

From when it was first put on the market — the first wrapping machine for hard boiled sweets and pastilles of various kinds-with patented fully automatic feed which asserted itself throughout the world — the « 2350 » has successively been improved.

The « 2350/SUPER » through the adoption of a special patented system, can accomplish the **single-end** and **side-bow style of wrapping** on normal shapes at much higher speeds which reach fully 300 wrappings per minute and without altering its performance on the **double-end** twist which can reach speeds up to 350 wrappings per minute. Also the « Bon-bon » pointed style of wrapping, for which it is necessary to equip the machine with a special group supplied on demand, is accomplished on the « 2350/SUPER » at much higher speeds reaching 250 wrappings per minute. With the same group and at the same speed the « 2350/SUPER » also does the fold style of wrapping with the points heat-sealed under the base of the square sweets. There is no other automatic wrapping machine for hard boiled sweets on the market which can, as a single unit, accomplish all the operations obtainable on the « 2350/SUPER » and at such high speeds.

On the « 2350/SUPER » the patented automatic system for eliminating dust or crumbs and the patented improvements to the feeding system permit the automatic feeding of sweets, including square ones, and nearly all the rectangular shapes, with a consequent saving in labour costs, since one operator is sufficient to take charge of and supervise a group of these machines.

It is also possible to wrap soft-centre sweets with a high degree of filling, or sweets of special shapes (the machine being supplied with the necessary equipment for hand feeding of those products which, because of their shape or consistency, are unsuitable for automatic feeding) as it is also equipped with a speed variator so that the speed can be adjusted to suit the shape and consistency of the products and the resistance of the wrapping materials.

A choice of wrappings can be obtained by using wax-paper or cellophane, with or without understrip of wax-paper or lined foil, taken from reels. For the eventual centering of the print, the machine can be supplied on demand, with a photoelectric cell.

The machine adopts new conceptions, covered by patents, for the accomplishment of the wrapping by means of two pincers only, the operation of the crimpers, the feeding of the products, etc., etc., which give perfect and artistic wrappings.

By changing the feeding plates a great variety of shapes can be wrapped.

The change-over from one size to another or of type of wrapping by means of interchangeable parts does not require skilled labour and is a very fast operation. The « 2350/SUPER » can be supplied, on demand, in a special model without automatic feed.

All working parts of the « 2350/SUPER » are thoroughly protected although readily accessible and the simplicity of operation and maintenance render it a well-appreciated favourite amongst both operators and engineers. Cleaning can be very swiftly and thoroughly accomplished.

In case of breakage or termination of the understrip or of the external wrapping material, the machine stops automatically and an audible signal warns the operator. Automatic feelers avoid waste of wrapping material when the products do not reach the wrapping station.

The perfect design and proportions of each part, assembly on ball or roller bearings, automatic lubrication, employment of the best materials and accuracy in workmanship, give the « 2350/SUPER » an exceptional degree of safety and place it in the forefront for superiority in operation, long life, and reliability with high production results.

Floor space-required: 1400 x 1400 mm. - Net weight: approx. 900 Kilos - Power required: 1 HP.
