### Norton No. 6DB Deep Throat Flypress & Stand

The Norton No. 6DB deep throat fly press is a manually operated machine used for a variety of metalworking operations, such as bending, punching, and shaping metal.

As the name suggests, the deep throat design of the press allows for a greater distance between the ram and the frame, making it possible to work on larger or more complex workpieces.

The machine is operated by manually rotating the flywheel, which drives the ram down onto the workpiece. The force of the ram is adjustable, allowing for a range of applications.

The Norton No. 6DB fly press has a sturdy cast iron construction, which provides stability and durability during operation. It also features a threaded adjustment system that allows for precise control of the ram's position and force.

Other features of the Norton No. 6DB fly press include a range of customizable options, such as different-sized rams and dies, and a range of accessories such as a V-block and angle plate for holding workpieces.

Overall, the Norton No. 6DB deep throat fly press is a reliable and versatile machine suitable for a range of metalworking operations. Its manual operation and adjustable force make it a popular choice for small workshops and hobbyists who require precision and flexibility in their metalworking operations. The deep throat design also makes it a valuable tool for working on larger or more complex workpieces.
