Interactive Manual Data Input Function

ONE-TOUCH IGF

OSP5020L CNC SYSTEM

OPERATION GUIDE (3rd Edition)

TABLE OF CONTENTS

PAGE

SECTION 1 ONE-TOUCH IGF OPERATION 1

1. Machining Method Definition 1
2. Three Operation Procedures 3
3. Changing the Automatic Determination Rule 5
4. Tool Data and Prior Tool Designation 8
5. Material Data 10
6. Process Determination Conditions and Parameter Setting 11
7. Machining Shape and Blank Material Shape in the Machining Process 13

SECTION 2 ONE-TOUCH IGF OPERATION EXAMPLES 14

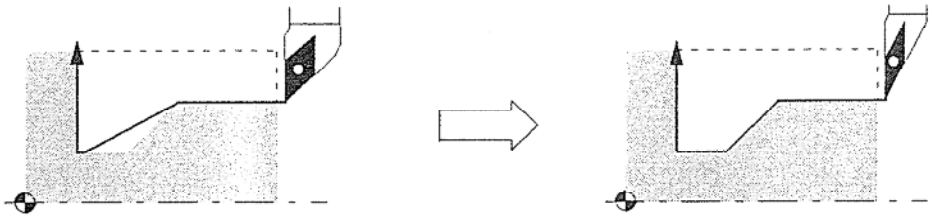
1. Example 1 (two-touch course) 16
2. Example 2 (two-touch course) 22
3. Example 3 (two-touch course) 28
4. Example 4 (two-touch course) 35
5. Example 5 (two-touch course) 43
6. Example 6 (two-touch course) 52
7. Example 7 (two-touch course) 59
8. Example 8 (two-touch course) 68
9. Example 9 (IGF course) 75
10. Example 10 (two-touch course: two-saddle specification) 85
11. Example 11 (two-touch course: two-saddle specification) 92
12. Supplement (Part Program Output Example) 105

PAGE

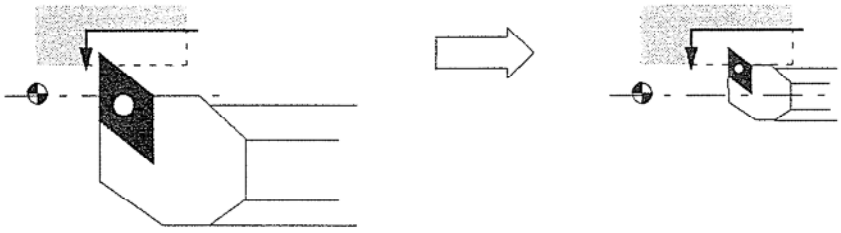
SECTION 3 HOW TO USE PROCESS DETERMINATION CONDITIONS 110

1. Prior Tool Designation 113

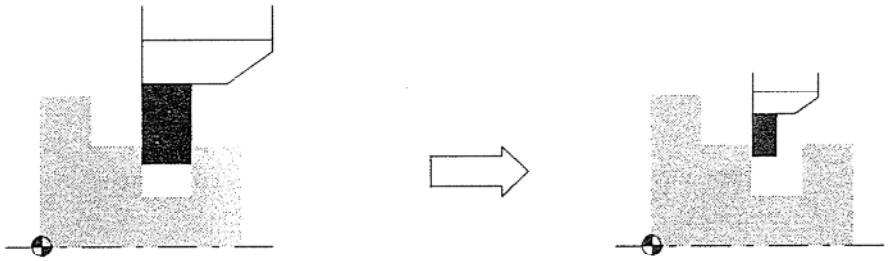
(1) When Tools with Different Tool Angle and Edge Angle are Registered 115



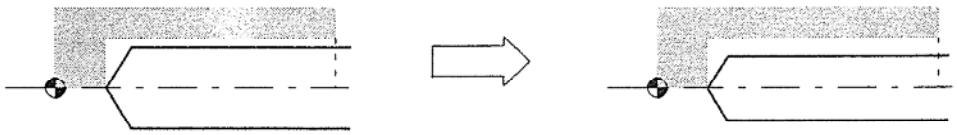
(2) When Tools with Different Holder Diameter are Registered 116



