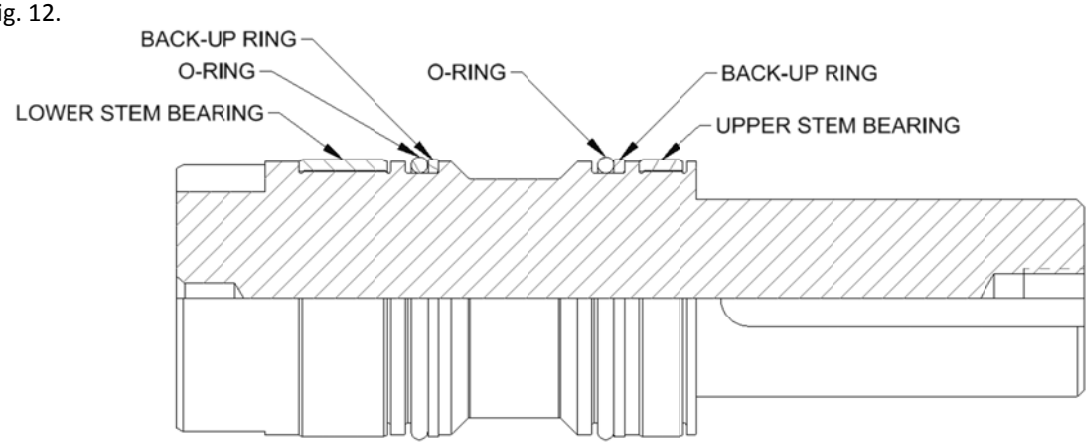

Figure 12 – Stem O-ring Installation

6. Install the ball thrust washer (if applicable) and the trunnion radial bearing in the ball trunnion bore.

7. Grease the ball drive pin holes and install the drive pins. Make sure the drive pins are placed correctly in the holes and do not stick above the ball.

8. Apply a coat of lubricant on the entire surface of body and tailpiece seat pockets and install the seat springs into the seat pockets.

9. Lower one seat assembly, with the insert facing up, into the body pocket. Press the seat using a proper tool until the O-rings and back-up rings are completely engaged in the pocket. Take care to avoid damaging the seat insert.

10. Repeat the procedure with the other seat into the tailpiece seat pocket.

11. Lift the ball and slightly lower into the body until it rests on the body seat, then orient the ball trunnion hole with the body trunnion hole. The ball should be in the closed position and symmetrically oriented over the body seat. There should be an equal amount of the body seat visible on both sides of the ball.

12. Grease the body trunnion hole and stem hole.

13. Set the ground spring on top of the trunnion with a generous amount of grease, and push the trunnion into the body bore hole until the trunnion engages the ball. Use a rubber mallet if necessary. Install the lower cover plate over the trunnion and thread at least two cap screws until the cover plate back face contacts the body trunnion boss face.

14. Flip the tailpiece over using the proper lifting equipment. Lift the tailpiece and start lowering it onto the body. Before the tailpiece engages the studs, orient it such that the grease fittings of the tailpiece are on the same side as the grease fittings of the body, towards the front of the valve or aligned with the stem bore (if applicable). At the same time, the tailpiece end flange bolt holes must be aligned with the body end flange bolt holes. After these two alignments are completed, slowly lower the tailpiece onto the body until it rests on the ball.

15. Install two nuts, 180°apart, and tighten sequentially until the tailpiece is contacting the body around the entire flange. Install the remainder of the nuts.

16. The stem should be installed at this time.

NOTE: The ball was installed in the closed position and the drive pins should be aligned with the valve bore. Check to make sure the drive pins are in the correct place on the ball holes. Orient the stem (as shown in Fig. 13) with the key groove toward the valve body markings and the drive pin holes matching the drive pins in the ball. Orient the bearing splits towards the stem key groove and drive the stem into the body using a rubber mallet until the stem completely engages the ball and drive pins.

