

**1. TECHNICAL DATA**

## 1.1 Design basis

Ozone production	3x333 lb/d = 3x6,29 kg/h
Corresponding ozone concentration	2.5 wt %
Cooling water temperature	max. 75 °F = 24 °C
Ambient pressure	14,7 psig = 1000 mbar
Ambient temperature	85 °F = 29,4 °C
Relative humidity	max. 70 %

## 1.2 Feed gas

Feed gas	Air
System pressure	17 psig = 1,17 barg.
Mass flow	3x13320 lb/d = 3x251,6 kg/h
Gas temperature	approx. 77 °F = 25 °C
Dew point at 1 bar	max. -76 °F = -60 °C
oilfree	
dustfree	

### 1.3 Ozone generator

Number of operating units	3
Type of ozone generator	OF 209 L
Ozone production per ozone generator	333 lb/d = 6,29 kg/h
Corresponding ozone concentration	2.5 wt%
Ozone gas pressure	17 psig = 1.17 barg.
Corresponding mass flow	13320 lb/d = 251,6 kg/h
Cooling water flow rate per ozone generator	84 gpm = 19 m/h
Temperature increase of the cooling water	9 °F = 5 °C
Energy consumption from the mains	max. 8,5 kWh/lb ozone = 18,7 kWh/kg ozone
Dimension drawing for ozone generator	HISW 493 428

2. PLANT DESCRIPTION

2.1 Ozone generation

The ozone generator consists essentially of two parts:

- the ozone generator vessel (OGV) and
- the power supply unit (PSU)

The ABB ozone generator consists of a horizontal cylindrical vessel with flanged dished ends provided with ozone resistant gaskets. All parts in contact with the feed gas and the ozone gas are fabricated in stainless steel. A specific number of stainless steel tubes are welded between the end plates of the cylindrical body section.

The energy not used in the production of ozone is removed by cooling water flowing around the outside of the ss-tubes.

The ss-tubes (earth electrodes) serve as receptacles for the calibrated glass tubes which are metallized on their inside surface (high voltage electrode). The glass tubes are held in the centre of the steel tubes by means of specially designed centering springs. The outside diameter of the glass tubes is dimensioned so that a small circular gap exists between them and the earth electrodes in which they are placed.

Each high voltage electrode is fitted with its own contact brush and fuse. The fusing of each electrode ensures the separation of any defective electrode from the others thereby allowing the operation of the ozone generator to continue without interruption.

The high voltage applied between the metallized glass electrodes and the ss-electrodes produces a silent

electrical discharge across the circular gap. Under the influence of this discharge ozone is formed continuously in the feed gas stream. The gas leaving the ozone generator will have the specified ozone concentration when operating under design conditions.

The power supply unit (PSU) serves to provide power for and control of the ozone generator. Its main components are:

- Main switch
- Main breaker
- Current rectifier controller (CRC)
- DC-choke (DCC)
- Current inverter (CI)
- High voltage transformer (HVT)
- Programmable logic control system (PLC)

The operation of the power components is such that the 3-phase current rectifier controller generates a regulated direct current in the DC-intermediate link independent of fluctuations of the mains voltage and load. The DC-current is converted by means of a static inverter to rectangular pulses having higher frequency and elevated to the required voltage for the operation of the ozone generator <sup>800/</sup> ~~10,100 VAC~~. The DC-choke, installed between the current rectifier and the inverter, serves as a separation of the incoming and outgoing circuits, for DC-current smoothing and energy storage.

The power supplied by the PSU to the ozone generator can be controlled either manually by means of the current set point adjustment potentiometer situated on the front panel of the PSU cabinet or by a remote set point.

The ozone generator is protected by the following external interlocks:

- OGV cooling water discharge temperature too high
- OGV supply cooling water flow too low
- Feed gas flow too low
- Feed gas pressure too low

These interlocks provoke an immediate shut down of the PSU with alarm release.

## 2.2

### Operating modes

#### Local manual operation

By turning the switches "control local/remote" and "set point local/remote" to the "local" position, the ozone generator can be switched on/off and the power supplied by the PSU to the OGV can be controlled by the potentiometer "set point" both manually locally.

#### Automatic starting

It is possible to start the ozone generator automatically. In this case, the operating step sequence shall be as given in section 6.5.2 hereafter.

#### Automatic shut down

The ozone generator shall be shut down according to the sequence given in section 6.6 hereafter.

#### Emergency shut down

In emergency case, the ozone generator is stopped immediately.

#### Oberflächenbehandlung

Metalle absolut ölf- und fettfrei.  
Glaselektroden: Aussenfläche mit ethylalkohol geträufeltem Lappen abreiben. Mit sauberen Tuch abtrocknen. Nicht mit den Händen berühren, Handschuhe benutzen!

#### Surface treatment

Metal parts absolutely oil- and grease free.  
Glass electrode: Clean external surface with ethylalcohol. Dry with a clean rag.  
Don't touch the glass with the hand, use gloves!