(3) When Tools with Different Tool Width are Registered 117



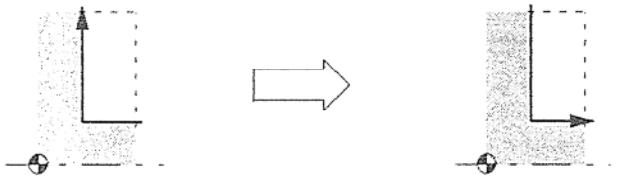
(4) When Drills with Different Drill Diameter are Registered 118



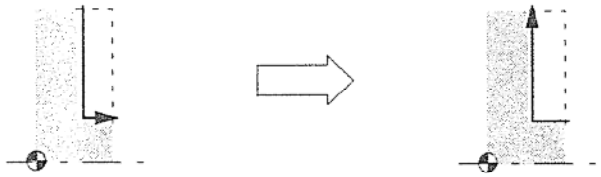
PAGE

2. FACE/LONG DECIDING DATA 119

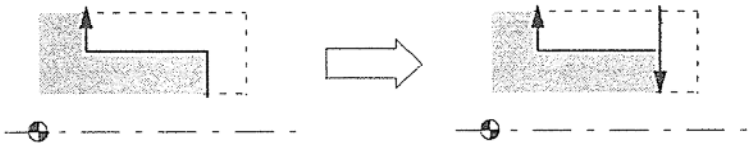
(1) Changing From LONG to FACE in the Roughing Cycle 120



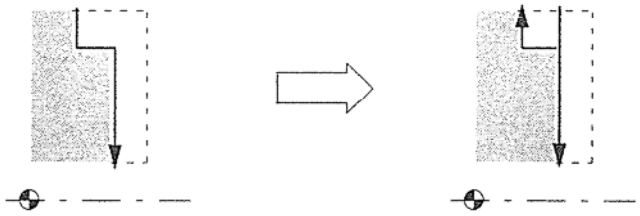
(2) Changing From FACE to LONG in the Roughing Cycle 122



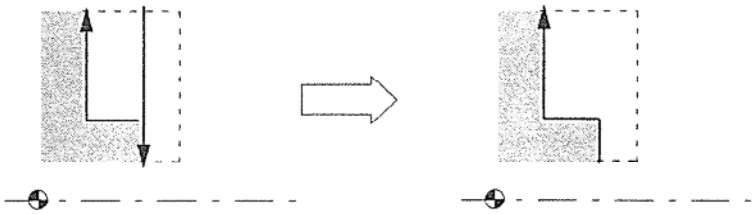
(3) Process Division in the Roughing Cycle (LONG → FACE + LONG) 123



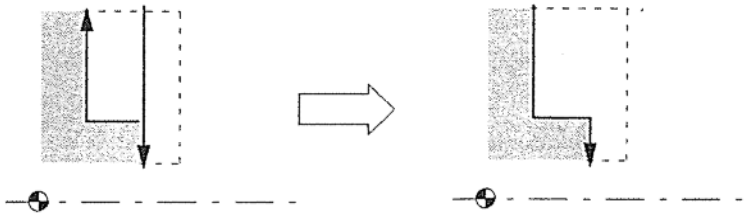
(4) Process Division in the Roughing Cycle (FACE → FACE + LONG) 125