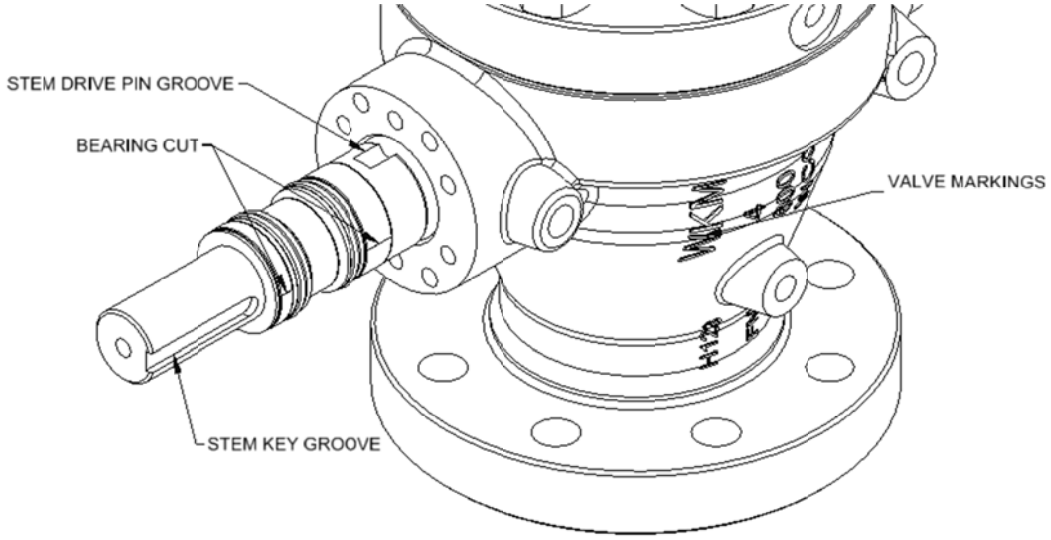

Figure 13 – Stem Orientation for Installation

17. If a wrench operated valve, use the following procedure to install the wrench (as detailed in Fig. 14):
    a. Install the stem thrust washer over the stem with the Teflon backing oriented towards the ball.
    b. Install the locating pin into the correctly sized hole.
    c. Install the lever plate over the stem. The lever plate should fit over the locating pin with the key grooves oriented towards the valve body markings and the tailpiece.
    d. Install all cap screws and torque as required per Table 7.
    e. Install the key. The key should not stick above the stem.
    f. Install the weather protector.
    g. Install the wrench head and secure the washer and screw on top of the stem.

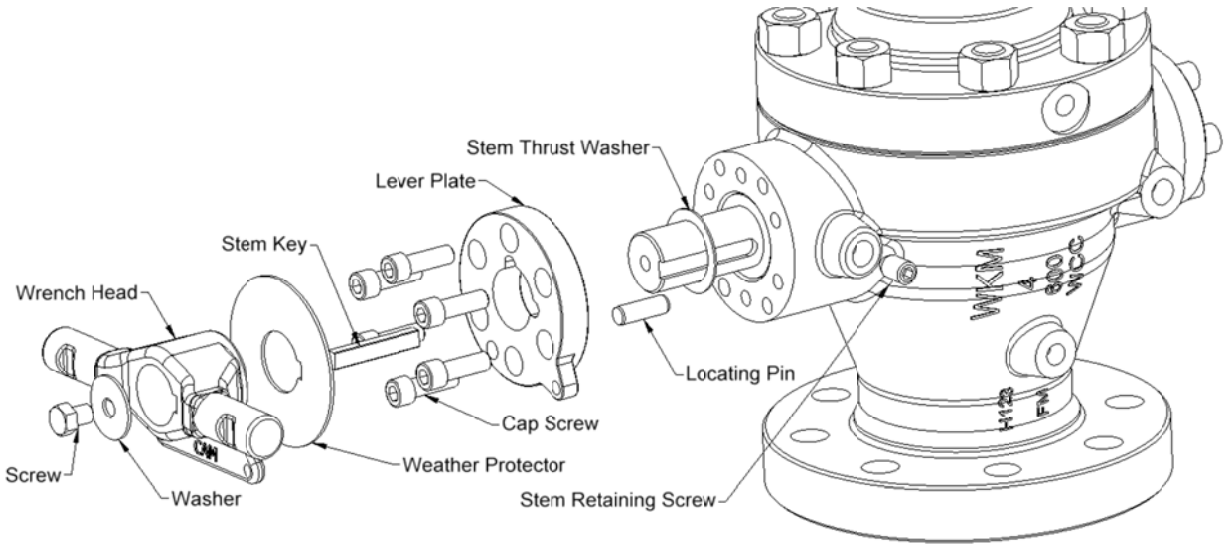

Figure 14 – Wrench Operated Valve Assembly

18. If a bare stem valve, use the following procedure to install the adapter plate (as detailed in Fig. 15):
    h. Install the stem thrust washer over the stem with the Teflon backing oriented towards the ball.

i. Install the torque pins and the locating pin into the correctly sized holes.
j. Install the gear adapter plate over the stem. The plate should fit over all the pins including the locating pin, with the key grooves oriented towards the valve body markings and the tailpiece.
k. Install all the cap screws and torque as required per Table 7.
l. Install the key. The key should not stick above the stem.