(5) Process Integration in the Roughing Cycle (FACE + LONG → LONG) 126

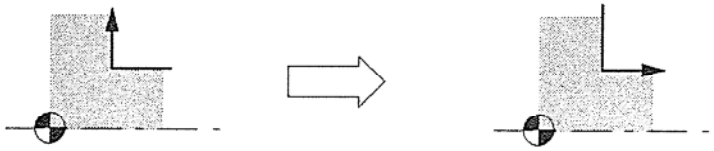


(6) Process Integration in the Roughing Cycle (FACE + LONG → FACE) 127

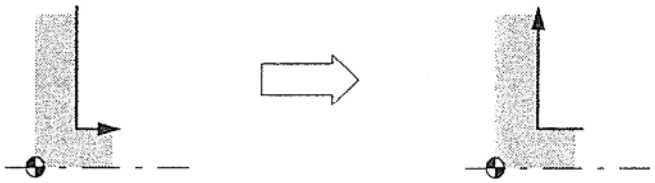


PAGE

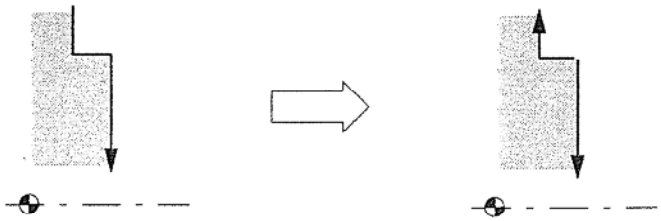
(7) Changing From LONG to FACE in the Finishing Cycle 128



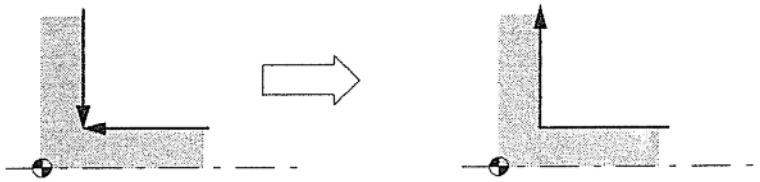
(8) Changing From FACE to LONG in the Finishing Cycle 130



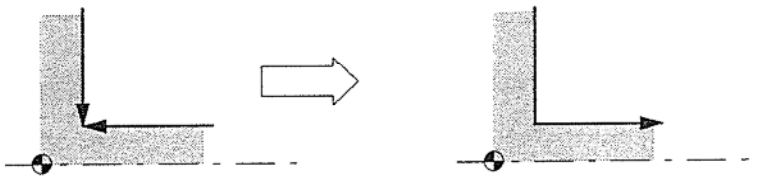
(9) Process Division in the Finishing Cycle (FACE → FACE + LONG) 131



(10) Process Integration in the Finishing Cycle (FACE + LONG → LONG) 132



(11) Process Integration in the Roughing Cycle (FACE + LONG → FACE) 133

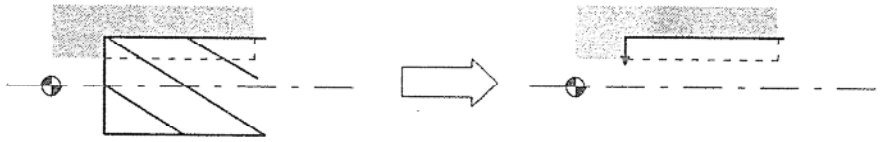


(12) To Carry Out Single-process Machining Either by a Longitudinal Machining Process or by an End Face Machining Process 134
- To always select a longitudinal machining process for the roughing process
- To always select an end face machining process for the roughing process
- To always select a longitudinal machining process for the finishing process
- To always select an end face machining process for the finishing process

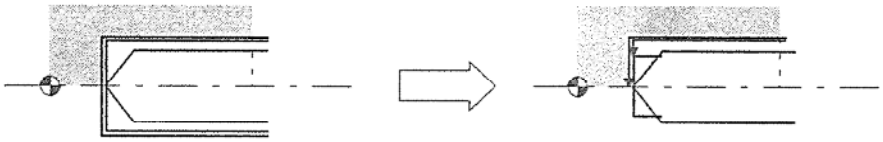
PAGE

3. Inside Machining Data 140

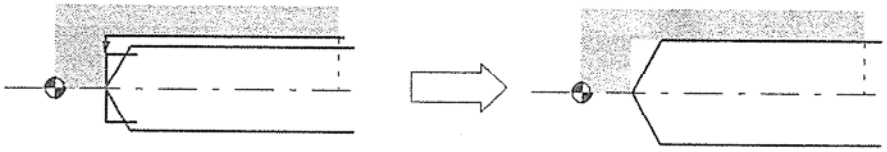
(1) Changing the Tool to be Used from an Endmill to a Boring Bar for Through-hole Machining 141



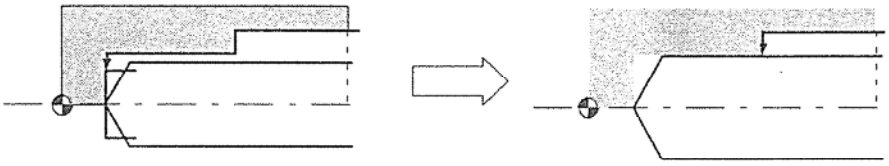
(2) Changing the Tool to be Used from an Endmill to a Boring Bar for Blind-hole Machining 142



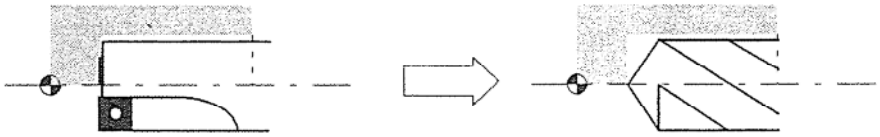
(3) ID Machining Using Only a Drill (no other machining process than drilling) . . . 143



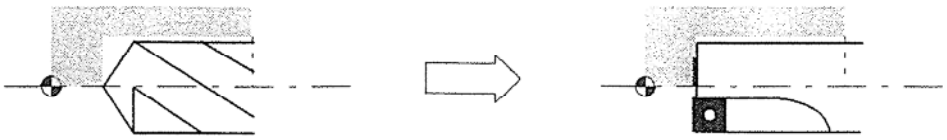
(4) ID Machining Using Only a Drill (other machining process is carried out in addition to drilling for ID machining) 144



(5) Changing the Type of Drill (carbide drill → HSS drill) 145



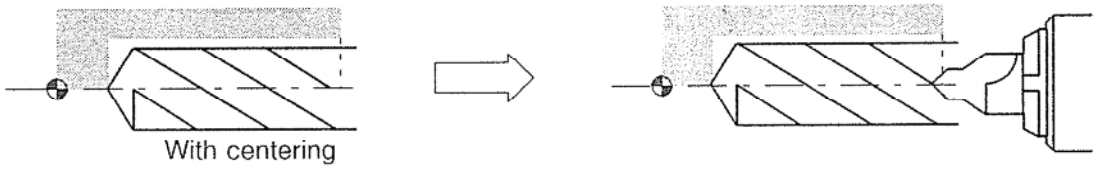
(6) Changing the Type of Drill (HSS drill → carbide drill) 146



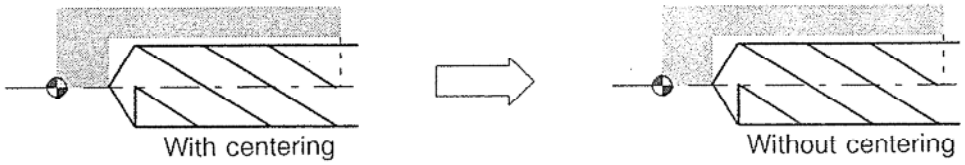
PAGE

(7) To Machine the Workpiece Using either Only a Carbide Drill or Only a HSS drill 147

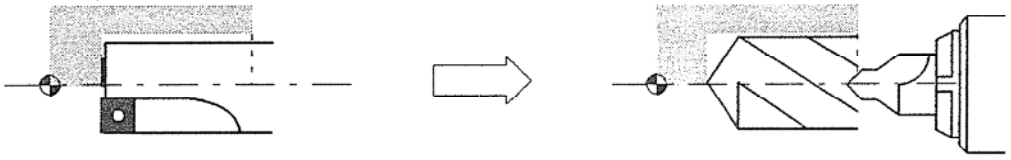
(8) Changing the Centering Tool 148



(9) Designating Whether or not Centering is Carried Out (HSS drill: with centering → HSS drill: without centering) 149

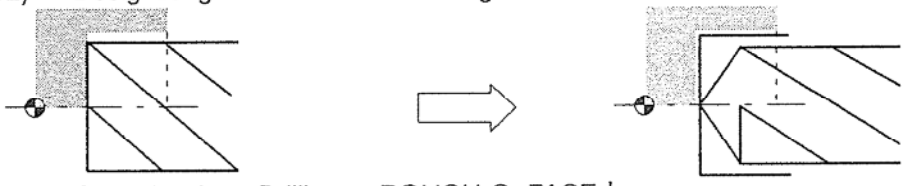


(10) Designating Whether or not Centering is Carried Out (carbide drill: without centering → HSS drill: with centering) 150