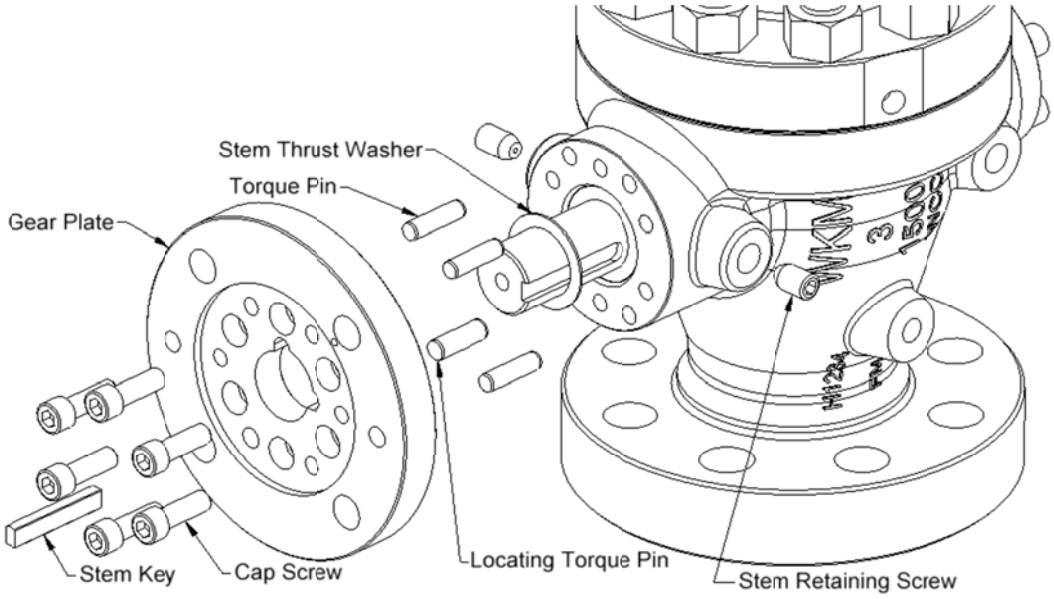

Figure 15 – Gear Adapter Plate Assembly

19. Install the stem retaining screw(s). Thread the screws until contacting the stem and turn back a half turn.

CAUTION: If the stem retaining screw is not backed off and remains in contact with the stem, the valve torque may increase and affect actuator performance.

20. If removed, tape all check valves and external fittings with Teflon tape and install them at this time. Use the installation torques noted in Table 8.

21. The body stud nuts and cap screws should be torqued as required per Table 7, in a cross pattern sequence. Check each at least twice to make sure they have been tightened correctly.

22. If the valve requires a gear operator, see Gear Operator Assembly. If otherwise actuated, carefully read the actuator operation manual before installation.

GEAR OPERATOR ASSEMBLY

Contact a WKM Representative for part numbers and other relevant information to select the proper gear operator. The gear can be installed in two positions, with the gear shaft on either side of the valve so the valve can be operated from either side of the pipeline. However, unless otherwise specified by the customer, the gear is installed with the gear shaft on the front of the valve (valve body markings) and the procedure below shows the steps for this installation (detailed in Fig. 16).

1. With the gear positioned with the indicator cap down, install the mounting studs provided with the order.

2. Before sliding the gear completely against the adapter plate, check the position of the hand wheel gear shaft. On all 370D6 series valves the shaft will be oriented to the top right. The shaft will always be at 90° from the centerline of the valve and never at an angle.

3. After correctly positioning the hand wheel gear shaft, slide the gear operator towards the adapter plate. Start all nuts onto the studs and tighten them with the proper open end wrench.

4. Remove the indicator cap. Using the hand wheel, turn the hand wheel gear shaft so that the key slot on the stem and operator are aligned with each other.

5. Using a rubber mallet, tap the key gently into the key slot until it is below the top of the stem. **Do not use excessive force to drive the key**. If the key does not fit properly, recheck the alignment of the key slots. If the key sticks out above the end of the stem slightly rotate the gear shaft to make sure the key is engaging the adapter plate groove. Another key or punch should be used to drive in the key to prevent damaging the gear operator key slot.

6. Loosen the locknuts and rotate both stop screws on the gear operator counter clockwise.

7. To set the closed stop, turn the hand wheel gear shaft clockwise until the key stops on the adapter plate groove. Back off a quarter turn, then turn the close position stop screw clockwise until it stops and tighten approximately 1 Ft-lb. for each inch of valve bore. Retighten the locknut. **The hand wheel gear shaft should always be turned in the closed direction to set the closed stop, so that all slack will be taken out of the gearing. This ensures a more accurate stop setting.**

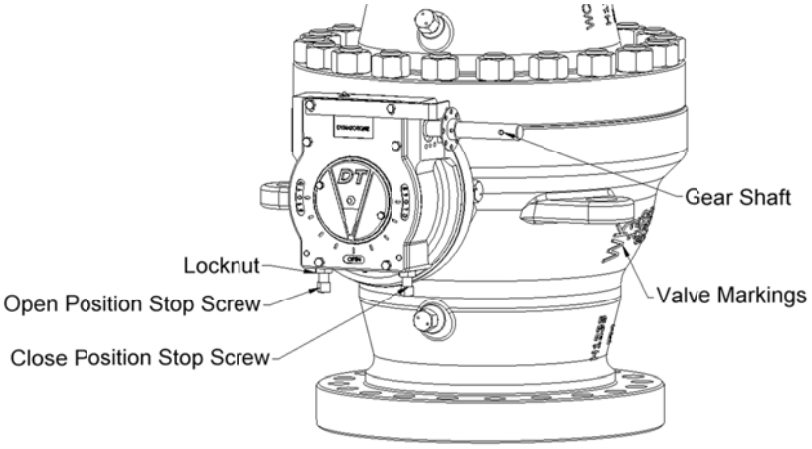

Figure 16 – Gear Operator Assembly

8. After setting the closed stop a quick check can verify that is has been correctly set. Turn the hand wheel gear shaft towards the open position, and then return the valve to the closed position until contacting the closed stop. After fully closing the gear, mark the ball with a circle tangent to the adapter flow bore (or body flow bore) in a plane 90° with the stem axis. Open the ball halfway and measure the minimum distance from the ball corner (ball flow bore to sphere corner) to the mark. The distance should meet the dimension L detailed in Table 9.

Table 9 – Dimension L

Distance from Ball Corner to Mark		
Valve Size	Valve Class	Dimension L (+/- 0.04")
2" FP & 3" RP	150-900	0.67"
2”FP	1500	0.96"
2”FP	2500	1.28"
3”FP & 4”RP	150-900	0.87"
3”FP	1500	1.19"
3”FP	2500	1.81"
4”FP & 6”RP	150-900	1.03"
4”FP & 6”RP	1500	1.24"
4”FP & 6”RP	2500	1.87"
6”FP & 8”RP	150-600	1.05"
6”FP & 8”RP	900-1500	1.37"
8”FP & 10”RP	150-600	1.19"
8”FP & 10”RP	900	1.40"
10”FP & 12”RP	150-900	1.35"
12”FP & 14”RP	150-600	1.50"
12”FP & 14”RP	900	1.74"
14”FP	150-600	1.56"
16”FP	150-600	1.87"

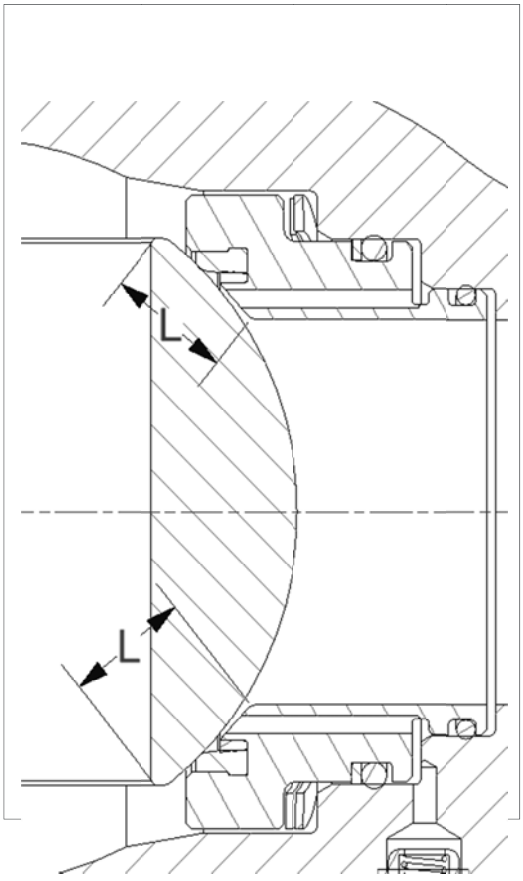

Figure 17 – Dimension L

9. To set the open stop, turn the hand wheel gear shaft counter clockwise until the key stops on the adapter plate groove. Look into the bore of the valve, the flow bore of the ball should be aligned with the flow bore of the seat assembles with not more than 1/16” of the ball radius protruding into the flow bore. Turn the open position stop screw clockwise until it stops and tighten approximately 1 Ft-lb. for each inch of valve bore. Retighten the locknut. **The hand wheel gear shaft should always be turned in the open direction to set the open stop, so that all slack will be taken out of the gearing. This ensures a more accurate stop setting.**

10. After setting the open stop a quick check can verify that it has been set correctly. Turn the hand wheel gear shaft several turns towards the closed direction, and then return the valve to the open position until the key hits the stop. There should be no more than 1/16” of the ball radius exposed into the flow bore after the stop if properly set.