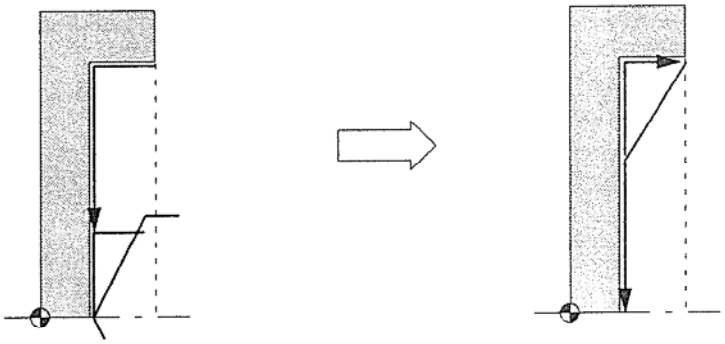


(11) Designating Whether or Not Centering is Always Carried out 151

(12) Designating Whether or not Drilling is Omitted 152



(13) Changing from Drilling to ROUGH O. FACE ↓ 153



PAGE

(14) Mechanism to Determine that a Boring Bar can not be Used for Machining .. 154
(15) Mechanism to Determine the Drill Diameter 155
(16) Mechanism to Determine the Type of Drill 156
(17) Mechanism to Determine Whether or not Centering is Executed 157
(18) Mechanism to Omit Drilling 158

4. Shape/Tool Position Data 159

(1) Variation of Automatic Process Determination Output According to the Setting at ROUGH SHAPE OUTPUT(0 = OFFSET, 1 = SHIFT) (machining shape in the roughing process) 161

(2) Variation of Automatic Process Determination Output According to the Setting at ROUGH SHAPE OUTPUT(0 = OFFSET, 1 = SHIFT) (surface roughness) 163

(3) Variation of Automatic Process Determination Output According to the Setting at ROUGH SHAPE OUTPUT(0 = OFFSET, 1 = SHIFT) 165

SECTION 4 QUESTIONS AND ANSWERS TO THE ONE-TOUCH IGF 166

Q1 : What must be checked before beginning with actual machining? 166

Q2 : The "chucking impossible" error occurs when automatic process determination is attempted. 169

Q3 : The "remained uncut area" error occurs when automatic process determination is attempted. 171

Q4 : Is it possible to cut the descending portion without using a tool for reverse-direction cutting? 174

Q5 : The tool registered as tool data cannot be selected. 179

Q6 : Is it possible to recess the workpiece in the OD turning process (ROUGH OD←, FIN. OD←, etc.)? 182

Q7 : Is it possible to carry out drilling after the ROUGH O.FACE ↓ process? (changing the machining sequence by changing the machining sequence parameter) 184

Q8 : Points to be taken care of in the finishing process when the final shape has a very small step. 186

Q9 : How can cutoff be executed? 187

Q10: Is there any problem when grooving the stepped shape? 192

PAGE

Q11: Is it possible to cut the workpiece using a straight tool? 195

Q12: Is it possible to cut the workpiece using a button tool? 196

Q13: What is the "cutting position (CUT PT CP)"? 198

Q14: What is the clearance set at the dimension parameter? 199

Q15: Is it possible not to retract the tool in the X-axis positive direction during approaching and retracting motions in the ID longitudinal machining processes (ROUGH ID← and FIN. ID←)? 200

Q16: How to cut the single groove, wide groove, or V-groove. 203

Q17: How to judge the groove to be a single groove or a wide groove. 204

Q18: How is the grooving tool width determined? 205

Q19: Is it possible to use the same tool for both the rough grooving process and the finish grooving process? 209

Q20: How is the thread cutting process created in automatic process determination? 210

Q21: How is the ID thread shape defined? 214

Q22: How is the tap shape in turning defined? 215

Q23: How are automatic chamfers generated? How is the surface roughness of automatic chamfers defined? 217

Q24: How to create a new machining process in the process edit mode by making use of the existing machining process 219

Q25: Is it possible to change the cutting direction with ease? 220