11. Reinstall the indicator cap and tighten the indicator cap screws.

12. Install the hand wheel and secure it with the hand wheel pin.

ASSEMBLY TORQUE VALUES

TROUBLESHOOTING

Table 9 –Troubleshooting

Issue	Probable Cause	Repair
Will not open or close	Iced up due to restricted flow or low temperature	Inject antifreeze solution into valve body. Check the compatibility of antifreeze solution to avoid damaging the seals. Drain periodically to eliminate water accumulation
	Improper setting of gear or actuator stops	Reset gear or actuator stops
Hard to operate	Accumulation of foreign material in the body	Drain the valve – see drainage procedure
	Infrequent operation, lack of lubrication	Grease the valve – see lubrication procedure
	Gear hard to operate or stuck	Check gear. Lubricate or replace
	Operator not properly installed	Check gear operator
Leak around the seat	Foreign material between seat and ball	Grease the valve – see lubrication procedure. Operate several times to wipe clean
	Valve not fully closed	Check the adapter plate or gear operator for fully closed position
	Worn or damaged seat inserts and/or ball	Disassemble the valve and replace worn parts
	Operator stops not properly set	Adjust stops to proper settings
	Worn or damaged seat O-ring seal	Disassembly the valve and replace seat O-ring. Check O-ring material for application*
Leak around stem	Worn or damaged stem O-ring seal	Grease the stem. Disassemble the valve and replace stem O-ring. Check O-ring material for application*
Leak between body and adapter plate	Worn or damaged adapter O-ring seal	Disassemble the valve and replace adapter O-ring Check O-ring material for application*
	Adapter studs and nuts not properly tightened	Tighten nuts to specified torque
Leak between body and lower cover plate	Worn or damaged lower cover plate O-ring seal	Disassemble the valve and replace cover plate O-ring Check O-ring material for application*
	Cover plate cap screws not properly tightened	Tighten cap screws to specified torque
Grease fitting leaking	Debris in the fitting	Inject small amount of cleaner to flush debris
	Damaged fitting	Tighten safety cap or replace fitting. WARNING: Never remove the entire fitting with the valve under pressure

*Contact a WKM representative for proper trim selection for the required application

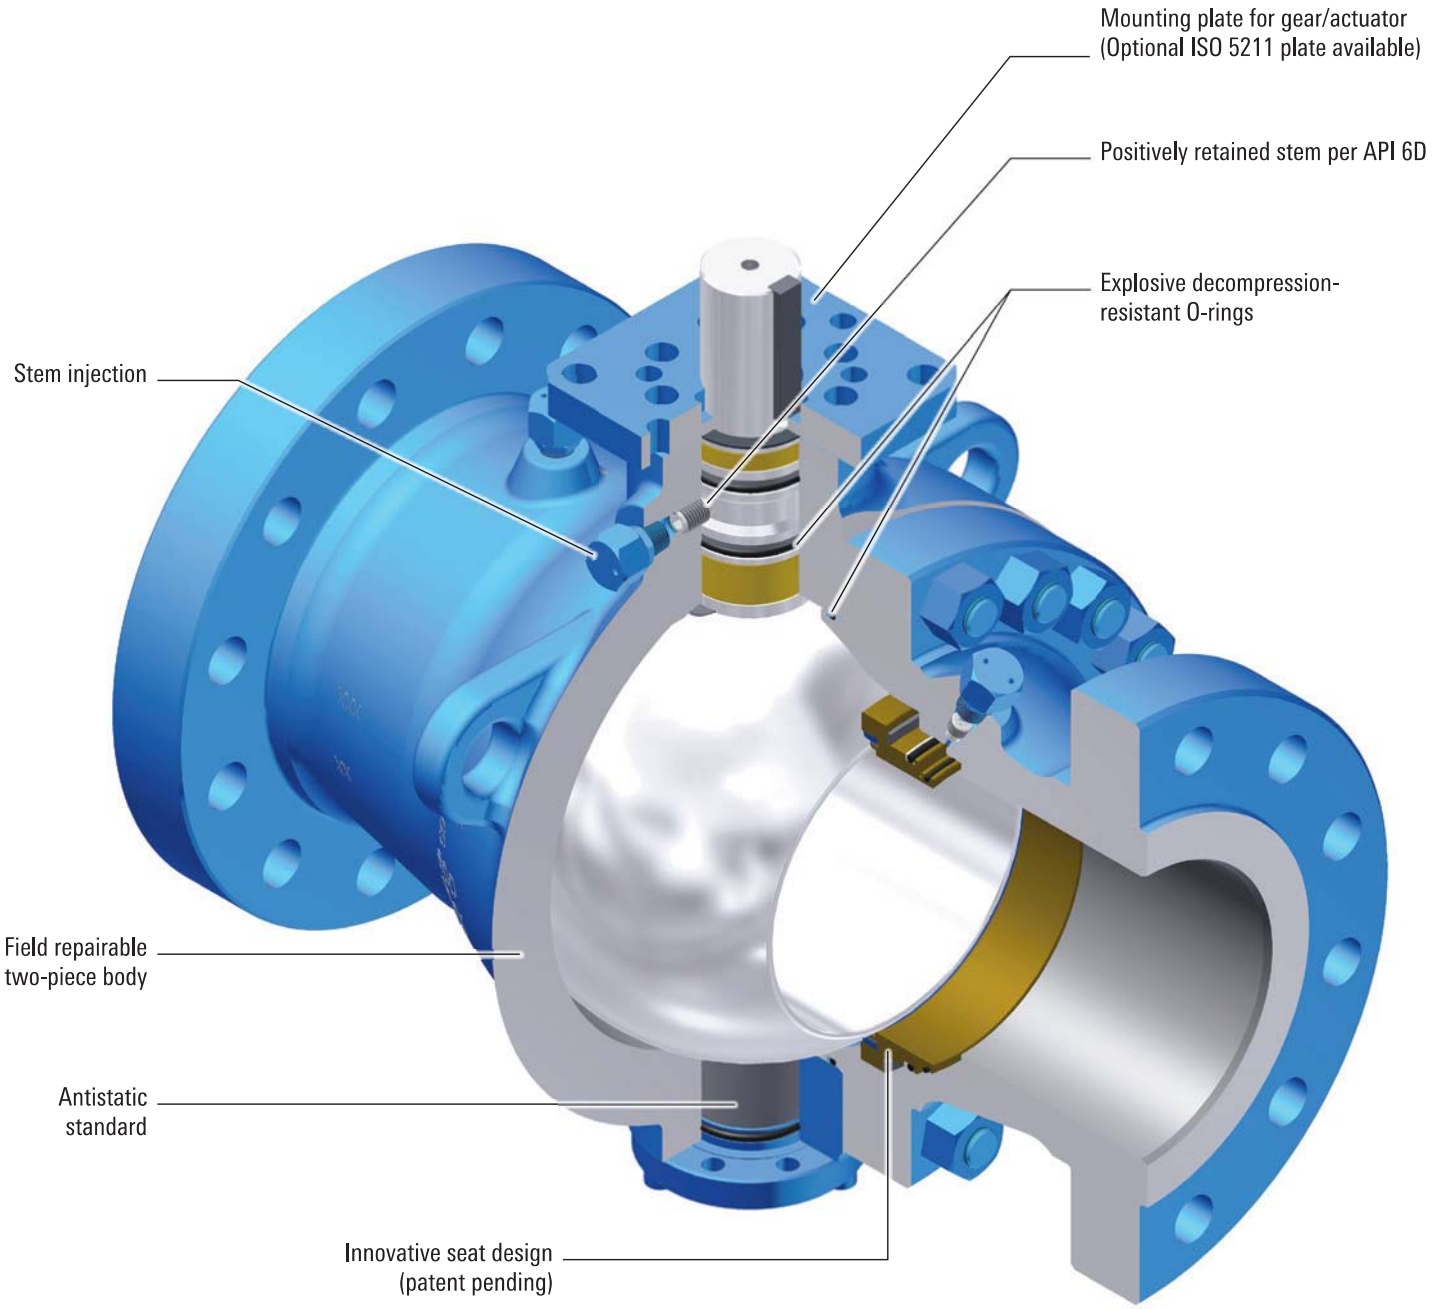
WKM 370D6 Trunnion-Mounted Ball Valve

Cameron is a leading provider of valve, valve automation, and measurement systems to the oil and gas industry. We offer products primarily used to control, direct, and measure the flow of oil and gas as it is moved to refineries, petrochemical plants, and industrial centers for processing.



We provide valve products that are sold through distributor networks worldwide. Our products are used in oil, gas, and industrial applications, and include widely recognized brands such as DEMCO*, NAVCO*, NEWCO*, DOUGLAS CHERO*, NUTRON*, THORNHILL CRAVER*, TECHNO*, TOM WHEATLEY*, WHEATLEY*, and WKM*.

The WKM* 370D6 trunnion-mounted ball valve is recognized throughout the world for durable, reliable, and flexible valves built for many challenging situations. Our WKM product line offers a broad portfolio of valves including gate valves, trunnion mounted and floating ball valves, and DynaCentric* butterfly valves, all built to standards for demanding applications.

ASME Classes 150 through 2500

2 to 16 in [50 to 400 mm]

WKM 370D6 ball valves are designed and engineered for heavy-duty performance. Used in many general purpose petroleum and chemical process applications, these valves also can be specified for more demanding applications.

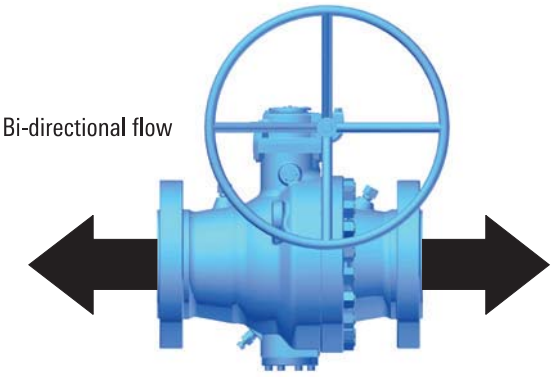
Features and benefits

Fire-tested for safety
The WKM 370D6 ball valves are qualified under API 607 standards.

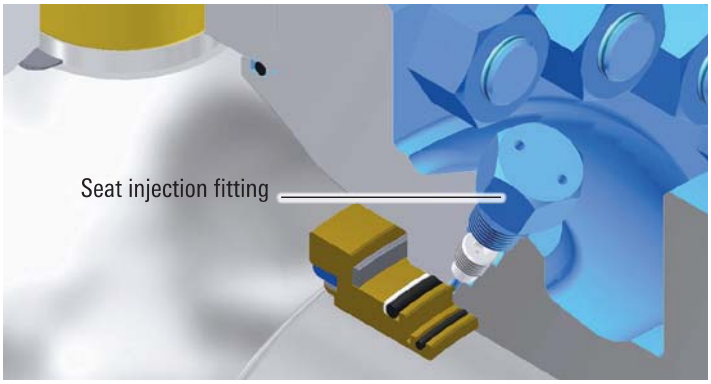
Actuation-friendly
Valves can come with a DYNATORQUE* gear operator or an ISO 5211 mounting pad for easy actuation.

End connections
Flanged; 2-, 3-, and 4-in Class 150 come in flanged × studded or flanged × flanged configuration

Body style
Two-piece

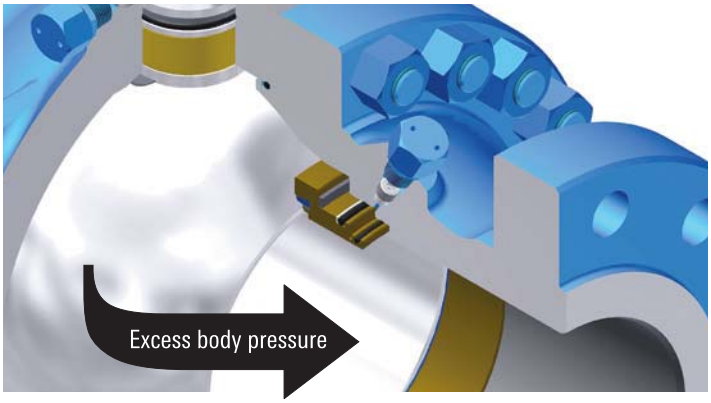


Standard materials
Carbon steel, stainless steel, and low-temperature carbon steel



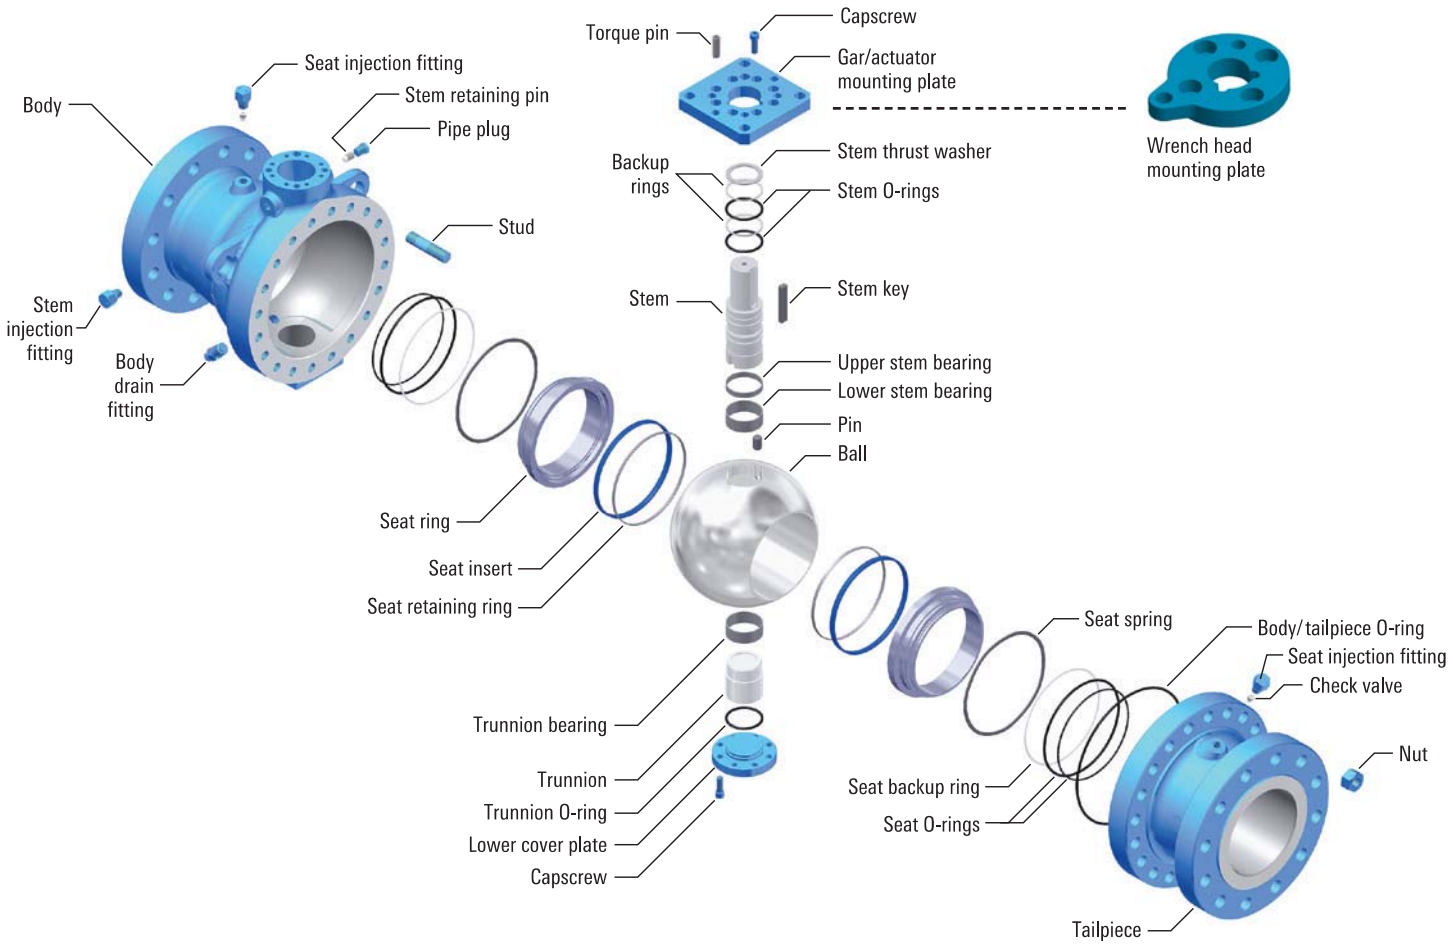
Optional stem materials
316 SS, 410 SS, 4130 LAS, and INCONEL†

Double block-and-bleed operation
The pressure-actuated seats and bleed fittings allow double block-and-bleed operation. When used for block-and-bleed, this feature may permit the valve to take the place of two valves. It also allows the operator to check up and downstream sealing by bleeding off the body pressure. All sizes can block-and-bleed in both the open and closed position.



NACE trim standard‡
Compliant with NACE MR0175/ISO 15156 for buried service.

Bi-directional flow
This valve uses pressure-actuated seats with locked-in, non-metallic face seals. To help ensure sealing at low pressure, special wave springs force the seats against the ball. At higher pressures, the upstream seat is forced against the ball by the pressure working across the differential area between the seat insert and the seat O-ring. The higher the pressure, the tighter the seal.



Secondary seat seal injection
In the event of damage to the valve seat, sealant can be injected to temporarily seal the valve.

Automatic body pressure relief
Seats will internally relieve excess body pressure.

‡ NACE MR0175/ISO 15156 Compliance—Materials of construction shall be in compliance with the pre-qualified material requirements specified by NACE MR0175/ISO 15156. According to NACE MR0175/ISO 15156, it is the manufacturer's responsibility to meet metallurgical requirements and the customer's/user's responsibility to ensure that a material will be satisfactory in the intended environment. When given the application requirements (environment) by the customer/user, Cameron can make technical recommendations in accordance with NACE MR0175/ISO 15156, but that in no way certifies or warrants the product or materials for the application.

Standards and specifications

Design and testing standards:

- API 6D
- API 598
- API 608
- API 607 6th Ed. fire-test
- NACE MR0175/ISO 15156
- ASME B16.34 (valves, flange end)
- MSS-SP-6 (standard finishes for pipe flanges)
- MSS-SP-25 (standard marking system for valves)
- MSS-SP-55 (quality standards for steel castings)

In addition, WKM 370D6 trunnion mounted ball valves can be supplied to comply with these standards:

- CE/PED
- ISO 5211 top works
- CRN

	300	286–740	13,149	6,237	36,792
	600	741–1,480	23,638	7,295	69,591
	900	1,481–2,220	30,433	8,013	69,591
12 [300]	150	0–285	11,601	6,311	36,792
	300	286–740	21,179	7,430	69,591
	600	741–1,480	31,608	8,405	69,591
	900	1,481–2,220	46,301	10,701	92,606
14 [350]	150	80–285	16,370	10,275	69,591
	300	286–740	26,595	11,555	69,591
	600	741–1,480	45,288	13,634	92,606
16 [400]	150	80–285	21,999	12,447	69,591
	300	286–740	39,436	14,326	92,606
	600	741–1,480	70,917	17,382	173,880

The above values are new valve torque values, where P is the maximum operating pressure (psig) of the valve.
The above torque values do not contain service factors.
Soaking effects and/or particle matter in the valve may cause an increase in the torque.
The re-seat torque is equal to ~80% of the break torque.
For power operation, multiply all of the above values by a minimum factor of 1.25 or customer specified factor whichever is larger.
For operating temperatures between –20 to –50 degF (–29 to –46 degC) multiply these values by 1.20.
Actuator selection should be made on customer experience and appropriate service factors.

Material Selection Guide

A selection of body, stem, and seat/seal materials for the WKM 370D6 ball valves are available. The following list is intended as a guide in the selection of materials for corrosive service. Material suitability is based on ladings at ambient temperatures. Other temperatures may render a given material/lading combination inappropriate. No material can be expected to resist all the many ladings found in modern industry. Experience has shown that certain materials can perform satisfactorily within certain limits. The physical properties of a material are affected differently by each corrosive medium. Therefore, it sometimes becomes necessary to sacrifice value in another property. As a result, the user must decide which property is of prime importance for his application. Internal moving parts, in contact with the lading, should always carry an "A" rating. Body materials with exposure to corrosive ladings can sometimes carry a "B" rating because metal loss due to corrosive is not as critical.

We strongly recommend that tests be run under actual operating conditions to obtain a material's performance ability in any one corrosive medium.
